The report proposes a four-legged stool structure for the university. It is clear that Engineering, AgriLife, and Texas A&M Health had input into the report and the recommendations. In some cases, their strategic plans are literally quoted in the report. It is equally obvious that no leadership or faculty in the proposed College of Arts & Sciences were consulted or had input into the report. If this college is to be part of the larger structure, it should have started with input into this report. The report clearly does not include the voice of faculty at all. The proposed realignments of departments are based on stereotyped ideas about disciplines, with no apparent knowledge of the disciplines as they actually are or of the work being done in the units. The re-alignments of departments make no sense. We have faculty who are experts in their disciplines and have experienced multiple administrative structures, and it is egregious not to consult them early in this process. We also have faculty who are experts in organizations and organizational structure, and it makes no sense not to consult their expertise (such as that centralizing often has negative effects). The decision regarding Biology is confusing, and poorly justified. Peer and aspirant institutions in fact do have biology departments in a college of Science (or Arts and Sciences). In addition to being consistent with those institutions, there are also benefits to keeping biology in Science (or Arts and Sciences). For one, this will put all pre-med curriculum broadly under one college. Centralization of advising was covered and this would allow for that for pre-med students within the new college framework. While in general, I am not opposed to a college merger, it would be helpful to have more details about this moving forward. Will Liberal Arts faculty be bumped in salaries to match those in the sciences? How will college level promotion and tenure guidelines be determined and handled? What will happen to teaching loads? Lab space? What sort of physical moves will be required, and how will this be handled in a way that minimizes the impact on ongoing research and teaching?

---

I do not particularly have a problem with the merging of the colleges but I am afraid that this will not be done well. The timelines for accomplishing these tasks is ridiculously short and faculty and staff are going to fall between the cracks. I

can only imagine how confusing it will be for students. I do not agree with moving biologically named programs in to COALS because they have biology in the title. I don't buy that students are confused by this. I do not agree with removing 2 high functioning programs out of Architecture. Doing that will basically gut Architecture who have built the status and reputation of the two programs in question.

---

The Libraries becoming a department under the College of Arts and Sciences would create immense bias under one specific dean. The likelihood of other colleges getting resources/databases/peer-reviewed articles/etc. would inevitably fall to a dean supporting very specific departments on campus. The Libraries as a resource for all would be compromised. We have 250 faculty and staff and around 200 student workers - we do not make sense to be a department. We should remain reporting to the provost as a college as we are part of student success.

---

A major recommendation involves combining the Colleges of Liberal Arts, Science, and Geosciences into one College of Arts and Sciences. I am concerned that this move, if done too quickly and without enough care, could cause a lot of disruption. Moreover, these three colleges are currently quite different, with their own strengths and weaknesses, and different cultures. My own College of Science is quite strong on its own, and we function well as a unit. We are concerned about becoming the (perceived) "College of service teaching", and would like to ensure that we receive continued resources commensurate with the value we add, so that we can stay strong. Moving Biology out of the College of Science, is likely the weakest recommendation in the report, and is basically unheard of among our peer and aspirational universities. Biology's natural home is with Science, and it fits quite well. I myself have collaborated with Biology faculty, etc. and it would be best suited to stay in our College.

---

I am a faculty member in the Department of Political Science, and I teach methodology courses. In my teaching, I aim to convey that mathematical methods are critical skills that are useful for academic research, for pursuing successful careers in the private sector, and for critically thinking about current affairs. In my research, I use the same methods to study the politics of leaders, and how they employ a variety of instruments to stay in office. I do have strong preferences for continuing to both teach and do research using this approach, with the existing division between these activities. (The recently implemented 2-1 teaching load is on par with top universities and is, in my opinion, important in allowing the retention and attraction of high-quality faculty.) I do not have strong feelings about the organizational structure in which faculty are embedded. To me, a department should give faculty the resources that enable them to pursue these activities and it should enable outside observers (such as grant givers, prospective students, and prospective faculty) with limited time to quickly learn that high quality work is being conducted in the department. With the latter goal in mind, I have some concerns that an unconventional structure like the one proposed in the report (as far as I know, no top university has merged their political science department with their policy school) would make it harder for outside observers to evaluate the research and teaching being conducted here---with potentially detrimental consequences for the prestige of the university, recruitment and funding. In other words, when trying to implement ambitious reforms without much precedent, a lot depends on how the reallocation and merger of the Department of Political Science with the Bush School would be implemented. The report offered few clues on this important topic, but I trust that the President and other decision-makers will take care not to jeopardize the strengths of the existing institutional structure.

---

I am a newly hired faculty at the Department of Biology, and it is a wonderful place to work. I would like that the Department of Biology stays as it stands in the College of Science. Otherwise, this will hamper my ability to continue my research program at TAMU and be able to apply for federal funds.

---

I am an Assistant Professor in the Biology Department. I am writing because I strongly believe that the Biology Department should remain a department in the College of Science (or a new College of Arts and Science). The strength and size of the department played a large role in my decision to take a faculty position at TAMU instead of pursuing offers at the other universities where I interviewed. Having a broad biology department collects a broad range of expertise, technical approaches, and points of view that greatly enhance the science that can be done. Being part of the College of Science allows interactions with the other departments that have been incredibly valuable. For instance, I regularly interact with the Chemistry Mass Spec Core which has expertise in small molecule analysis. In addition, I have a mentor in the Math Department who has really helped me succeed at TAMU. Since I have joined the department, I have seen and been part of the department enjoying a great deal of success. The department has far exceeded the teaching standards set by the university, while also securing tens of millions of dollars in new grant funding each year. In 2021, the tenured or tenure-track faculty have published more than 70 papers, so far. In all aspects of our mission, the department is excelling, due in large part to the support the faculty receive from each other and from the other departments in the College of Science. With the help of the support from the department and college, I was able to secure a major NIH

grant in less than two years of becoming a faculty member, bring great graduate students and undergraduate students into my lab, and hire a successful postdoc. With the help of my lab, I will have published three papers as corresponding author in less than 2.5 years running my lab. None of this would be possible without the support from the Biology department and the College of Science. For all of these reasons, I firmly believe that the continued success of the faculty in the department and our continued success in recruiting new faculty depends on maintaining our current organizational structure.

---

Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences: Although in the entire nation, Biology always belongs to College of Science, however, College of Science and Arts can be combined together, but combining with Geoscience and agriculture is not a great idea. I have seen agriculture always separate from Biological science, in my graduate school (Purdue University), Agricultural and Biological engineering belongs to the School of Engineering, not in the school of Science. Also, in the entire nation, Agriculture/Ag school always belongs to a separate school NOT in the School of Science.

Recommendation #5: Create the new Institute of Biological Life Sciences which will contain the Department of Biology and the Biomedical Sciences Program: No, not a great idea. "Department of Biology is underperforming" is absolutely a FALSE statement given the fact that, in 2021 alone, we received external awards totaling over \$21 million, we have amazing teaching records, excellent diversity records.... everything clearly shows an extremely successful department. Please DO NOT combine us with Agrilife, we are doing great as it is, and we will continue to excel in the future.

---

The report reflected severe inaccuracies in its understanding of Academic Libraries and Librarians with faculty status, particularly in context of Land Grant institutions. This can be seen looking at Ohio State University, Penn State University, Florida State University but also at University of Florida and University of Illinois at Urbana-Champaign. Faculty status for Librarians within the Libraries is often associated with Land Grant universities and never overlapped with LIS degree granting departments. There is no model among US academic libraries of placing the actual Libraries or Library Employees (regardless of faculty or staff status) under the auspices of a particular college because the role of the library is to support students, faculty, and research initiatives across ALL colleges. Regarding a new LIS bachelor's level program, Texas already has 3 fully accredited Library and Information Science Degree granting programs at the Master's level. There is no market for a Bachelor's program in Library and Information Science And I would be surprised if such a program were approved by the Texas Higher Education Coordinating Board. Regarding the Cushing Memorial Library, while it does offer exhibits, it's primary role is that of the official University Archives and development of research based collections of books and manuscripts. Placing it under museums, reflects a significant misunderstanding of its fundamental purpose. The role of the University Archivist under the University Libraries is documented in System and University policies.

---

Finding 9, Rationale 9c: Academic Realignment Comments for Finding 9, Rationale 9c: Context for Architecture Education: Without expanding too much on the depth of architectural education, I'll provide some more context to the finding and recommendations made. Apologies for the lengthy comments. 1. Architecture is both a Field of Thought (discipline) and Creative Pursuit as much as it is a Profession. 2. Architecture as discipline is linked to traditions of thousands of years. 3. The profession and registration of architecture is barely 100 years old. 4. Curiously, the world that shaped the discipline prevails (social, political, cultural). The one that shaped the profession—tied to industrialization, technological advancement, and public safety, has significantly evolved in time. The initial needs of the profession are far from the same. Yet the overall questions of how do we live together, how and why we build, etc., remain the same. 5. Most importantly, the "subjects," this is, the students who go to college are significantly different from the those before the 1970s, but even more before of those before the 21st century. 6. All models of architectural education are, generally speaking, outmoded. Some work better and offer the opportunity for adjustment moving forward. 7. We have a Bachelor of Environmental Design (BED) program forcibly linked to a specific 2-years Master of Architecture program. This is both an administrative constraint but primarily a historical-disciplinary debate. The 1960s, in its known upheavals, created many questions about the role of education. Architecture was not exempt. The BED emerged only in part as a critical response to architecture's past as top-down, power related field, intending to acknowledge the complexity of "building" (as verb), in relation to an emerging "environmental world." The other major interest of the BED programs was to, different to the professional Bachelor of Architecture (BArch) of 5 years of education, you could do 4+2, and with one more year in school obtained a higher, Master degree. This was a transactional consideration. 8. The 4+2 model is outdated and outmoded. Students entering the BED today have far less consciousness of what architecture or the environment entails (in neither disciplinary or professional terms). The main problem is treating—which happens in our department, the BED as a BArch, which "forces" students to "really commit to architecture" when

they barely manage future expectations. Many realize along the way that they prefer careers in design (associated historically to architecture as well), like graphic design, industrial design (objects, furniture), but also Urban Design, or Urban Planning, as well as a variety of career paths that stem from the diverse education architecture as discipline is tied too. Others plainly do not fit, or move to other great fields. The Department is then “forced” to “pipeline” students into the 2-year Master of Architecture program that is treated as a very reductive professional compliance degree. There’s no mastery in the MArch. Students are combined with others and the misalignment and misunderstandings about what they are doing abound. Our best BED students rush to do their Master of Architecture degree somewhere else, more prestigious, including all of the Ivy League universities and comparable schools across the country. The least motivated students remain in our program. 9. The BED is a non-professional degree, it does not require accreditation by the National Architectural Accrediting Board (academic accreditation, professional registration is NCARB). The 2-year program, a very small program, will never be able to rank better since ranking depends on larger amounts of students graduating who then become a network who fill the ranking surveys and increase our rating. The BED is not ranked because non-professional degrees are not ranked overall. 10. There are two paths forward. (1) Increase the quality of the BED program by making it less “architecture enforcing” and more “environmental design.” This means to teach architectural content in dialogue with the many scales needed to confront our challenges (from furniture to territory). This would allow the creation of new Master-level Programs within the new College of Architecture. By liberating the BED from “professionalization” which is currently an overkill, we would need to upgrade our Master of Architecture to a 3-years program, fully accredited, and with a much better capacity to increase ranking since the main schools offer this degree at the master level. With a three-year Master of Architecture level we can greatly increase registration from the country and international, expand on the richness of the discipline of architecture and comply with professional requirements. Currently, the whole of the BED+MArch are subjected to, profession and industry, instead of in dialogue with them and the larger opportunities of architecture and design. (2) Transform the current BED+MArch (4+2 years), in a single 5-year professional BArch, but, it will require a much strict admissions policy. Quality would increase greatly but not all current students could be admitted. Consolidating the two main current degrees into a BArch would liberate the master’s level to post-professional degrees (Masters of Science), that can offer the various levels of specialization mature students would want to pursue, in a more multidisciplinary way. In this scenario the BArch would be able to compete for better ranking with all the other national BArch programs. A 5 year program like the BArch also allows for a diverse education in the depth of the field and professional compliance. In either case, reducing architecture to pre-professional compliance will only limit our capacity to rank better. The best ranking schools in the nation treat “professional and academic accreditation” as their minimum offering, their extended values is what makes them the best. We treat the professional and academic accreditation as ceiling or goal, then try to “increase” value with (questionable) certifications. In either paths, we would need new faculty with larger vision. Our department is dominated by a senior faculty with over 50 years of teaching that, while their contributions have been significant over time, are delaying much needed change. 11. Currently, and like most of things, happening as an “administrative decision” not a faculty curriculum decision, the department head implemented a program: Integrated Path to Architecture Licensure (IPAL), that is created by the National Council of Architectural Registrations Boards (NCARB). The IPAL program is intended to bring “licensure exam” rubrics into the classroom in professional degrees to allow students to begin accrediting hours that would later would assist in fulfilling the lengthy process of architectural registration (7 exams, 2000 hours, 7-10 years average for passing exams). This IPAL program is now being implement not only in the Master of Architecture, which would make sense as professional degree, but in the BED. The BED students barely manage class contents, the IPAL program is another overkill that tries to produce numbers and compliance without content, demising the value of education to a transaction. The issue of why architectural education in the United States does not “literally” prepare students to the architecture registration exams is a larger issue. It has to do with NCARB’s obsolete model (before we needed to “know” everything now we can “look-up” and collaborate to fulfill safety, evolving building codes, materials, etc.), and the IPAL is a mostly misguided band-aid that is mistakenly applied here into a non-professional degree like the BED. 12. At the College level, the proposal of removing Viz and CoSci seems objective, and only affect the other departments in terms of finance and administration not in content. A college with Architecture, Landscape Architecture and Urban Planning is common. This arrangement offer the opportunity of a much interwoven education among all of them, and perhaps Urban Design, and follow models like that of Columbia University Graduate School of Architecture Planning and Preservation (GSAPP). Architecture has also been historically linked to Art departments, or a combination of Art and Planning, like Cornell University (one of the oldest programs) that has Architecture, Art and Planning (Cornell APP). Our proximity to the Polytechnic model, and the now pervasive STEM

framework, would suggest to incline architecture towards that end. Doing so would be a mistake. A renewed and forward looking College of Landscape Architecture, Architecture and Planning (CLAAP), would be inclusive of design and STEM education, linking the humanities and sciences traditions that architecture has been part of. STEAM is a productive emerging model. So are the Digital Humanities, but also the ever more needed inclusion of the Humanities in every sphere. 13. The University Studies in Architecture is a highly questionable program. Students are heavily lost in what that is for. The College level advisors (we don't have department level), are unaware of what our curriculum is, our class contents, or anything about what we do, and do an immense disservice assigning students to classes then don't know why they are in. We must distinguish the administrative advisor with a department level, content-specific advisor. 14. Architecture is much more than building. Architecture is much more than buildings technology. Architecture is not building science, Building Science in itself is a field. Certainly a field that can be included within architecture. Architecture schools nationally and some abroad are undergoing major curricula revisions, cluster hire of diverse faculty, reckoning with its centuries and decades old histories and products (including its problematic racial and social pasts), all in a rich and productive manner. Many schools radically responded to the Summer of 2020 events. We are not doing even the minimum. The kinds of change we are all in need of are not only administrative but educational, addressing contents as much as organizational logics, they sometimes overlap more than thought. 15. Although current collaboration among these two departments is meager now, it can be easily improved with new intersectional faculty and some of us who already operate in overlapping mode. 16. We have shared faculty, Art-Architecture Historians between VIZ and ARCH, we should be able to keep them in whatever arrangement develops, they are crucial, as younger faculty, to the needed change. 17. As a junior faculty who taught at various schools prior to join TAMU, the architecture department, or the college, were never really in the radar. Our Dean's extensive tenure have unfortunately not produce a reputable outcome beyond, as said above, the submission to industry and profession more than a dialogue with them and our own independent contribution as academic institution. Our department's unstable "head" figure over the years have not help either. Our [REDACTED], who was openly the current Dean's preference, is trying to "bring finances in order," comply with university assessment metrics, while negotiating a worn out faculty. Unfortunately he does not seem to have the vision of change beyond questionable assessment metrics. He takes advantage of student's effort to count as his achievements of diversity, for example, but objectively the department has not proposed nor made anything in that regard. He does not either, unfortunately, seem to have the empathy that these times require, yet he's supportive of all younger and junior faculty, but tries too much to satisfy the "old boys club." 18. Our College, as well as the Department, has a not only a significant "diversity" problem. But a problem of submission to figure of authority, of old models of power, and of constant homage to finance and questionable attitudes within a public university with a mission of the public good. The administration level of the college has barely the credentials to the positions they hold. Many have obtained them for years of service not qualifications or merit. [REDACTED]

19. The university and its research model—like most of life, has been subjected to the doctrine of neoliberal rationale manifest in the world of finance. The rubrics of finance have pervasively penetrated every sphere of life including education. Unfortunately many fields cannot be "measured" with the same "performance" metrics, neither all fields "produce data." Architecture is one of them, and this is an ongoing conversation in architecture schools and organizations like the Association of Collegiate Schools of Architecture nationally, that cannot be solved by imposing foreign rubrics to the field. It will continue to damage quality and the promise of improving rankings and registration. It is of outmost importance that the university resist operating as a reductive framework of financial performance. We must be strict and responsible in managing budget without any doubt, as a public institution in the benefit of the public good, but we must carefully avoid the limiting of the intellectual ethics pursuit of higher education. 20. Since the release of the report that these comments respond to, urgent meetings were called. The senior faculty, with 50+, 40+ years of teaching reacted with extreme defense against the recommendations. In one senior faculty extreme reaction "this is an attack on us, an attack of the likes of Pearl Harbor, the Third Reich, and the World Trade Center." Thankfully, I do not share this remark, but it serve to explain the current clashing worldview that is at play in the Department of Architecture. Change is indeed needed, but dialogue is even more.

- We are a research university. Our faculty were recruited over the last 20 years with the promise that Texas A&M is on a trajectory to be a strong, research based university. There is very little mention of research or national prominence in the report, and no mention of graduate students or research staff in the report.
- The report proposes a four-legged stool structure for the university. It is clear that Engineering, AgriLife, and Texas A&M Health had input into the report and the recommendations. In some cases, their strategic plans are literally quoted in the report. It is equally obvious

that no leadership or faculty in the proposed College of Arts & Sciences were consulted or had input into the report. If this college is to be part of the larger structure, it should have started with input into this report. • The report clearly does not include the voice of faculty at all. The proposed realignments of departments are based on stereotyped ideas about disciplines, with no apparent knowledge of the disciplines as they actually are or of the work being done in the units. The re-alignments of departments make no sense. We have faculty who are experts in their disciplines and have experienced multiple administrative structures, and it is egregious not to consult them early in this process. We also have faculty who are experts in organizations and organizational structure, and it makes no sense not to consult their expertise (such as that centralizing often has negative effects).

As a Faculty from the department of Biology, I will focus on the recommendation #5 as it directly involves the future of my career here at TAMU. This recommendation is, to me, a bad one on several aspects: (1) First, the department of Biology is among the best life sciences departments on campus on many levels (percentage/number of faculty with federal grants, number of papers in high-impact journals, faculty who have been prestigious awards like HHMI, Searle, Klingenstein, etc.). This can be easily verified by looking at the metrics. In most other departments, metrics are saved by only a handful of faculty... (2) If enacted, the recommendation would establish TAMU as the only University nation-wide (and likely world-wide) having a College of Arts and Science without a Department of Biology (or a Life science related department). I imagine that there are good reasons to why such a feat has not be accomplished yet by any other Universities yet. (3) There is clearly a lack of understanding of the current academic mission of our department of Biology. Setting up the curriculum, courses, classes, and teaching all biology courses with the current rigor is a gigantic endeavor. Transferring those responsibilities to people on campus who have no idea about what we currently do will almost surely damage the teaching of life sciences at TAMU in the years to come. To my view, this will have broad and dramatic consequences: (i) it will tarnish state-wide the reputation of TAMU life sciences, (ii) this will decrease the acceptance rate of our life sciences undergrads to professional school including medical/dental school, (iii) this will decrease the enrollment rate of undergraduate students willing to study life sciences. In fact, I would not be surprised also if some families sue TAMU in the next 3-4 years because their daughters/sons could not get to Medical School because of the poor teaching of biological sciences at TAMU due to the changes suggested in the MGT report. Altogether, this recommendation to dismantle the department of Biology seems to fit the personal agenda of a few people on campus having little (or purposely erroneous) knowledge of what we do, and how we do them well. If followed through, I not only foresee substantial decrease in the quality of teaching biology on campus (which can have devastating consequences on the enrollment of our future life science students), but also an exodus of talents and a tarnished reputation for TAMU biological sciences in the US.

Recommendation #5. Why would it be an institute and not a School or College of Life Sciences? it reads as if the name "institute" was chosen simply so as to not contradict the 4-legged stool argument in recommendation #1. Institutes exist to promote research and are housed under the VPRs office, and yet this one outlying Institute will have an academic mission and report to a Dean/vice provost? I agree that there is too much overlap among several of the Life Science units, in particular Biology and BIMS, Biology and Genetics, but also Biology and Ecology & Conservation. I can see many benefits to the proposed realignment if it Biology faculty can choose their ultimate affiliation. Biology's current strategic plan boasts intentions to focus on NIH-fundable cell & molecular . This is a good plan, but it explicitly devalues future participation from many existing faculty such as those studying Ecology and Evolution. Thus Biology already plans on recreating itself into a cell and molecular department while slowly shedding the non-NIH funded faculty. Why not just do it now and send Biology's ecology and evolutionary biologists to the Ecology and Conservation department or Entomology within COALS. Likewise the successful and popular EEB IDP, which isn't even mentioned in the Biology strategic plan, would obviously fit better in COALS. The rapidly expanding Neuroscience program creates several problems but also exciting opportunities. There is a new Neuroscience major and well-established NRSC graduate program. The interdisciplinary Neuroscience training programs involve faculty from Psychology, Biology, Chemistry, VIBS, NEX, and Engineering, and the proposed reorganizations will disrupt these training programs and may negatively impact the well-funded team research goals. Neuroscience is very well-supported by NIH, NSF & DoD, and its multidisciplinary nature benefits from synergy across programmatic units. If realignment is inevitable, I would recommend pooling NRSC faculty from across units to strengthen and enhance the existing NRSC program, perhaps codifying all of the distributed academic units into a department within either College of Science, COALS, or under the umbrella of Health. Neuroscience is ideally positioned to promote the NIH funding goals of TAMU. There is an opportunity here to do more than simply realign existing programs. A Molecular and Cellular Biology department housing only NIH investigators would be very successful and highly ranked, and a separate Neuroscience department

that emphasized NIH & DoD funding could be designed to dovetail well with the Engineering-Medicine plan and HSC emphasis on military research.

---

Bottom line up front: If the recommendation to move COSC to the College of Engineering is accepted by Texas A&M leadership, my strong recommendation is to leave the COSC program alone and let the move to the College of Engineering be 100% administrative in nature - with the only change being the word "Engineering" replacing the word "Architecture" on paperwork and websites. As a faculty member in the Department of Construction Science (COSC), I appreciate the statement in the report that we are "nationally recognized as a top program by the construction industry". It is important to understand that the fuel of this success is the DEMAND OF THE INDUSTRY for what COSC produces. I believe that there are 4 factors built around this demand that contribute to this success. I also believe that the more that these factors are messed with, the more we risk lowering the national prominence of our COSC program. In short, if it ain't broke, don't fix it. I do recognize that COSC has areas that could improve. However, those improvements should be made carefully without negatively impacting the 4 factors listed below. The 4 factors are: 1. Construction Industry Advisory Council (CIAC) 2. Curriculum 3. Faculty 4. Student

1. CIAC. The CIAC is a group of about 150-200 construction companies that provide funding/donations to COSC and council about industry demands. I'm only guessing, but their total donations per year is about \$500K. These companies hire the lion's share of our students because they know what kind of students they're getting from the program. They represent the demand that the industry has for COSC students. THIS DEMAND FOR COSC STUDENTS IS THE FUEL OF OUR COSC PROGRAM'S SUCCESS! How do you destroy this demand and run the CIAC off? You destroy the factors below.
2. Curriculum. The current degree plan was put together by the faculty with advice from the CIAC. Because the CIAC has been able to provide input, they have an increased level of confidence that our students have the skills they want to see when they interview and hire our students. How do you destroy this? You require that current COSC classes be sacrificed to make room for Engineering classes. Entry level Engineering classes that are not relevant to construction would weaken the curriculum of the COSC program. This would weaken the caliber of student we train and decrease the industry's demand for them.
3. Faculty. The current faculty is a mix of academics and industry professionals. I will admit my bias here: I believe the industry professional faculty members at least help to distinguish the COSC program. Our industry experience enables us to provide instruction that is directly applicable to the industry and also increases our students' effectiveness in their jobs. How do you destroy good faculty? Get rid of them and stop letting them use their industry experience to prepare students for the real-world construction problems of today. This would weaken the quality of COSC students and decrease the industry's demand for them.
4. Students. The ultimate goal of COSC is to prepare students in a way that is desirable to the industry so that they can get hired and go to work. That's why each of the factors above concludes with a possible effect on the students. The type of student that graduates from the COSC is the product of COSC faculty and industry working together to ensure that students leave with applicable knowledge and professionalism that depends on the 3 other factors above. The COSC program is tailored to meet the demands of the industry. This is evidenced by COSC students' outstanding rate of hire by the industry. How do you destroy the quality of the student that graduates from the COSC program? You destroy a good curriculum and you get rid of good faculty. This would result in destroying the quality of the student. And destroying the quality of the COSC student will destroy the demand that industry and the CIAC has for them.

In conclusion, I have tried to boil down the success of the COSC program to 4 distinct factors. Though distinct, they are related - messing with one will affect the others. And because the COSC program is already successful, I believe that moving it from the College of Architecture to the College of Engineering could work if the above factors are left alone. To be clear, I am not saying that the COSC program is perfect. There are definitely ways it could be improved. However, I strongly recommend AGAINST moving a nationally prominent program from one college to another AND imposing additional changes on it that would risk sacrificing its national prominence in the process. Thank you very much for reading this. Respectfully, Jonathan Houston, PE, LEED AP BD+C

---

I will comment on the School of Visual and Performance Arts with the strong participation of the Visualization department. I am one of the first faculty in the Visualization program. I am both a computer graphics researcher and a professional cartoonist. I have taught both computer science and art courses for more than 25 years. There is a need for some clarification. Computer Graphics from the beginning was an area that combines visual art, mathematics, and sciences. Companies such as Pixar, ILM, or Dreamworks are essentially multidisciplinary in arts and sciences. The success of the original Visualization program comes from this need for multidisciplinary people in arts and sciences. I agree with the report that multidisciplinary education in art and sciences will be very important for the future based on our experience. On the other hand, I see a significant problem putting two types of people in the same school in terms of hiring and tenure as the longest-serving and current chair of the Visualization department P&T committee and as a

person who served many searches as chair and member for the department. In terms of hiring, the problem is average salaries of computer scientists are much higher than artists. It becomes easier to hire artists, however, it becomes harder to hire engineers and scientists. The salary discrepancy becomes an internal problem. Before the department started the ratio of computer scientists to artists in the visualization MS program was 60%. After 12 years it dropped to less than 10%. We are now trying to go back at least 20%. Promotion and tenure is also an issue. Two different types of expectations make the process harder. My solution to these problems is to split the department into two and move them to two different colleges. The department really has two types of programs. The current BS and MS programs have CIP code 11.08 computer graphics. University lists these two programs along with Computer Science programs under CIP code - 11, which is computer and information services. CS programs are 11.07. The new PhD proposal has also the same CIP code 11.08. On the other hand, our MFA program has CIP code 50.07. It is listed under visual and performing arts along with performance studies. A win-win solution, to move the MFA program under the school of performing and visual arts and create a BFA degree. In addition, we can move BS and MS programs under engineering. The newly proposed Ph.D. degree can also go to engineering. These two halves can collaborate exactly like many other schools such as Ohio State. The advantage is that both can grow strongly instead of dealing with unnecessary internal struggles.

---

Recommendation #1 (Combine Colleges of LA, SCI, and GEOSCI): Faculty in these Colleges were indifferent when unpleasant changes were occurring in other colleges, so I guess I feel indifferent in response. Let them combine. Faculty will either get over it or leave. Recommendation #2 (Establishment of a School of Visualization and Performing Arts): this is the best idea from the entire report and I am highly supportive of this move. My only concern is the cost of this move. Recommendation #3 (Establishment of a Department of Journalism): Didn't TAMU eliminate this department a decade ago? Was it a mistake then? How will this be different from the Department of Communication? Was the consulting group even aware of the Dept of Communication? Wouldn't it be more cost-effective to rebrand and retool the Dept of Communication? Recommendation #4 (Expand the role of the Bush School): makes sense to me. Recommendation #5 (Create the Institute of Biological Sciences): Seems like a win for AgriLife but a potential loss for the Dept of Biology. I think it could help new UG students find a biology based major faster and one that suits them. So I think this is a good move. Recommendation #7 & 8 (TAMU Health Administrative Organization/Research): I support both Recommendation #9a (Reassign University Studies to College of LA and SCI): First there would have to be a College of LA and SCI. I think this degree program needs to be eliminated altogether. Recommendation #9b (Vet School- Small Animal Hospital): another example of the consulting group not performing due diligence. The problem with the Vet School is the lack of diversity among students. I could be wrong by a few percentage points, but it appears that 90% of students are white females who want to work with small animals in urban and suburban areas. Rural Texas is not being well-served by the Vet School and this is why Texas Tech made the play to open up a 3rd rate vet school. The focus needs to be on training a wider diversity of students who are willing to work with large animals and live in small towns in Texas. I know the current model is financially lucrative to TAMU because of the tuition it collects from its current student demographics, but it's not going to be supported long-term by the Texas livestock industry and horse fanatics. TAMU is losing political goodwill among the rank and file in rural Texas because we are not training enough large animal vets. Recommendation #9c (Refocus the College of Architecture): I am supportive of this move. They have become too dependent on the Viz Lab Recommendation #9d (Consolidate the Department of Health): I am supportive of this move

---

Proposals #1,2,4,6, and 8 would gain my support. These should be more highly prioritized

---

I find the majority of these proposed changes well justified. As a biologist, I was particularly interested in the proposed changes to how the biological sciences would be organized. I think the idea has merit, but the planned organization is not well thought out. If anything I think this plan does not go far enough to rectify the confusing array of biological scientists scattered all over the place. I think something more radical, albeit initially painful (logistically), would be my own preference. Our biosciences expertise at TAMU is an enormous asset and all the talent is being squandered because we are increasingly tasked with pencil-pushing jobs, and needless musical chairs cooked up by deans. Generally speaking the College of Ag and the Vet School has the highest concentration of life science researchers who bring in USDA, NIH, NSF, DoD funds. There must be a better plan to bring these people under a single umbrella. Moving the department of biology into a new institute is a half-measure that will only make it more disorganized and confusing. My personal solution would be to abolish all the departments, especially in Ag. All research is interdisciplinary nowadays (esp. in biosciences) and the idea of departments are outmoded. Departments also cause unnecessary administrative

structures and endless petty politics and sycophancy to the powers that be (gag!!). Research labs should be organized into clusters (eg. systems biology or applied animal systems or cellular and molecular sciences etc). The clusters should have mandatory rotating chairs with 2-year terms, and chairships will be given to internal candidates only with a moderate administrative stipend. With this structure, people will be free to collaborate with anyone they wish to. Clusters should not be competing for resources and have to plead for positions or resources. Cluster memberships are driven by faculty expertise. If a cluster has diminishing membership, then it clearly doesn't need to exist anymore and. Each cluster will have a progress and recruitment plan to grow its ranks on a regular basis. Cluster faculty can teach courses across clusters in existing or new program SIP codes. Cluster faculty maintain program viability through their research productivity and creativity and not be at the mercy of departmental politics and ill-conceived ideas of rotating deans and vice-chancellors.

---

In principle, merger of the College of Liberal Arts, Sciences, and Geosciences has certain advantages. I am particularly happy to see creation of new departments in performing arts and journalism, provided that these new departments will be adequately funded without taking the much needed resources away from the existing departments. However, I have one major concern about this part of the report. It is suggested that Department of Biology should be moved to AgriLife. Biology is a science and it definitely belongs to the College of Arts and Sciences. In fact, I also believe that biophysics and biochemistry should be part of the college of science. There is a significant and growing synergy between math/statistics/chemistry/physics and biology (there are numerous examples of that!). I believe that neither biology nor other science departments are well served by this proposed change. This is probably the most problematic part of the MGT report (together with the centralized advising recommendation).

---

Creating a college of Arts and Sciences is long overdue. It is effective in many universities that are ranked higher than TAMU. However, the report has many factual errors regarding the justification for academic realignment. For example, with the exception of one (Cornell) all top-ranked universities have Biology in a college of Science or Arts and Science. Redundancies in instruction occur only at the UG upper levels and these could easily be eliminated via transfer to Department of Biology, which has the physical capacity to handle the demand and a proven track record in academic success, especially for underrepresented students. Keeping Biology in the new College of Arts and Sciences maintains the upward trajectory of this department, which is on pace to achieve a top 20 ranking. Moving Biology and BIMS to College of Ag may temporarily offset financial problems in that college, but gains from SCHs are likely to be lost within a few years, and would negatively impact the merged college of Arts and Science. Even the arithmetic for projected numbers of students in these colleges is incorrect.

---

I am a junior member of the Political Science faculty. I thought the realignment suggestions (in particular: moving core departments out of Arts and Sciences) were unconventional - and pretty clearly out of step with what our aspirational (and actual) peer institutions do. I didn't find the rationale offered convincing - certainly there is some overlap between the Bush School and the Political Science Department, but there is \*more\* overlap between Math and Physics, or between Physics and Engineering. And I am not sure that implementing these suggestions will increase the prestige or quality of the University or the departments/schools affected. I think it could be fine - it just depends on how it is managed - but the report did not offer any guidance on that issue. That said, I do not have strong feelings about where the Political Science department is located. I am happy to be located in the Bush School or anywhere else. I care primarily about being in a department that aligns with my academic preferences. These preferences are as follows. First, I would like to be able to pursue my research. Giving faculty enough time to research is in my opinion critical to keeping good people in a department and maintaining a good department ranking, which in turn are very important things for attracting students. Second, I would like to be able to teach useful, sensible, interesting classes to hardworking students. Finally - and this is related to the first 2 points above - I feel pretty strongly that scholars should never be activists, especially not in the classroom. I think the job of a serious scholar is to pursue and impart knowledge, as rigorously, impartially, and honestly as possible, using the best methods at their disposal. My personal view is that quantitative/mathematical methods of analysis are invaluable in the pursuit of knowledge and in developing critical thinking, and are critical skills to teach to students at all levels. These skills will assist students both in being good citizens and in finding good jobs. I am, of course, biased, since I primarily teach classes in quantitative/mathematical analysis and I use these methods in my research. So to sum up, I want to be in a department that encourages faculty to engage in high level research, and prioritizes the teaching of (quantitative and game theoretic) methods and critical thinking to students. Our current Head, Bill Clark, shares these preferences (in fact, a big reason for my joining TAMU was that Bill was the department head and I really liked his vision for the department). If a move to the Bush School will help us in Political Science to structure our department along these lines, attract job candidates who are conducting cutting edge

research, and allow me to pursue my own research and teach methodologically challenging classes, then I am all for it.

We appreciate your attempts to realign the university in a more efficient manner. Due to some of the recommendations presented, we do, however, urge you to revisit the recommendations presented regarding the College of Architecture in some manner. Below, I outline some points in this regard from the lens of the Department of Landscape Architecture and Urban Planning within the College of Architecture. Success in Landscape Architecture and Urban Planning: The recommendation's state that "by refocusing on core mission, there is an opportunity for university investment and positioning the College of Architecture to become the best in the nation with unmatched impact.....to do so will require investments in new faculty and in innovative education and research facility by the university administration. This change should enable the College of Architecture to achieve higher stature and recognition." We appreciate the notion of becoming a leader at the college level and we are excited about this opportunity. I would like to also notify you that, within LAUP, we are already currently a leader in our respective programs. For instance, the landscape architecture program has long been the flagship program of the College of Architecture. For example, in Landscape Architecture, we:

- Consistently rank in the Top 10 (BLA) and Top 15 (MLA) of all Landscape Architecture Programs in the nation in Design Intelligence (the most respected ranking system in Architecture and design-based programs) over the last 15 years.
- Rank #10 in 2021 Best Colleges with Landscape Architecture Degrees in America from niche.com
- Rank #4 in 2021 Highest Paid Landscape Architecture Graduates from collegefactual.com
- Rank #7 2021 Top Landscape Architecture Bachelor's Degree Programs from collegetraptor.com
- Rank #12 Best Landscape Design Schools in the World from worldscholarshipforum.com

Relatedly, our Planning Programs:

- Rank #2 in 2021 Affordable Urban Planning Degrees from College affordability guide: collegeaffordabilityguide.org
- Rank #2 in 2021 Master's in Urban Community and Regional Planning Programs in Texas from niche.com
- Rank #10 2021 Best 15 Master's in Urban Planning in 2021 from Best Value Schools: bestvalueschools.org
- Rank #10 in 2021 Top City/Urban, Community and Regional Planning Bachelor's degree Programs from collegetraptor.com

LAUP faculty are unsurpassed by our peer institutions regarding research, funding, publications, and citations in the fields. Our Landscape Architecture program also has more licensed landscape architects in the State of Texas than any other program (Texas Tech, UT Austin, and UT Arlington also all have programs). I think it important to highlight these things in that, while it is named the "College of Architecture", the focus should be much broader. The College is multiple departments and multiple programs. There is much potential to build off of this broad legacy, rather than disassemble it. We have a world class department in LAUP, and I only hope that the recommendations would build more so from our strengths. We are also the strongest College when it comes to community engagement and outreach as we include it in nearly every pedagogical project in each semester. We work closely with Texas Target Communities (well respected in your recommendations but we do not want to lose this lineage as LAUP created this organization) and our Partnership for Community outreach to conduct real projects with communities linking students, faculty, and citizen science. Addressing the Recommendations of the removal of two Departments from the College of Architecture: Recommendation #2 states to "establish a School of Visual and Performing Arts with new departments in music, performing arts, and fine arts, and relocate the Department of Visualization to anchor this new school." Within this School, there is to be a Department of Art and Design. As part of this Recommendation, as stated in Recommendation #9c, to refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning, it is suggested to "move the Department of Construction Science to the College of Engineering to enhance the educational experience and research potential for faculty and students in both organizations." We wholeheartedly wish you to reconsider these recommendations. VIZ is honestly more computer science and art, not really fine arts. How can it anchor such a new school when it is ½ not that. The basis of these recommendations is also a bit muddy. Decisions should be evidence based, but if they are based on wrong data, then the decisions will be wrong. Response rates show students at 2%, former students 4%, and faculty/staff only 10%. Further, the SWOT results don't appear to fully match the recommendations. Research on university changes like this show that top down is not always best. Emphasis on efficiency over effectiveness and quality can sometimes have dire outcomes. The College of Architecture has worked hard to build interdisciplinary and diversity; the consulting company seems to now see this as a negative to be fixed. As both the VIZ and COSI department were given birth, grew from, and now flourish with in the College of Architecture, we find this idea to be extremely disadvantageous. This will separate generally aligned disciplines that already currently work together, remove two 2 legacy departments within the College, and leave two noteworthy departments as a small outpost College. We actually now recruit based on being the largest College of Architecture in the nation. Many per institutions have similar structures as ours and are nationally viable regarding research and teaching. Students working with others in their related disciplines currently Faculty and student

collaborations will also be weakened. Adjusting the Recommendations: Visualization, Architecture, Construction Science, Landscape Architecture, and Urban Planning all fall along a continuum on which Art rests on one side and Science the other. This is why we work together so well currently and have created such strongly aligned departments like Visualization. In my experience, when you become such a small college, you diminish your impact, not strengthen it. Also, with only two Departments, you may create a system of “us vs. them” between ARCH and LAUP. The College of Architecture has been trying to change its name for years now. This could be a perfect time to do so while adding to the existing College of Architecture structure, not limiting it. Most built environment related colleges nationally have already done so to highlight Sustainability, STEM/STEAM, and other innovative initiatives. Perhaps this is a good opportunity to (while hopefully still leaving VIZ and COSI), grow the College of Architecture, with a new name change related to the Natural, Built, and Virtual Environments, and possibly also adding new related departments such as Geosciences, Recreation, Parks and Tourism Sciences, and other similar academic units. Further, this could be a good opportunity to also expand degree program options related to the built environment such as interior design, graphic design, historic preservation, urban design, etc. Finally, such changes lead to many unknowns which are not yet answered. For example, centralization of the advisors could hurt our recruitment. While we have some of the largest Landscape Architecture and Urban Planning programs in the nation, we run the risk of decreasing or enrollment, as our advisors act as mini recruiters currently. Also, we are research heavy due to the successful research centers, endowments, and professorships in place currently. What happens to these if the College is broken up? Our donors and Advisory Boards are also not happy with said recommendations, will there be Alumni backlash? Because we are such strong researchers, the centralization of business office related duties will extremely burden grant writers. How will this increase productivity and efficacy? I truly believe we all want what is best for TAMU and we sincerely appreciate your efforts to try and make the university and the College of Architecture top-notch. I hope that we can all work together to continue to do so. Thank you for your time and for listening to my thoughts and ideas.

---

As a faculty member in the College of Science, I am very concerned about being in a larger college with quite different academic disciplines for many reasons. I will just name a few: 1. We have strong departments in my college currently, some highly ranked and others on a trajectory to higher ranking and actively working to improve. We could lose out if resources are directed away from the sciences. The best faculty would leave. 2. Having a dean of the college who understands scientific research and all that entails for recruiting, hiring, promotion, etc., is crucial for our departments. 3. The vision of a larger college being a stronger unit within the university is compelling, but I worry that we will be seen as a college of service teaching rather than for our own strength in research and scholarship. A top university needs top science departments. I sincerely hope that if this realignment is carried out, all of these potential problems and others can be solved, as otherwise the best science faculty will leave. I am also extremely concerned about the proposal to remove the biology department from a college that includes other basic science departments. I am not a biologist, but I know of the work to improve their department that is well under way and will continue under the leadership of the new department head and of a dean who understands science. Biology is one of the basic sciences, and belongs in a college with the others.

---

Consolidation of Liberal Arts and Sciences There are parts of this plan I find interesting, perhaps even promising. Nevertheless, MGT is naive about the dynamics of humanities and sciences and justifies its proposal to unite the two with faulty reasoning. For instance, the report emphasizes that a combined College of Liberal Arts and Sciences would be one of the largest colleges on campus. First, why is that seen as an inherent good? Bigger is not automatically better. If it were better, then why not just combine even more colleges? Wouldn't that be better still? Of course not. It's a specious argument. It's also disingenuous given that many of the degrees and students it counts in the combined college structure are, elsewhere in the report, going to disappear as the Department of Biology is moved to AgriLife. Second, the report asserts that placing the humanities in the same college as the sciences will elevate the status and resources of the humanities. This is a bold assertion without an ounce of evidence that will actually be the case aside from some cherry-picked examples of the arrangement working at other institutions. STEAM is an attractive idea, but given the historical animosity between the humanities and the sciences, there's every reason to doubt that liberal arts will have more leverage once subsumed into a STEM college than they have on their own. Third, the report goes into depth about the advantages to (some) humanities majors of being in a STEM system. For instance, it talks about theater students learning construction techniques and fine arts students learning design technologies and studio tools. Again, this is an egregiously specious argument, not least because none of the departments proposed to fall under the new college actually have any expertise in either of those domains. Expertise in building is concentrated in engineering, while much of the expertise in design technologies fall under architecture. Finally, I have grave concerns about tenure and

promotion in the proposed, combined college. Faculty in the sciences and the humanities have very different professional expectations, duties, measures of success, etc. The tenure and promotion process is fraught as it is without throwing disciplinary misunderstandings into the mix. Journalism Program I agree with the report's recommendation that Texas A&M could benefit from having a strong journalism program. Nevertheless, I find it ironic that we need to be advocating for a department that the university very carefully and deliberately dismantled over a decade ago. We would not be in this position, now, if other administrations hadn't gutted a successful program then. At the same time, I find it strange to justify the need for a strong journalism program on the grounds that "students and the public gain a comprehensive understanding of journalistic terms, processes, and transparency practices." It sounds good, but it's meaningless given that relatively few students are likely to actually take any journalism classes.

Institute of Biological Sciences The call for the biomedical sciences program to be combined with the department of biology under AgriLife is, perhaps, the most ludicrous part of the whole report. However, it neatly demonstrates the folly of prioritizing administrative efficiency above everything else. Let's begin by questioning why the life sciences are being singled out for this singular "honor." Throwing biology and biomedical sciences together on the basis that they are both life sciences makes about as much sense as combining psychology and political science on the basis that they both use statistics. Yes, there is nominal overlap in some of the courses that biology and biomedical sciences majors take. However, the same can be said of biochemistry majors and chemical engineers, yet no one would seriously suggest that would be an academic pairing that makes sense. One of the things that makes the biomedical sciences program so strong is that foundational courses within the major are taught by professors with clinical backgrounds. Sure, a biology professor teaching anatomy and physiology is covering much of the same material as a professor teaching those courses in CVMBS. However, they are approaching the subject from fundamentally different angles. BIMS students need a clinical perspective because that's their career trajectory. Placing them under biology professors will seriously undermine their success. Of course, combining BIMS and biology creates huge inefficiencies that will not be offset by bureaucratic savings. Currently, many of the professors teaching courses in the vet school are the same professors teaching BIMS majors. Removing BIMS from CVMBS, then, will require hiring new faculty and creating new facilities to teach what students are already being taught in spaces that were created specifically with them in mind. This makes no sense whatsoever. At the same time, the report rather callously declares that the Department of Biology is underperforming. Setting aside, for a moment, the problem that asserting this based on gossip without providing any metrics to back it up is completely unprofessional and vindictive, if it were true that the Department of Biology is underperforming, how in the world will placing even more teaching burdens on biology faculty, making them responsible for BIMS courses, going to help? The short answer is that it's not. What is being proposed, then, is to duplicate faculty and to create new, duplicate facilities in order to give undergraduate BIMS majors a poorer experience at great expense. There is simply no way that is offset by lower administrative costs. The other rationales for this juggling act are even more preposterous. For instance, the report states that "having heterogenous faculty split between colleges makes it difficult to create equal metrics for comparison." However, that's the nature of academia. Universities are split into colleges. Faculty are, of necessity, heterogenous. Comparisons between them are always difficult. Absolutely nothing about this proposal changes those fundamental facts. Yes, more life science faculty will fall under the same college, but the university is still left with the problem of creating metrics to compare faculty across colleges, disciplines, department, etc. The report also goes to great pains to justify shuffling biology-related programs around the university on the basis of making it easier for undergraduates to change majors. However, it only makes it easier for students who decide to change from one life science major to another. That presumes that most students who change majors stick to life sciences. I see absolutely no numbers to justify that assumption. Having all undergraduate life science majors housed within AgriLife doesn't make it easier for students to change from, say, microbiology to psychology or from biochemistry to biomedical engineering. At the end of the day, the distinctions here are utterly arbitrary and ill-conceived. I would also question the report's assertion that a major stumbling block for collaborative research on campus is because of competition between faculty for resources. Most research funding comes from outside sources. Faculty aren't competing with other faculty at Texas A&M so much as they're competing with researchers from across the country or even across the globe. Furthermore, the report states, rather oddly, that "There is...duplication of current faculty members areas of interest, which hinders the ability of faculty members to collaborate and contribute to advancing research and student success." This is nonsensical. At the heart of any collaboration is overlap in interest between scholars. If anything, then, this situation facilitates rather than hinders the ability of faculty to collaborate, thus increasing their ability to meaningfully contribute to advancing their fields. Finally, the report rather confusingly suggests that another rationale for moving BIMS to AgriLife will allow CVMBS to turn its attention to building a new small animal clinic. However, CVMBS has been

hankering to update its small animal facilities for a long time, now, and not once has anyone in the college argued that they'd be able to do so only if they didn't have undergraduates to teach. The two have absolutely nothing to do with one another. Similarly, the report then goes on to suggest that AgriLife has a wealth of expertise relevant to small animal research. That's undoubtedly true, but why mention it unless there's some movement underway to combine CVMBS with AgriLife? Again, the combinations being proposed show that MGT really has no understanding of what it was analyzing.

As a member of the health faculty in the Department of Health & Kinesiology, I, along with my colleagues, oppose the movement of our health education division to the School of Public Health on the grounds that (1) it is not in the best interests of our faculty nor our students, (2) it detracts from our ability to attract new students, and (3) the information that supposedly justifies the proposal is inaccurate. Report Recommends: [Recommendation #9d]: "Consolidate the Department of Health and Kinesiology in the School of Public Health, including clinical research associated with the Department of Health. (...) Refocus the College of Education and Human Development on the core mission of producing educators and move the Department of Health and Kinesiology ... to appropriate units" (p. 38). The majority of faculty within the Division of Health Education in the HLKN Department believes this recommendation is ill-suited, given that the Division of Health Education contributes significantly to the College's focus on "producing educators". The Division of Health develops/trains Health Educators with degree options that allow for TEA teacher certification and enable students to sit for the nationally accredited Certified Health Education Specialists. Undergraduate degree options are: BS in Health Education (with an emphasis on Allied Health) or a BS in Community Health. All graduate degrees are in Health Education (and not Community Health). Health Educators and Community Health/Public Health Workers are specifically identified by the U.S. Bureau of Labor Statistics (BLS) as distinct occupations. Each training program has its own, unique certifying agencies. For health education programs: the National Commission for Health Education Credentialing, Inc. (NCHEC); for public health programs: the Council on Education for Public Health (CEPH). Re-alignment of the HLKN department with the SPH would contribute to REDUCING THE FOCUS of the College of Education and Human Development on its "core mission of producing educators", by eliminating one of its vital education-oriented programs. Moreover, even if a move to SPH is imminent, resources still need to be invested to articulate differences and ways to capitalize on the strengths in the BS in Health and Community Health degrees and avoid the duplication created by SPH's BSPH. The BS in Health and Community Health need to be intentionally maintained and keep a focus on health education and promotion with responsibilities and competencies, different from what one would find in BSPH preparing professionals for Epidemiology, Health Policy, and Environment and Occupational Health. Report claims: "Program growth in each academic unit, specifically in the Community Health and Public Health degree programs, often appears to continue to create new conflict, course offerings, and program expansions in the other (...) however, this duplication of program offerings is an inefficient use of resources, confusing for accreditation and program evaluation" (p. 39). While the report suggests HLKN and SPH experience duplications that might be confusing for accreditation and program evaluation, it fails to acknowledge the origins of the perceived overlap: The BS in Health Education began with the establishment of the College of Education in 1969. The SPH's BSPH was established in 2014, proposing to duplicate courses that aligned with the Division of Health's already-established professional preparation programs and degrees (which prepare school health teachers, community health educators and the health workforce). If there is competing demand for students at the undergraduate (or graduate) level, it would seem wiser to capitalize on existing pedagogical resources already in place in the Health Education program (in HLKN). It would also seem wiser -- in lieu of moving HLKN to the SPH -- to capitalize on the forces driving enrollment in the Health Education undergraduate and graduate programs at a rate two-thirds higher than that observed in the SPH. Report claims (erroneously): "The overlapping degrees are the Bachelor of Science in Public Health, Master of Public Health, and Doctor of Public Health within HPCHS, and the Bachelor of Science, Master of Science, and Doctor of Philosophy in Community Health at HLKN" (p. 38). The health-related Master's degrees offered in HLKN are MS in Health Education; the one offered at the SPH is a Master of Public Health degree. HLKN offers a Ph.D. in Health Education (not Community Health as claimed in the report). SPH offers a DrPH. Assuming these degrees are redundant reveals ignorance regarding the nature and function of these titles: both the MPH and the DrPH are practitioner-oriented degrees -- appropriate for professionals working in state or federal-level departments of health and/or health care providers focused on practical applications of public health principles. MS and Ph.D. degrees are research and scholarship-oriented degrees -- appropriate for professionals seeking to research, develop, and disseminate new knowledge, as well as for scholars critically assessing knowledge development and ethical implications of applying research-based innovations/knowledge. Report claims: "One of the primary reasons to move HLKN to SPH is that SPH's Council on Education for Public Health accreditation will not allow

SPH to eliminate degree programs or to offer joint programs” (p. 39). A recommendation to dismantle one of TAMU’s largest academic departments because an accreditation program does not permit another solution is ludicrous, at best, and disingenuous at worst. The rationale appears invalid, given that several other peer institutions have CEPH accreditation for their Public Health programs while simultaneously housing other units similar to HLKN’s Division of Health Education. One such peer institution - which the report failed to list in Appendix 3 -- is The University of Texas at Austin. UT-Austin houses both undergraduate and graduate degrees in Health Behavior and Health Education in their Department of Kinesiology and Health Education -- within the College of Education -- while also offering a BS in Public Health; at the same time, the UT School of Public Health offers MPH, DrPH, and PhD degrees (alongside non-degree certificates and programs). Other peer institutions having the same model as TAMU (Health Education programs outside SPHs), with concomitant Schools of Public Health and their degrees include: the University of Alabama Birmingham and University of Florida. Counter-Recommendation: Move the smaller unit of HPCHS at SPH into the HLKN Department. From both a budgetary and efficiency perspective, it is more feasible to move the smaller HPCHS from the SPH into the HLKN Department, given the Health Education Division’s history, scholarly productivity, national prominence and leadership role within the HLKN Department, the College of Education and Human Development, the University, and nation-wide. Moving the HPCHS department into HLKN would cost less and would allow the HLKN’s Division of Health Education to maintain its independence and leadership role within the profession of Health Education, thus contributing to the College of Education’s focus on developing professional educators of various stripes.

Here’s a finding from the report: “More than half of peer institutions house their schools of liberal arts and sciences in a combined college.” Based on this finding, the report suggest that TAMU should house its liberal arts and sciences in one college. I think before making that recommendation, one should also investigate how the liberal arts and sciences do in one college – are they thriving more when together or when separate? This is completely not addressed. Just the mere fact that they are together in some universities is not enough information to make such a big change. Out of the mergers under the proposed College of Liberal Arts and Sciences, the most problematic seems to be the merger of the Libraries under this college. It is my understanding that the libraries serve everyone on campus, and thus, limiting the libraries to one college would put the library in a very awkward situation where the funding and loyalty based on the structure is for the College of Liberal Arts and Sciences, but they need to serve everyone. I think strongly that the libraries should remain as a separate entity, separate from any specific college.

The basic idea of a university with 4 equally balanced pillars is very good. The imbalance between the huge Colleges of Engineering and Ag and everyone else has been holding the university back. Having a layer of leadership between what are now deans and senior leadership will create opportunities for strategic alignment and collaboration. Having said that, some of the detailed recommendations are unlikely to work and trying to force them will make the big-picture less likely to succeed. It seems silly to get bogged down in discussions about, e.g., the Bush School and Political Science, ignoring the big-picture recommendations that are potential game-changers.

I understand that combining many current colleges into one larger and broader College of Arts and Science is controversial, but on the whole, I believe that combining all sciences into one college is beneficial and I don’t reject, out of hand, the notion of combining, arts, humanities, and sciences together in one large college. However, I believe that this must be done with care to offer advantages over the current structure. The reason I emphasize the need for a careful approach stems from the embarrassing lack of care and precision in portions of the report. It would have been helpful for the authors of this report to be sure that they use/report accurate numbers. I am not sure what to make of numbers I read in the report that I am not familiar with when I see numerical values of, for example, number of departments in a college that I know to be incorrect. From my own experience as an undergraduate at UCLA, a large state school with a good ranking and College of Letters and Arts, I more or less thought of UCLA as being equivalent to the College of Letters and Arts. From my perspective there was no difference. The university/college was large and many faceted and most of my educational experience was defined by the department where I majored. The one thing that I enjoyed about the broad College was my opportunity to take broadening courses that were far more free and open than we currently offer students at TAMU. That is, as a physical science major, I was required to take (and enjoyed taking) a year (2 semester courses) in each of the other areas of the College - biological sciences, social sciences, and humanities. ALL courses within the College were counted as broadening courses in one of the four areas of the College, not just some designated introductory broadening courses. Thus, I was able to take an advanced German 5 course reading original literature in the original language or great writers, rather than a low-level introductory course in humanities, and I enjoyed taking a business law class as a broadening course, a course that has been useful throughout my life. After all, once the faculty of the university have approved a course as part of the curriculum, why add

complexity and dumb criteria of what a broadening course must accomplish? Clearly, a challenge of a large broad college is prioritizing faculty hiring in different more specialized programs, and evaluating faculty for tenure and promotion, requiring faculty and administrators to define what constitutes excellence in diverse fields. This ultimately has to be done for the university at some level, whether it's within the college or outside the boundaries of the college. I can only say that I feel that I could offer appropriate assessments of careers in the sciences, but I'd have much to learn to assess excellence and professional achievement in the liberal arts, performance arts, and visual arts. There are two specific recommendations of academic realignment of this report that I would like to comment on. The first I strongly favor, and the second is highly problematic. I am delighted to learn of the change in course recommended in the arts and journalism. Performance arts at TAMU will benefit greatly from adding real performance to the study of performance. Our current model makes the false assumption that writing papers, analyzing the arts is especially difficult, worthy, and good for the careers of our students, when performance itself, as taught in conservatories is unworthy of a university education. I endorse this proposal as presented, and believe that STEM fields and the entire university experience will benefit by converting to STEAM. I am not in favor of deleting Biology from any College of Arts and Science. I agree with the authors of the report that TAMU's current situation with life science faculty and students split across many colleges and programs requires redress. However, I believe this could be solved with more innovative approaches than simply to redraw silos of the university. Interdisciplinary institutes and centers that focus on life sciences and agricultural applications come to mind as potential solutions. The problem with moving all biology to the College of Agriculture neglects the important connections between biology, and other sciences, including physics, chemistry, geology - ie. biophysics, biochemistry, geobiology. To be sure, my own specialty will not be hurt by this change. It is simply unimaginable to me that biology will thrive at Texas A&M by initiating barriers and cutting off interdisciplinary studies and educational programs.

If the Colleges of Liberal Arts and Sciences are combined, please ensure that the humanities are not lost. Current promotion processes for non-tenure track faculty vary drastically across these two existing colleges. I fear that we in the humanities will be further devalued if combined because we do not bring in the same sort of external research dollars (even though we teach the majority of undergraduate classes). For additional consideration, programmatic assessment will be difficult. I currently serve as the Faculty Fellow for Academic Assessment in my college. I'm good at my job because I have served at the national level for my discipline as an accreditation program reviewer. If the two colleges are combined, this role will need to either be a full time position for one person OR maintain separate fellows for the disparate departments. The scientific method is not applicable when conducting assessments in the liberal arts and humanities. The suggestion of establishing a new VPA school is one that doesn't seem to take into consideration the THECB guidelines and restrictions. Many of the programs suggested in the report would be nearly impossible to develop given our proximity to UT Austin and UHouston, schools with well established visual arts, music and performing arts, fine arts, and journalism. Furthermore, it appears that the writers of the report are unfamiliar with the curriculum in both the departments of English and Communications where media literacy is covered in multiple courses along with information literacy. The recommendation to move Political Science to the Bush School is faulty because it assumes that public policy and the study of political sciences are the same - they are, indeed, drastically different. Merging the University Libraries with this new proposed college would drastically impair how our libraries function. Currently, we have multiple collaborative endeavors with our librarians in a variety of methods including the creation of award winning OERs and the embedding of librarians into our first-year writing courses. We function well because we are able to seek funding from different resources given our different governance. Merging would severely reduce those possibilities. Additionally, creating a library sciences program is something else that will likely not be approved by THECB given our proximity to UT Austin. As it is currently conceived, the University Studies degree is one that is not initially chosen by incoming freshmen; rather, it is oftentimes a degree that assists those students who are struggling to complete a degree program. If it is limited to Arts and Sciences, there are numerous other students who would not be successful in graduating.

Many opportunities for museums and existing strong partnerships with Bush Library & Museum/NARA. Consider continual rotation to highlight research breadth and depth, especially noting ties to Texas history, TAMU(S) role in the state etc., in addition to Natural History Agriculture or Agriculture and Life Sciences as a pillar will resonate with diverse "stakeholders" better than AgriLife. The College of Agriculture and Life Sciences is the academic anchor for the Agencies united as AgriLife. School vs Institute vs College is used loosely throughout the document. Clarifying structures will be necessary – importantly because they affect the flow of dollars and credit. Visualization has many applications and interest from DOD, engineering, med, science, etc. Need to be careful to not pigeonhole as an Art

function only and encourage broad multidisciplinary interactions. Discussion of Biology programs overlooks the disparate skillsets emphasized between, for example Conservation Biology and Microbiology, and neglects the 6 different majors offered through the Biology Department. This document also neglects the recent faculty investment that has elevate Biology's stature and productivity substantially. Attracting some students to Biology within COALS would be more difficult than to Arts & Sciences. How will an undergrad degree program managed in an institute - financial structure, faculty instructors - credit and reporting lines, identity, etc.? Putting a pre-professional program like BIMS into the proposed structure would likely cause the program to suffer without strong clinical relationships that currently exist. Moving undergraduate BIMS to a new COALS institute is expected to significantly disrupt faculty effort and fiscal resources that support the CVMBS mission critical research activities and veterinary and graduate training. Very few CVMBS faculty have effort allocations totally dedicated to the undergraduate BIMS program. The approach to a general first year biology program - like engineering's approach - is appropriate. Managing the credit hour cap to get students to their elective courses is the challenge. Recommendation 9b investment in a new Small Animal Hospital with the goal of a "destination" hospital will both require and provide education and training of veterinarians, vet techs and nurses, and other trained professionals. It's not clear how eliminating the undergrad major improves focus on the core mission. A successful hospital would attract even more students to the program. Recommendation 9b VPR staff, AV should be included in discussion of clinic design, structure as contributors of animal research care perspective and building related compliance recommendations. Recommendation 9b If vet medicine evolves as human medicine has done, the equivalent of nurse practitioners or other skilled titles may become important in the future. Recommendation 9b Close ties of BIMS with the clinical program faculty is helpful for preprofessional students. Recommendation 9b 5 Remember that COALS is part of TAMU. Recommendation 9d Merging HLKN and HPCHS makes some sense. May wish to consider focusing a college on human focused health activities together, e.g. HLKN, KINE, Nutrition, public health, parks & rec, architectural landscape and spaces designed for health, hospitality, food science, etc.

---

The recommendation to combine liberal arts and the college of science is not in the best interests of the school. I was previously at a 4-year institution which wanted to implement similar changes, and while faculty successfully blocked some attempts others went through. The given excuse was "This will save money", but no one believed that, and indeed it was later shown that it did not save any money. What did happen was the morale lowered as well as the opinion of faculty towards administration. The current explanations that "Other schools do this" and "it will balance the numbers" seem to come from a consulting firm that does not understand academia. I am hoping this will be an example where administration listens to the faculty of science instead of being moved by other motives.

---

I would like to see the focus aligned with the core missions of this university. Efficiency (fewer positions, perhaps less salary cost) should not win out over efficacy (as researchers, knowledge creators, educators). How, specifically, will the proposed changes benefit our core missions? What metrics will be put in place to ensure we are meeting these benchmarks toward improvement? How will involved units provide input? How will lost time and effort related to moves, dismantling of departments, etc. be compensated? The rationale provided for several drastic changes appears to simply be that other universities do so. However, there doesn't seem to be a recognition or valuing of current strengths or previously stated goals of this university. I have concerns about the unexamined effects of these changes on every aspect of our mission. I, for one, am very interested and invested in seeing us continuing out upward trajectory in growing as a top tier research institution. Many of the consolidation suggestions will certainly have short term, and likely have long term, effects that hinder this trajectory (see comments on IT and HR below). I am concerned that the proposed realignments were not informed by the would be affected faculty. There are several places where the roles of units are considerably misrepresented and clearly misunderstood. For example, moving of the libraries to a single college misunderstands the vital function of the libraries and librarians for the university as a whole. I would argue (as a faculty member) that our libraries are a shining star of this university - far superior in their expertise and service to the education and research missions of the university than any other institution I have seen. A strength to be build upon on how to work effectively across units, disciplines, and institutions. As an assistant professor that has already had to rebuild my lab due to a building move, I am concerned about another delay in research productivity in having to relocate as part of the restructuring. My ability to maintain and get new grants is dependent on a functioning laboratory and research infrastructure. I would like/hope to see serious consideration of cost to research time and effort, essential research, and support - particularly for those of us who are in crucial career building stages. I also am an interdisciplinary researcher. I agree that there is a lot TAMU can do to support and facilitate collaboration across units. However, this goal does not seem connected to the restructuring recommendations. In fact, our interdisciplinary units

are differentially handled and moved across several other locations.

---

I've been at A&M long enough that when I joined the Department of Communication the university was in the process of dismantling the Journalism program. I didn't think that was a good idea at the time and I've been supportive of bringing displaced Journalism faculty and courses into our department, creating the Journalism certificate in our College, then bringing the journalism program into the Department of Communication (which only happened recently). I would like to see Journalism flourish at A&M--I agree with the report that journalism and journalistic skills are important for democracy. I'd go even further and suggest that with all of our connections to social media we all now have the power of journalists, editors, videographers, and fact-checkers--and we all have access to the public sphere. It is dangerous that we all have this power without any training in journalism skills. We ALL need journalism training, just like we all need training in other aspects of communication. Issues such as news values, privacy, defamation, news frames, agenda setting and more are relevant to each member of the A&M community. Indeed, journalism and communication skills are so important that I'd rather see the Department of Communication turn into a Center/College for Communication with a Journalism degree. According to the report, faculty rank communication skills as important for student success, and they are, but they are also important for the proper functioning of our public sphere. ("When faculty and staff respondents were asked to rate the importance of various skills to student success, three factors were rated as important or very important by almost all respondents (96 percent each): 1) Development of core skills like communication, critical thinking, and quantitative reasoning; 2) Ability to collaborate and connect with others" MGT report, p. 7). A Communication Center or College (or whatever makes sense as larger than a "department") would provide synergy and leadership throughout the university. We could continue to produce students who are skilled in Health Communication, Media Studies, Rhetoric, and Organizational Communication in the Department of Communication and add a Department of Journalism. We could (for the first time, I believe) oversee the KAMU PBS/NPR stations, which are woefully under-utilized. We could bridge to courses taught in Marketing/Advertising in Mays, and courses taught in Agriculture. We could support university MarComm efforts and help to train faculty to be experts in public scholarship. There's a lot that we could do with a vibrant Communication Center at Texas A&M. The University of Texas has a thriving College of Communications, we could look to it for inspiration.

---

The College of Arts and Sciences isn't a bad idea, and would potentially come with salary savings from duplicated administrative positions under the new organization. It seems bizarre to me that biology would no longer be grouped with the other sciences, as is the case at all of the top 150 US universities with the exception of Cornell, or indeed, worldwide. With 21 million dollars in external funding in the past year, the biology department would appear to be relatively efficient compared to peer schools that are being incorporated into arts & sciences.

---

The Biology department is a basic science research department that is on a steep upward trajectory, and has significantly increased in ranking despite little investment from the University and with a poor research infrastructure. Three years ago, we developed a research strategic plan that we are committed to implementing and to its success. In our first year of implementation, we hired 5 stellar new faculty whose research complements and expands our strengths in Biological Rhythms and Microbiology, including Wanhe Liu from the lab of Nobel Laureate Michael Young who received a 2M CPRIT recruiting grant to come to our department in the College of Science. These hires would not have been possible if Biology were not a strong and forward-thinking department and surrounded by excellent and diverse colleagues in the College of Science. A similar effort is underway to hire 2 evolutionary biologists, and 1 microbiologist this year. The possibility of moving the department to COALS, or disbanding the department, obviously seriously undermines these efforts and our current upward trajectory, and critically risks our faculty and staff leaving TAMU, including several Biology faculty who are on track to become National Academy members. In addition, the world renowned strength of our Biological Rhythms group is helping our current efforts to recruit a Nobel Laureate to Biology. This effort would undoubtedly fail if the department were moved to COALS and/or dissolved. On the other hand, imagine what we could accomplish if investment in our strategic plan continued, as indicated in the MGT report is needed, including a projected improvement in rankings to a top 30 Biology department, which would occur in ten years or less. Importantly, we are not opposed to constructive criticism and to making significant changes to improve. This is reflected in how we critically examined the department in our strategic plan. For this reason, we recently hired an ambitious and forward thinking outside Department Head who has developed aggressive plans to stimulate underperforming faculty, and who is fully committed to executing our strategic plan. This is working: in 2021, our faculty received, or have grants pending with scores within the payline, over 20M in new grant funding, primarily from the NIH. Despite our eagerness to improve, for some of the reasons listed below, I (we) are NOT in favor of moving our

undergraduate program and department to COALS. The MGT report states that most peer institutions do not have Biology Departments. This is unfortunately not correct. Of the 52 institutions ranked above TAMU (not including medical schools), 28 have stand-alone Biology Departments. The other 24 have two or three departments comprised of biological sciences disciplines, such as Genetics. a. Culture: Faculty and students in Biology have few natural connections with COALS, with the exception of Biochemistry, but have significant and fruitful collaborations within the CoS. As indicated above are a basic research department, not an applied research department. We make discoveries that can be used in applied research. Biology faculty are currently working closely with Chemistry to build a new program in Synthetic Biology, which was part of both of our departmental strategic plans. Programs in Bioinformatics in Biology, Math, and Statistics is another example of an area of growth and collaboration. If change is needed based on a fair, data driven analysis, an alternative to explore would be to move Biochemistry to the CoS to strengthen ties with Biology, Chemistry, Math, and Statistics. If one goal is to strengthen ties between Biology and faculty in departments in COALS, this can be done using joint appointments. Graduate students and undergraduate students who apply to Biology want to be in the College of Science. I (we) are deeply concerned that a possible move to COALS would undermine our success in recruiting top students. Furthermore, the majority of our faculty are funded by the NIH. I (we) are extremely concerned that a move to COALS would negatively affect our ability to be successful in NIH grant applications, which in turn, may negatively impact faculty recruiting. We agree that undergraduate programs, particularly BIMS, that partially duplicate offerings from Biology may confuse students. Thus, we would enthusiastically participate in the new Institute of Biological Sciences to help clarify and coordinate undergraduate Biology education. Biology is uniquely positioned to lead the integration of these programs. Currently, students in both Biology and BIMS take a progression of four Biology courses over their first two years that are taught by Biology faculty. Upper-level course redundancy, particularly in Microbiology and Anatomy & Physiology, can be eliminated by unifying existing courses. In addition, should BIMS be placed within the new College of Arts and Sciences, all major service courses (including Math, Chemistry, Statistics, and Physics) would be housed within a single college, streamlining the advising process. We would generally support a merger of the Colleges of Science, Liberal Arts, and Geosciences. In a recent meeting, faculty and staff expressed unanimous support for placement within the proposed College of Arts & Science. This will continue to facilitate existing research collaborations and forge new collaborations, along with continued teaching excellence. For instance, several of our faculty have close collaborations with faculty in Psychology in combined efforts to develop therapeutics for spinal cord injury, and there are also many potential collaborations with researchers in Geosciences who are interested in, for example, biological processes associated with petroleum, and geobiological approaches to study evolutionary processes. The department is actively developing plans to enhance biology education by implementing virtual-reality in the classroom through a collaboration with the Department of Visualization. Therefore, the proposed restructuring in Arts and Science would facilitate collaborations and the long-term objectives to increase high-profile interdisciplinary research that increases external funding and rankings. Furthermore, given the increasing emphasis we are placing on having our undergraduates be able to communicate results, I believe this merger will facilitate improved teaching. Personal and broader implications— I recently was informed that a new and major donor to TAMU is interested in funding aspects of my research program. The plan, as I understand it, is that the donor will provide an initial \$500K to my lab, and I believe the same to a second lab in another department and college. This is meant to be an initial investment to develop a relationship with the College of Science and TAMU, with the potential of additional significant donations in the near future. However, the MGT report stating that there is a “perception” that Biology is underperforming, while all data indicates otherwise, would likely deter this donor, or anyone, from investing in Biology, the College of Science (or Arts and Science) and TAMU.

The survey did not ask about academic realignment and it does not seem that many faculty/ deans/ department heads were consulted by MGT in preparing their report. This campus has many experts in organizational operations who have criticized the unscientific way in which the survey was conducted, included the unequal sampling of former and current students. I would support the creation of a University-wide taskforce to conduct a full study into the creation of a College of Arts and Sciences so that the people affected can play a part in shaping this college. This would ensure that the new college stands on firm grounds. I vehemently disagree with the reports conclusion that "the current Department of Biology is underperforming and there would need to be a significant investment to bring the productivity to an acceptable level." The biology department has an excellent reputation on campus and across the US. They are already investing significant amounts for new faculty hires that will even further strengthen the biology department. Further the conclusion that most of our peers do not have departments of biology is not correct - Cornell is not a peer institution. The following large land-grant Universities all have biology departments (with some separating Integrative

Biology and Cellular and Molecular Biology): UT-Austin, University of Illinois-Urbana Champaign, University of Michigan, Michigan State University, University of Colorado, University of California Berkeley, UCLA, Florida State, to name just a few. Of note, these departments are all in Colleges of Life Science, Sciences, or Arts and Sciences, and are not in Schools of Agriculture. Biology is a basic science while agriculture is an applied area. The suggestion to move the Institute for Neuroscience (TAMIN) to the VP for Research is not supported in the report. TAMIN is highly focused on graduate education through its PhD program and helps to coordinate the new undergraduate neuroscience major. This institute needs to remain under the Provost's office and the Graduate and Professional School so that the academic mission of TAMIN can be properly supported.

---

While I, personally, am very comfortable with the structure of a College of Arts and Sciences, most of my colleagues are not, in part because in this document the transition process and the details to its implementation seems both unclear and rushed in this report. In humanities departments--interestingly, "humanities" is mentioned exactly once in the body of this report: humanities appear to have been replaced by "arts", which in the past the coordinating board specifically has stated we cannot offer--in particular there is a real fear that rather than strengthening the the profile of humanities in this University, that humanities will continue to be minimized. Too many of the social science departments in the current CLA are supposed to be split off to the Bush School; people are very concerned that rather than becoming a STEAM university, we will fade into the background and become even less visible. I also can't imagine that the department of biology will be happy being sent to Agri Life, a scheme which has been resisted for many, many years and their reasons have not changed. While getting rid of BIMS is probably a very good idea--students in that program are vocal in their complaints--losing Biology from the College of Science (or Arts and Sciences) is weakening basic structures. It is also baffling why that department is described as being "perceived" as being "under-performing" when the metrics show it is not.

---

As a faculty in the Department of Visualization that teaches (mostly all of the) Design courses currently offered at TAMU, I love the idea of moving VIZ to a new college. I also think we should have a Department of Art and Design. We have an Art Minor currently, but this does not give students the curriculum needed to graduate and pursue a position in the design industry. We are missing an entire segment of the Fine Arts population. As a top-tier University, why do we not support the arts more? The want is there, I see this every semester with very long waitlists and students trying to take the limited design courses we currently offer. Also let it be known that we do not currently offer a Bachelor of Arts in Visualization, only a Master of Fine Arts. I would love to see a BA in Communication Design (or something similar). These programs at UNT, UT, Tech, Texas State, Etc. have been going strong for years, and I think A&M should be able to compete. I am 110% support a new School of Fine Arts with a BA in Design and/or Communication Design.

---

The restructuring proposed for Biological Life Sciences in Finding 5 has the potential to negatively affect a lot of Biologists, including myself, on campus. Importantly, the premises of such a restructuring as elaborated in the report seem to rely on a 'perception' that our current Department of Biology is underperforming. It is not clear where this perception comes from, but it is erroneous and not supported by data. In contrast to the said perception, and based on a number of quantifiable metrics, the department of Biology is on an upward trajectory and perhaps the leading life science-related unit on campus. Measures of marked improvement are seen in i) the success and retention for ALL life science majors (DFQ rates decreased by 30% in the last 5 years), ii) first year retention of Biology majors above the current level campus-wide, iii) number of majors and diversity above that of the rest of the University, iv) significant increase in federal grant \$, and v) increasing output of publications both in terms of number and impact. A formal external review by a single committee of all life-science units on campus would most likely demonstrate that Biology is not underperforming but is rather at the leading front campus-wide. The lack of clarity as to whether faculty in Biology would remain together or dispersed throughout the institution is a problem. Changes that would negatively impact faculty career trajectories would inevitably lead to a loss of talents at TAMU. Some sort of cost-benefit assessment of the proposed restructuring should be performed and presented with transparency.

---

1. The report itself, in its introduction, states that "The consultant team was asked to identify changes that would restructure TAMU in a significant way to increase effectiveness and transparency and to contribute to overall student success." However, there are few, if any, references or recommendations targeting improved/better student outcomes. Shouldn't better student outcomes be a top priority? 2. The report speaks of a four-legged stool, but as it does, it appears leave aside the Mays College of Business and the College of Education, for example. Are they independent of A&M? Or are they a fifth, sixth or more legs? No "restructuring" is recommended for Mays, for example, so perhaps it is the model for all the other entities? 3. The report appears to ignore or not take into account its own internal recommendations. For example, the report recommends to merge Liberal Arts, Sciences and Geosciences in order to

create a college of Arts & Sciences with 23 departments, 124 degree options, 14,000 students. But the report later goes on to recommend removing Political Science, and possibly Economics and International Studies, from the mix; it recommends removing Biology and moving it to AgriLife; and it recommends removal of Performance Studies and placing it in a school of visual and performing arts. So, the report's own subsequent recommendations have the effect of cutting off some of one of the legs of stool, creating an imbalance and drastically reducing the adduced numerical strength of the "new" college of Arts & Sciences (presumably to a college of 18 departments and @10,000 students). 4. The report further ignores its own internal recommendations when late in the report it adds, at least partially, VetMed and Biomedical Sciences to AgriLife, lengthening/ strengthening one leg of the stool so as destabilize the purported advocacy balance. 5. As the report adduces the University of Michigan as a peer institution to be emulated, it glosses over or ignores the UM has 19 colleges, and its College of Literatures, Sciences and Arts houses 75 departments, where both the number of colleges and number of departments are wholly dissimilar to what is proposed for TAMU. 6. Before it starts, the report concludes that "This larger college structure creates a stronger advocacy for the liberal arts education at a STEM-focused university. This advocacy is a value in recruiting faculty in the arts, humanities, and social sciences which are often underrepresented at STEM-focused universities." The conclusion contains two assumptions that at the very least ought to be subject to question as they reveal a strong bias underlying some of the report's conclusions and recommendations. The first is "STEM-focused university." A&M's mission as a land-grant institution tasks it with serving the people of the state, which, depending on the moment in the state's history, may or may not make a STEM focus an imperative. Business is not STEM, and Sonny Perdue (Secretary of Agriculture) tells us that STEM education is really a vital component of agricultural education," but he doesn't go so far as to say agriculture is STEM. The report's idea that larger college "Creates stronger advocacy" is an assumption based on a sort of "might makes right" notion that is a tacit justification for violence (the mightier over the weaker) against the strength of ideas, which should be the currency of a university. 7. There appears to be no reference to specific, actual dollar savings nor to whether or not proposed "cost-savings" will compensate, for example, for the creation of at least two new VP's in the president's "cabinet." 8. The report has no particular concern with the care for the humanities as such. The Visual and Performing Arts development would be good, if done at the appropriate funding level, but again: a strong separation between visual and performing arts, and Hispanic and English literary studies and whatever remains of literary and cultural studies in International Studies such as it is configured currently, spells trouble for the future. The Humanities cannot thrive and cannot even survive in the absence of an appropriate and sufficient context. It is such context that seems to be just about to be terminally taken away. Not only are there no provisions in terms of funding a Center for Latin American Studies or Mexican-American Studies, the absence of which is nothing less than absolutely embarrassing for an institution pretending to be Hispanic-serving in the state of Texas, or any other Center of the kind that good, solid research institutions have and will continue to have (Critical Theory, Global Studies, Cultural Studies, Area Studies in general, etc.), but the tendency seems to be a continuous reduction of living space for at every level. The pretext of a poorly functioning and constantly declining Humanities Center can no longer serve as an excuse. 9. The idea should be to foster cooperation and aid the Humanities disciplines to become strong, rather than to weaken them and drive them into slow extinction, something clearly in sight for some remaining departments in Liberal Arts, where many things could be done. a. Among those things that could be done is NOT taking International Studies to a School of Public Policy, because INTS at TAMU is not an international-relations organized unit, rather a cultural-studies focused one. b. Among those things it is NOT leaving Hispanic Studies and English as marginal actors in a College of Arts and Sciences as miserable remnants of a past that this University should pay closer attention to, as it will come back, since every past always comes back and not necessarily as farce. When this university wakes up to the reality of what has been done to the Humanities, drop by agonizing drop, it will be too late. c. If cinema, art, performance, and music are to be housed in some newly proposed institutional development, it might make more sense for International Studies, given its actual cultural studies composition, and for Hispanic Studies, and for English, to be housed with them, rather than arbitrarily split into alien houses. Is it so hard for consultants writing a report to think about including "Cultural" in Visual and Performing Arts, as a third element?

Wondering how Arts and Sciences would be an improvement over two Colleges. Some have said CLA could get a better Dean. True, we have had some crummy Deans in CLA, [REDACTED]. In the long run, why is it important if we have a "four-legged stool structure"? I don't see how this could help faculty at all, or increase the stature of the university. Establish a Department of Journalism. Should be a Department of Mass Media that includes journalism. Elevate and expand the Bush School of Government and Public Service to be a highly visible and accessible part of the university portfolio through significant investment and a merger with the Department of Political Science. What do

faculty members in Political Science think about this? Bush School faculty? They should be the first ones consulted. Recommendation #6: Merge the University Libraries into the newly created College of Arts and Sciences and create a new Department of Library Sciences. Our library is excellent and I don't think that our fine librarians need to be faculty and have to publish or perish. Why is this necessary? Recommendation #9a. Reassign the University Studies degree program exclusively to the College of Arts and Sciences. Who is going to hire these students with that degree? Universities tried this in the 1970s, and many of them dropped the idea since these students usually are the last ones hired, often as salespeople.

The proposed combining of colleges is a huge undertaking and reorganization of the university. I am deeply concerned about the short time periods involved (the speed at which the report was written, how short the window for feedback is, and how quickly this is to be implemented) and I am very troubled by the lack of details and a clear cost-benefit analysis of this substantial realignment in the report. This lack of detail makes it very difficult to give constructive feedback, because it is completely unclear, for example, what resources would be provided to the new combined college. I think most people would agree that the sciences and the (liberal) arts have very little in common and that there are much fewer obvious collaborations than between, say, science and engineering. In other words, there are very clear reasons *against* combining the colleges (although these are not really discussed at all in the report). The main reasons provided in the report *for* combining the colleges are the resulting large size and that arts and sciences are in a combined college in some other universities. However, the report offers very little discussion of why a larger size is necessarily better (and there are clearly disadvantages to large size), and the university as re-organized would still have many smaller units/colleges (e.g., business school, Bush school) which strangely are not recommended to be combined (even though there are some much more obvious combinations there, compared to science and arts). The fact that arts and sciences are in a combined college in some other universities is also not in itself a reason for doing the same here. These combined colleges in other universities exist largely for historical reasons -- I am unaware of *any* precedent (in the last one hundred years, say) of any large university combining two existing distinct units of (liberal) arts and sciences into a combined college. I am also very concerned by the way the Department of Biology was maligned in the report, when its performance is objectively much better than that of many other units (e.g., med school) that received much better treatment in the report. It does not make sense to me to move this department entirely to the College of Agriculture and Life Sciences. This does not seem to make sense for all of the fundamental biology researchers. My understanding is that several high-profile professors may leave the university should the department be moved, and that it may be much more difficult to recruit certain researchers in the proposed system.

I teach journalism at A&M and see the need for more resources. My concern is that creating a department from scratch could be inefficient when journalism can be expanded in the Communication Department where it now resides. The report points to other universities where they graduate more journalism majors but it overlooks that those programs included communications in their departments/schools. We have made progress already and have plans and insights on how to grow to serve students and the community. This commitment from the university is fantastic and we can meet and exceed those expectations while building from the base of the Communication Department.

I do not object on the face to creating a new College of Liberal Arts & Sciences, though again, the rationale for doing so could be better supported. It's not clear that mere numbers of students and departments will put this new college on equal footing with the colleges that have associated extensions and "super deans." Moreover, the argument that other institutions use this model is not compelling. Are these institutions satisfied with the model of Arts & Science colleges--were they intentionally created? ---or did their colleges simply come into existence because of institutional history? As with all units, the success of such a large college with diverse teaching, research, and service requirements will require strong leadership. Another concern is the see-sawing recommendations. The report seems to be prepared without a knowledge of institutional history, PERF courses have been recently created from courses formerly labeled with other prefixes, and now the mandate is to create new departments. No mention was made of the recent changes -- what has changed to compel the realignment? Likewise, TAMU once had a major in journalism, which was eliminated. No mention is made of the previous major and why it was eliminated and why the situation has changed to once again make a journalism department and majors viable. As an aside, a major in print journalism does not seem forward thinking. I object to removing the Department of Biology -- a critical component of the sciences out of the College of Science (or proposed College of Liberal Arts and Sciences). It doesn't make sense to pull Biology away from the important existing collaborations. If anything, the Biochemistry and Biophysics department should be moved TO the College of Liberal Arts and Sciences. Any issues with undergraduate majors can be resolved through new policies and procedures as far as change of major policy and advising. Reassigning the University Studies degree to the College of Liberal Arts and

Sciences does not meet the needs of students who are seeking "build your own major" options in Business, Engineering, or Agriculture. Why doesn't the rationale of a college not having to be distracted with students who do not have the qualifications or interest to enroll in a College degree program apply to the College of Arts and Science? One issue that was not addressed in health-related majors is the requirement that students changing to Public Health must be core complete, making this major fairly inaccessible. However the consolidated programs/degrees are created, they should be designed so that students can utilize them more easily.

See comments above. I would also point to NC State University as a cautionary tale. They realigned colleges and resulted in destroying a world-renowned Genetics program. The university bled faculty as a result (in part) of this realignment (several came to TAMU). If this goes poorly...it is a huge problem. Please be careful about implementation here with clear attention toward student experiences and faculty / staff morale.

Combining the Agrilife and Biological Sciences sounds like a good idea on the surface, but I have reservations about how this might work. Many of our students in the Biological sciences take courses in Heldenfells, and having to go across campus for advising, etc. might pose significant logistical problems for many students. Many students in Anatomy & Physiology also go on to take courses in Kinesiology, which is housed in Heldenfells. Expansion of the current research programs in the Biological sciences is a good idea, perhaps even renaming the Biology Department as the Biological Sciences and Molecular Biology department might possibly help to attract more quality research scientists to the university. The University of Texas at Austin created their own Molecular Biology Department and split it away from the Biological Sciences Department. Combining the Biology Department with Agrilife seems like a logistical problem to me, and might make communication problems even worse. These are my observations and concerns as a full time employee here at the university for the past 7 1/2 years.

The combining here and the reorg of biology seem a good idea.

I am highly skeptical about the value of the proposed consolidation of liberal arts, geosciences, and science into one college. Most of the rationale given in the report are almost completely vacuous (especially without further details), and there are many risks and costs associated with such a move. The rationale that a slight majority of "peer" institutions have combined arts and sciences colleges is completely unconvincing. An omnibus college of arts and sciences is in some ways more of a historical relic than a carefully considered academic structure for a modern setting. Citing the University of Michigan as an example (as the MGT report does), the UM-LSA website indicates that the college has been around for 175 years. Thus the very diverse set of departments in the college have a long tradition and culture of being in the same unit. It is very different to think of merging units that have grown up separately as opposed to having this kind of history. In addition, the reputation and quality of the departments at UM is much more homogenous across LSA than it would be in such a unit here. Finally, if one wants to look to peer institutions as a model, it isn't clear to me why other models weren't considered that might fit the culture of A&M better. U. Minnesota for example has a College of Science and Engineering. Given our culture and history, this makes a lot more sense for A&M than the proposed structure does given the greater similarities in research modalities between science and engineering vs. science and the humanities. The catchall rationale that centralization is good is pretty much worthless. The proposed merged college would have a very diverse set of units in it with a very diverse set of cultures and needs. These would have to be carefully considered in the administrative structure if the result is to be strengthened units and not weakened ones. Going back to the UMich example, their LSA college has an overall dean, then subdeans for humanities, natural sciences, and social sciences. That is a gain of administrators, not a loss. There would also have to be separate infrastructure for other services; research support for example could not be consolidated much without losing function because funding agencies, etc. differ so much between the different areas. In short, I believe consolidation will only yield significant savings if it is done on the cheap and in a way that causes damage rather than progress. Finally, the report points out that a single merged college could have more political clout within the university. There may be some merit to this, but in the end the health of units in the university depends MUCH more on the intentions and priorities of the university administration than on the college structure. I have previously worked in a university with a combined college of arts and sciences. It is true that there may have been some administrative efficiencies due to the combined structure--there was for example a single dean with no area subdeans as UMich has. However, it was not a good place to do science. We had a series of deans from the humanities. Some were well-intentioned towards the sciences and some not, but all struggled to navigate the diverse set of cultures and needs in the college. The unit most definitely did not have strong or proportionate clout in the university. Very often the main efficiency that seemed to be gained from having a combined college was the ability to efficiently marginalize and underfund the departments in the college as service teaching units

rather than to strengthen them into robust units with a strong focus on research and scholarship. I VERY strongly preferred moving to A&M and working in a College of Science with a more focused identity and stronger support. Given the current situation at A&M, I think it is most likely that one of two things would happen if the merger were carried out as proposed. Either all units would suffer, or some currently weaker units (generally the humanities) would see increased investment at the expense of the ones that are currently higher-ranked (generally the sciences, broadly construed). Raising the level of ALL units--which I hope is the goal of the incoming administration--would require both a strong monetary investment (especially if any of the new departments and programs that are proposed come to fruition), and a very thoughtful construction of the new administrative structure. It is clear that the merger would be quite costly in the short term in terms of faculty, administration, and staff time and effort. It also comes with a lot of risks and potential downsides. There is some upside potential, but I view it as being minimal and unlikely to be realized. There is some intellectual attraction to the liberal arts model of arts and sciences, but this is in some ways anachronistic in modern scholarship, and it also does not fit the unique culture of A&M. Why not work with and build on our culture instead of trying to squelch and supplant it? I am also highly skeptical of real cost savings unless the administrative structure for the new college is done on the cheap, which will immediately weaken departments and not strengthen them. On the other hand, if an A&M president wants to strengthen the units that would be in the proposed new college, they can do so without the new administrative structure. Building a stronger arts identity and presence for instance requires investment and will. It does not require the new units to be in the same college as the sciences. In the end, if the merger goes forward, I am very concerned that it is done with a view towards strengthening all units and less so with a view towards cost savings. Otherwise this will end up weakening all of the departments in the new college, and by extension the whole university.

---

I recommend to include or integrate biological programs (from College of Science), biomedical programs (from Vet School), and kinesiology programs (from College of Education) into COALS. This should be the only move to enhance our national and international competitiveness.

---

Recommendation #5 is a perfect combination between intellectual incompetence and academic ignorance. 1. What is "Institute of Biological Life Sciences"? Which Life Sciences are not Biological? 2. Merging the Department of Biology in to AggrLife will be a huge mistake because few of the Biology faculties study agriculture-related topics. Instead, It'll be a better idea to merge the Department of Biochemistry and Biophysics into the College of Science. 3. Sending Biology faculties to AggrLife could potentially cause the loss of many faculties, especially the junior ones. This loss will cause the university tens of million of dollars and a couple of decades to recover. 4. Merging the Department of Biology in to AggrLife will cause the loss of many undergraduate students, which is against the mission of the university.

---

As a tenure track (but not tenured) faculty member in the college of liberal arts, I have to chief concerns when it comes to the proposed academic realignment: assessment and resource allocation. Assessment: Fields like chemistry and physics have very different research strategies than departments like anthropology or history. Our research tends to take longer and the end result looks very different. It would be impossible to evaluate the academic success of a faculty member from the English department by the same metrics that one would a geologist. If these wildly disparate fields were to be all combined under one massive tent, I would suggest having smaller sub-units evaluate academic performance. Resource allocation: The impression that I get is that A&M prioritizes STEM programs over the liberal arts programs. The university is largely understood to be an Engineering school. My concern is that the twelve departments in the College of Liberal Arts now will become second fiddle to the STEM departments that they would be combined with.

---

The removal of the Biomedical Sciences UG from CVMBS will have a profound impact on the College. The faculty teach in the DVM, grad and undergrad programs and the students -intending on careers in biomedical fields- develop a professional approach as they are embedded in a professional college. The UGS help with research in the college and develop excellent skills. The BIMS program has an excellent reputation. CVMBS needs to increase its research portfolio and that is the main weakness that holds us down in college rankings. Developing the Arts is an excellent endeavor and will improve the culture in the area.

---

I am strongly opposed to the idea of breaking up the College of Liberal Arts and merging some of the remnants with Science and Geosciences. It is worth noting that no deans, faculty, or departments impacted by this proposal were consulted in this process. The only advantages of such a move that are described in the report fall into two categories: bigger is better, and this will make us look like other universities. But bigger is not always better, and I am not clear on why looking like Michigan is such a sought after target. Who ever became a leader by mimicking others? There are several concerns that arise from this proposal: 1) Where do the Humanities fit into this? I see that the report discusses

the Arts, and the Social Sciences might have a fit within a larger College of Arts and Sciences, but what about the Humanities (incidentally, I am not sure the report writers understand the distinction between Arts, Humanities, and Social Sciences)? What happens to the many faculty and students who study Humanistic questions? 2) How will promotion and tenure decisions be made? Can a Physicist fairly assess the research productivity of an Assistant Professor of English? Or can an Anthropologist fairly assess the research productivity of a Mathematician? 3) How will merit allocations be determined? 4) Will there be equity adjustments for faculty, staff, and students when they move into the new College? I only have data for faculty, but the median salary for Science faculty is \$139,000, the median salary for Geosciences faculty is \$117,000, while the median salary for Liberal Arts faculty is \$104,000. I assume similar levels of pay inequity will exist for staff and graduate students. Will these pay inequities be addressed? 5) How will resources be allocated to departments? How does one Dean scale the needs of departments that have vastly different resource requirements? Will this create a class system of haves versus have-nots? 6) How would such a college be administered at the level of the Dean, without replicating the structure that already exists in the separate colleges? How will leadership of the College actually be determined? I note that the other legs on the stool described in the report are headed by either Vice Chancellors (Engineering, AgrLife) or a Vice President (Health). Will this be the case in a new College of Arts and Sciences? 7) Most importantly, I see nothing in this proposal indicating how this benefits students. So the question becomes, how does this benefit our students? The report also recommends creating a number of new departments in a new School of Visual and Performing Arts. It was my understanding that the Texas Higher Education Coordinating Board had previously limited our ability to offer such programs. The report recommends creating a Department of Journalism. It seems the report writers are not aware that there once was a Department of Journalism, but it was closed down and (I think) merged into Communications. Had they sought feedback from Departments they probably would have had more insight into this. The report recommends merging Political Science (and maybe Economics and International Studies) into the Bush School. However, this seems to stem from a superficial understanding of what these various units actually do. What the Bush School and the Department of Political Science do are quite different things, and I do not think such a proposed merger would benefit either unit, and especially not their students. The report recommends creating an Institute of Biological Life Sciences. That title alone speaks to a lack of understanding; it should either be Biological Sciences, or Life Sciences, not both. This recommendation appears to not understand the distinction between basic research (e.g. Biology) and applied research (e.g. Biomedical Sciences). As an illustration, Biology faculty research questions like: how do genes or viruses or bacteria work? Biomedical Sciences faculty on the other hand research questions like: how do we prevent or treat diseases? Faculty will use entirely different approaches to answer these different questions. The report indicates that merging these units will allow for easier collaboration, but this is another case of fixing a problem that doesn't exist in reality; there are no barriers to collaborative research between these units. I think that moving Biology out of Science is a bad idea. The recommendation that a new Department of Library Sciences be created seems like another bad idea. Did anyone at all ask the Librarians what they thought? How will faculty librarians be ranked? Will they be tenure-stream? How will promotion and tenure be assessed? Will they be required to teach courses? Especially since no courses currently exist? Is there sufficient student demand to offer degree programs? Will they be able to graduate sufficient numbers of PhDs to satisfy the THECB? So many questions, so few answers provided in the report. The report also recommends reassigning the University Studies Degree to the new College of Arts and Sciences. Allowing students to build their own major seems like a recipe for unemployment for the students. Who will hire graduates that follow this approach? Overall, these ideas regarding academic realignment seem poorly considered and weakly justified. Perhaps if faculty input had been sought prior to writing the report we might have been able to work together to craft a meaningful vision for a shared future.

1. COMBINING INTO FOUR LARGE COLLEGES - I have a hard time seeing how things will be better by doing this. Bigger is not always better. Students don't pick you because your major is in the largest department in the nation. They do not pick anything based on there being the large college of so-and-so. I don't see how it helps faculty. To say combining liberal art and sciences into one unit would elevate liberal arts seems silly. I do not agree that it will elevate the arts. I see this as a pure attempt to save money, but see no rationale that it will make any of our programs better. This is not about anything but money. (I am not affected by this, so have no personal stake in it). 2. SCHOOL OF VISUAL AND PERFORMING ARTS - Investing heavily in an area where we have no real expertise seems to be poor management of money. We can't be the best at everything. Put our resources into things that we are good at. The amount of money and time it would take to end up with an truly excellent school of these would be prohibitive and at the expense of things we are already on the way to being a leader at. Yes, liberal arts are often not prominent at STEM schools. That's

ok. I'm saying ignore liberal arts, but this is not where I want to see our money spent. It's fine if we are excellent at some things and not at others. Put your money where it will make the most difference. It's not a new school where we have no expertise! 3. JOURNALISM - No issue bringing this department back and it makes sense. The flowery language aside talking about how this will re-establish trust in the media is silly. But it is reasonable to have a dept of journalism in a school like ours. 4. BUSH SCHOOL - Totally agree. It needs to be more prominent and could really give us even more national recognition than it already does. 5. INSTITUTE OF BIOLOGY AND MOVING BIMS MAJOR - This is probably least logical recommendation and though I am not in those areas (I'm in Medicine), this would be a mistake. The reasons BIMS is a popular major is because it is run by a professional school and taught that way. In Medicine we very much value BIMS students because they come so well-prepared, having been taught with a professional school mindset. To take it away from VetMed will not somehow help this major. You don't fix something that isn't broken. Very bad idea. While I don't know the status of the Biology department, putting it in some new institute does not seem to be a rational fix. If it isn't doing well, get new leadership. All this rec will do is hurt something that is working well and it will not fix what may be wrong with the other. 6. LIBRARIES - No opinion 7. TEXAS A&M HEALTH - No big issues with the recommendations. Though taking unwilling faculty and having them teach a class across campus does not sound like a recipe for success. It seems more productive to have them contribute to the teaching missions within A&M Health.

I agree with the report that previous policies distorted the core missions of some colleges, and that it makes sense to refine and refocus them. In the past, SCH-driven funding formulas drove these colleges to add large undergraduate programs, even if they were tenuously connected to their mission. A new funding formula should really be explained and implemented or we will just drift back to the same situation over time. I also agree that a School of Fine Arts is a great concept that would elevate the university, but is likely to be very expensive. Unless or until a big donor endows the whole thing, can this be funded? If one were designing a brand new, extremely large university from scratch, one could envision a lot of different structures. Given that Texas A&M already exists with a structure that has history, it would seem that to seriously distort and disrupt that structure should require a compelling rationale. But, for some of the changes, the report does not make any strong argument for how the change is an improvement. The main argument presented for a combined Arts & Sciences college is that many other universities have one, as if that was an active choice for a better structure; but, that college structure is mostly just a remnant of the founding days of universities, prior to specialization. In the last hundred years, only three (Rutgers, Ohio St. and Arizona St.) of the twenty cited universities have actively combined liberal arts and physical sciences into one college, while seven have gone in the other direction. Two of twenty use a residential college model which is not directly comparable, and the remaining eight have arts & sciences colleges that date back to the founding of those universities (average age of the colleges is almost 130 years). The only take-away from this is that different kinds of models can work. The report does not give any sense of what would improve if we changed the existing structure. The second argument is cost savings on administration. Its hard to see that could amount to much, since this new larger college will get a new expensive dean and a host of associates. If the business, communications and IT staff are being centralized out of the colleges anyway, there is no savings there either. The final remaining implicit argument seems to be that bigger is better: the combined college would be comparable (but still half the size) of Engineering. However, this document also recommends that three other colleges be cut down to a size comparable or smaller than anything currently in the university. So, small colleges with a special mission seem to be ok. The Bush School is one of those focused, special-mission units, yet this report recommends adding undergraduate program. Unlike the various proposed changes to Provost, Student Affairs and Faculty Affairs, there is no consistent theme or idea behind all of the proposed realignments.

Re putting the Libraries into a College of Arts & Sciences: 1) Moving the library into a College of Arts and Sciences disadvantages the other colleges in the university, setting up an inherent conflict of interest for an institution (the library) that is strongest in its position as being separate from the academic units, but serving them all. Being outside of these units also allows the library to facilitate collaboration between different departments and colleges as well as work to support the more administrative units such as TAMIDS, VPR, etc and be able to address effectively address the requirements of accreditation that occurs at program, department and college levels. In many cases, the services and resources that the library provides to specific colleges and departments are so easily accessed that they may not realize how much work goes into securing online subscriptions, setting up seamless entry and making resources easily available (access to all our subscriptions through Google scholar is one such example) – this behind the scenes work is critical. 2) The proposal of integrated library instruction is one that is appealing to some in the library especially as liaison librarians are embedded in their departments and could easily co-instruct on I-courses (information literacy focused courses similar to W courses) within departments, thereby having a more formal role for teaching (and support learning

outcomes relevant to the university and students ability able to find, evaluate and use information for better results or decisionmaking). Having a co-instructor would also extend the capacity of the departmental faculty, freeing up time to be used elsewhere. Within their discipline is an effective way to engage students with information strategies and methods as it provides both a valuable context and incentive for learning that will stay with them even after graduation. In aligning with the mission of the university, having the liaison librarians (who also work with faculty to support research and are not infrequently co-PIs) move into an information sciences department within the library could be feasible (notwithstanding any administrative requirements or compliance with rules). 3) There are a number of operation services, provided by library staff and faculty, that are foundational to student success and to faculty research alike, specifically Get It For Me and Electronic Reserves. Get It For Me assures that resources will be readily available to faculty (and students) through request – with requested articles/reports/chapters scanned and delivered to their account within days as well as books available for pickup at the libraries or delivered to faculty/staff through campus mail. This service made a very quick and strategic pivot during the pandemic, helping to keep research efforts going during the height of the pandemic – with curbside pickup available for physical materials. Electronic reserves has also been a longstanding service in the library, making course readings available electronically upon request of the instructor. This services provides PDFs of chapters, access to purchased electronic books and links to online articles as well as other open source online materials, thereby saving faculty time and effort and saving students money as they do not have to purchase course packets or books/chapters that are on electronic reserves as well as providing easy access for distance students. This service was also able to ramp up operations during covid to meet the increased demand for course materials and make them available remotely. A College of Arts and Sciences is not uncommon - and it does somewhat represent the Common Core and those classes that are more service-based (with possibility of having the resources allocated to scale such large teaching loads). From the report, it appears that this is where undecided students (or those who leave their designated college for whatever reason) go - which would indicate that this college would likely need to have access to more advisors. A School of Visual and Performing Arts does not seem like an efficiency - and having an entire school (unless there was an area of excellence there other than Visualization) seems like a waste and somewhat counter to the University's strengths (in other words, why would someone come to an A&M school to study arts). Visualization would probably be better situated in Engineering - where there could be shared expertise with CS. Re Journalism - didn't we already do that once? We had one and then it was dismantled. Different units has various pieces - ALEC has a couple including Radio Broadcasting (but the faculty member who got all the equipment donated to the program has left A&M and I am not sure what they have done to keep it up and running). Bush School - putting POLS, ECON and INTS there makes some sense (and I am the librarian for the Bush School and POLS and ECON so I feel like I can speak with some knowledge here). However, the Bush School is a professional program - their emphasis is VERY different than those academic departments and the classes are much smaller and more hands-on (which is critical when teaching about intelligence analysis or policy making)

---

Pages 25-26: Establish a School of Visual and Performing Arts. This section is seemingly written without the realization that the current focus of the TAMU program on theory as opposed to practice resulted from a review by the Texas Coordinating board which stipulated a recasting of the Performance Studies program. I assume that President Banks will need to petition the CB to change the curriculum of Performance studies.

---

The concern with combining Liberal Arts, Sciences and Geosciences into one college is that a dean from a science discipline will not fully understand the significance of research in history or literature, some disciplines will suffer without a proper advocate. There is a loss of intimacy when a single entity grows too big, and the needs of scientists and non-scientists are highly different. While some peer institutions have found a way to have combined colleges, just as many (if you look at all institutions) have separate colleges of Natural Sciences and Liberal Arts. The smaller colleges we currently have allow for better specialization, and I hate to see this university realigned as a system where four mega colleges compete for recognition and resources. Proper administration can allow for resources to be adequately dispersed under our current organization. The department if visualization has many technical strengths that may be lost if they are lumped into a "fine arts" division.

---

The proposal to create a College of Arts and Sciences by merging the two Colleges is, in my opinion exciting. These changes would put Texas A&M in line with other peer institutions that already have Colleges of Arts and Sciences. Moreover, these changes would then create new cultural opportunities for the surrounding community. However, due to inaccuracies / falsities in the report, the realignment of Biology into an Institute of Biological and Life Sciences makes no sense. The stated fact that few standalone Department of Biology departments are present in peer institutions simply is wrong. A simple search says otherwise and making decisions based on false data should not be done.

Moreover, the stated "perception" that Biology is under performing is wrong, also. Nearly every metric says otherwise. Excellent retention rates of our undergraduate students, first year retention in greater than the university as a whole (95.9% for Biology vs. 94.3% for the University). When tasked with lowering DFQW rates (40.7% for BIOL 111 in 2015 vs. 11.2% in 2020), we met this challenge with gusto and did not sacrifice rigor of our courses. The number of majors increased 57% from 2016 compared to 12% at the University. Our graduate courses are sought after by students from across campus due to the rigor with which they are conducted and topics that are offered. We are THE hub for Biological sciences at the University. Our academic successes parallel our scholarly successes. We are on a meteoric trajectory with \$21 million in projected new grant funding (awarded + to be awarded based on pay lines). To say that we under perform in the MGT report is not based on actual data and would indicate that the data was simply not collected. Due to the problems with the MGT data acquisition for Biology's metrics, realignment to the IBLS should not occur. Missing from the MGT report was a threat analysis for the changes proposed. Yes, there was a SWAT analysis for the University as a whole, but without a similar SWAT analysis for each proposed change, the report is incomplete and there are likely to be SIGNIFICANT downsides to moving Biology to the IBLS. For example, the successes that Biology are experiencing in recruiting, teaching and funding is likely grind to a halt. This was not analyzed and would lead to significant loss in revenue for the University. On top of this, the realignment of Biology to IBLS would, seemingly, remove Biology from the College of Arts and Sciences which would make Texas A&M the outlier for all College of Arts & Sciences.

---

In response to Recommendation #2: As a faculty member in the Dance Science Program, I would love to see a School of Visual and Performing Arts with one main caveat - that we are able to continue offering students their kinesiology focus. Establishing a School of Visual and Performing Arts would facilitate collaborations with other disciplines, especially if we were all housed in the same building together along with the Performing Arts Center. The ability to access the Performing Arts Center in our building would be ideal for experiential learning such as lighting design, stage management, scenic design, etc. Additionally, when the stage is not in use for a performance or event, it could provide another space for classes and rehearsals to be used between performances thereby doubling it's purposeful use. Faculty from each discipline of the arts programs need to be consulted on the construction needs of such a space to ensure it would meet the needs of our programs. Given the unique nature of the Dance Science Program curriculum, our main concern in relocating to a School of Visual and Performing Arts would be the possibility of losing our focus on Kinesiology. We are one of the FEW dance programs in the country with a degree in Kinesiology: Dance Science. This degree attracts the majority of our students because they are able to obtain their required prerequisites for entrance into a Physical Therapy doctoral program and other medical fields working with dancers and athletes. An understanding of the unique needs of performing artists is intrinsic to this area of study. Speaking from experience in recruiting for our program, the ability for our students to learn the science behind dance and obtain a Bachelors of Science degree is one of the greatest factors influencing students and parents to choose our program over one of the MANY other dance programs in the state and beyond. Given the appropriate support and opportunities to grow (including obtaining new faculty lines), we would be thrilled to ADD more artistic tracks such as Dance and Visualization, Dance Education, etc. But we cannot afford to lose our identity as a Dance Science program and replace it with solely an arts focus. If Kinesiology is moved into another college, the Dance Program would need support from the University in proposing new degree plans such as B.S. Dance Science, or B.S. Dance and Visualization to the state coordinating board. Without approval of such degree tracks, the Dance program would most likely become non-existent. Given the unique nature of the Dance Science program, and the call for equality that all arts disciplines be equally represented, the Dance Science Program should become its own Department separate from the Department of Theatre and Drama. This separation would ensure that all disciplines have equal representation in terms of Department Chairs and funding as well as the ability to fully develop different and unique discipline programs. Historically, in shared departments of theatre and dance, chairs and administrators are typically drawn from theatre faculty. This creates an unequal balance of representation of the various arts disciplines. As such, the following departments within the School of Visual and Performing Arts should be established: Department of Dance Science Department of Theater, Drama, and Performance Studies Department of Music Department of Visualization, Art and Design (due to the high cross-over of these disciplines) By establishing a School of Visual and Performing Arts, faculty and leadership inequities need to be addressed. For example: Dance has no tenure track positions or tenured faculty. There are 3 full time faculty teaching 5-8 classes each semester because of the "Clinical Position." Performance Studies has nearly 20 faculty, many with tenure or tenure-track lines but who serve a similar number of students as the Dance faculty.

---

While it might appear obvious that technology belongs in engineering, currently the Technology Management program in the CEHD serves a retention role for the university. An average of ten students a year transfer from engineering to

Technology Management and are successful in Tech Mgmt. If Tech Mgmt moved to engineering, these students would probably be lost to the university. Part of the students' success in Tech Management is that CEHD are better educators and part of it is related to the fresh start and the maturity they gained by their lack of success in engineering. Further, taking this program away from the CEHD after we did the work to build it is problematic. Cyber security is a growing field, and I can appreciate why the college of engineering wants it, but when we are doing it well, why take it away. Moving the library into Arts and Sciences shows their lack of understanding of the role of the library. The library serves the whole university. Currently the library spends more on engineering and health than any other colleges. Having the library answerable to the dean of arts and sciences means they could cut the library budget and give that money to math. The library serves all colleges and needs to remain independent. Consolidating academic advisors at the college level rather than department makes sense. We did so in the college of education and students benefited, although I've heard it damaged the service to students when the same consulting company made the same recommendation to Ag. However consolidating academic advising at the university level would mean they will be a "jack of all trades and master of none" Too much local information will be lost. The connection with the faculty will be lost. You can't say to a student to "go talk to the professor, they're helpful" if you don't know the professor. The loss of quality service for the sake of efficiency will damage our student retention. Back around 2014, the HKLN department considered moving to the school of health and decided to stay with the college of education. This recommendation was tested and rejected years ago. The faculty in the department made the decision to stay. It wasn't that the dean kept them against their will. They are health and activity educators as well as scientist. The idea that the college of education and human development is only about preparing teachers is a total misunderstanding of our college. Our most cited and star emeritus professor never prepared a school teacher. She was an expert in research methodology and higher education administration. I teach in higher education, not teacher preparation. Am I also a sign our college has lost focus. We illustrate the principle of lifelong learning and educating the whole person in our college.

---

Finding Five: • I would like to point out that the “program” is not split between 3 colleges. While there is commonality in early courses, the programs offered by these 3 colleges are distinctly different. I would point out that Biology originally served to make more biologists, Ag promoted the development of agriculture professionals, and BIMS sent people to Veterinary School. Over time, premedical students found the BIMS curriculum more aligned with what they would receive in a medical curriculum as the program was fostered by faculty with clinical training (something not present in the other programs), so the BIMS Program grew. • While a student interested in a medical career can choose any route, any confusion can be handled by advising. Is there redundancy between the 3 programs? Perhaps, but the goals of the programs are different. Biomedical subjects have complex intersections with science, society, wellness, and personal development. With a limited number of credit hours available, it is not all of these aspects can be explored by a single degree. • As an aside, the College of Pharmacy is submitting a new undergraduate degree in Pharmaceutical Science that shares common underpinnings with BIMS, BIOL, & BICH. Does the training of undergraduate students fulfill the College of Pharmacy’s mission? • Within the College of Veterinary Medicine & Biomedical Sciences, the assertion that BIMS program competes with the DVM program for “faculty hires, facilities, grants, duplication of current faculty members areas of interest, which hinders the ability of faculty members to collaborate and contribute to advancing research and student success” is mistaken. The BIMS program has no faculty. All faculty who contribute to BIMS primarily come from three departments: Veterinary Integrative Biosciences, Veterinary Pathobiology, and Veterinary Physiology & Pharmacology. Most of these faculty are also involved in the Professional (DVM) and Graduate curriculum. • Very few faculty are exclusively involved in the BIMS program. Most of the faculty who contribute to the BIMS program are APT faculty and are not competing with the tenure track faculty for grants. • The expertise of the faculty hired is determined by their department, not by the BIMS program, so if a department determines to hire several faculty members with similar areas of interest in order to build the department’s expertise in that area then they may do so. The BIMS program has no input into those decisions. • In fact, the discussion that removal of the BIMS program will help propel the CVMBS into #1 status in the nation or AVMA-accredited schools may be based upon limited knowledge as to how those rankings are achieved. • The concept that the BIMS program is a resource drain for the CVMBS is not accurate. As previously stated, the faculty reside in the departments, not in the BIMS program. I am getting into areas where I do not know, but the point remains the same: my understanding is that the BIMS program brings in ~\$26M to the CVMBS annually. I am not confident in that number, but I am confident in whatever BIMS brings in, the BIMS program itself does not receive but a fraction of that back. The rest goes to funding of other programs in the CVMBS, especially the Professional curriculum. Removal of the BIMS program from the CVMBS will negatively impact the CVMBS revenue stream. • The concept that the BIMS program does not align with the Mission of the CVMBS is off base. The

program has been an important part of this College's mission for almost 50 years. If this is to be the foundational point for this move, then please apply it uniformly to all colleges that have developed new programs. • On a side but important note, removal of the BIMS program from the CVMBS would seriously impact diversity at the CVMBS. Demographics in the BIMS program are far more diverse in comparison to the Professional Curriculum. Removal of the BIMS program will eliminate the inclusion of students with intellectual and developmental disabilities; the CVMBS will lose the distinction of being the only College of Veterinary Medicine to include this population of students. • The only place where competition occurs is for facilities. This is due to short-sightedness on the part of the VBEC planning committee. The planning committee was focused on a Veterinary class of eventually 200 students. I asked specifically in a meeting what measures were being taken to accommodate growth in the BIMS program. I was told that there would be no growth in BIMS. This was around 2014, and then President Loftin and then Provost Watson had both contacted the BIMS program and directed the program to increase its enrollment. • With current enrollment, BIMS classes are larger than the average class in the Professional Curriculum. There are numerous outside buildings such as TIPS, TIGM, NCTM, and the old VMS & VMA which can handle increased class sizes. We have already moved some larger classes to the ILCB (VIBS 305, VTPP 434 & 435). The Rationale for Finding Five does not fit the reality of the BIMS program I admit that there are permutations that I am unaware, but it seems like excising BIMS from the CVMBS will not achieve the gains outlined in the rationale, unless the goal of this is to bolster a flagging BIOL program. If that is the case, other programs should be included, such as the aforementioned B.S. in Pharmaceutical Science, the Allied Health Program, the B.A. in Public Health, etc. While Biochemistry was mentioned in the report, it was not included in the reorganization, but should be. If, however, these changes are deemed essential, then I would respectfully ask the President to consider moving the proposed Biological Life Sciences program to the Health Sciences Center. • I would also respectfully ask for the consideration of the name "Biomedical Life Sciences" as "Biological Life Sciences" is a little redundant and does not clearly state the goal of the program. • The majority of the course work in the BIMS program is human/One Health-focused. The majority of BIMS students are focused on human medicine. This is also true for BIOL and BICH. • The College of Agriculture and Life Sciences is a robust program, but it would not give confidence to an incoming freshman that it has a viable path to medicine as much as being associated with the Health Science Center. • The COALS One Health program is also lagging while the TAMUHSC maintains a commitment to One Health. It is my understanding that the Health Science Center, particularly the College of Medicine, is facing some financial issues, which makes moving to COALS a "safe" bet. However, infusion of tuition dollars from BIMS could help ease the Medical School's shortfall. As far as subjects, student goals and faculty expertise, TAMUHSC is a better choice to house this program. If this change is essential, there are some implementation issues that must be considered. • First, as I mentioned, BIMS has no faculty. If you move the BIMS program, the majority of the courses and ALL of the instructors will stay in the departments in the CVMBS. If you transfer these courses to BIMS, that will take UCC, BOR & THECB approval and will not be finished until Fall 2023 (the deadline for changes for Fall 2022 is November 19, 2021). • If the teaching faculty are transferred to this new program, then the departments will need to retain faculty positions in order to hire replacements. As I mentioned, very few faculty are exclusively engaged in BIMS. In my department, 4 out of 27 teaching faculty are exclusively BIMS, but 3 of those are part of the Biomedical Sciences Research Certificate. The rest of us teach in the BIMS program, the Graduate program, and the Professional program. If those who teach in multiple programs are transferred to BIMS, then the Departments need to hire new faculty to fill the gaps. Or the BIMS program will need to hire faculty to teach the courses. • The report mentions a need for a significant investment into the infrastructure so that students have the same experience in this new program as those in the current program. This would require duplication of the existing facilities at VBEC, specifically the Anatomy lab space and the Physiology Lab space. Facilities for Anatomy had a large impact on the cost of VBEC. Physiology labs require the ability to run anesthesia in dogs as well as medically-approved electrical service as we run ECGs, etc., on students. Removal of the BIMS program from the CVMBS will have a negative impact on the College's revenue stream. Transferring faculty and courses from the departments to another college is hugely problematic when dealing with tenure, P&T packets, compensation, collaboration, etc. I cannot speak to changes in Geosciences, the Bush School, and Health & Kinesiology, so I will limit my comments to the removal of the Biomedical Sciences Program from the College of Veterinary Medicine & Biomedical Sciences and transferred to the College of Agriculture and Life Sciences in combination with the Department of Biology to form the Institute of Biological Life Sciences. The only comment that I would make about the proposed College of Arts & Science is that I hope the Promotion and Tenure process is crystal clear. I would not want to be a faculty member in Languages trying to meet the expectations of a Science-heavy P&T committee.

While I see many positives to the proposed realignment, I find one component very troubling--the proposed move of Biology to the College of Agriculture and Life Sciences. Biology would be a pillar of the proposed College of Arts and Sciences. Many within my own department (Psychological and Brain Sciences) have over-lapping research interests with those in Biology. Indeed, some (such as myself) could easily be housed in either Psychology or Biology. Of particular import here is our Neuroscience program, which builds upon strengths in the Biology and Psychology departments. Neuroscience is a stronger tie for many of us than our current home department. As an example, our departments have built strength in the area of spinal cord injury. Add to this clocks, neurobiology of memory, and cognitive neuroscience. At the very least, if some of Biology is asked to move to Agriculture, I hope that the University would consider forming an independent Department of Neuroscience within the new College of Arts and Sciences, bringing together core faculty from Psychology and Biology. The new program would fit well with the rapidly developing undergraduate major in Neuroscience (hosted by Biology and Psychology) and our very successful graduate program (TAMIN). The program would unite many of our top-funded researchers, building synergy that would fuel additional support and recognition. Such a model was adopted perhaps a decade ago by UT (see <https://neuroscience.utexas.edu>) and has been very successful there and at other institutions. In considering realignments, it has always seemed odd that Chemistry and BioBio are housed in separate colleges. When the re-alignment was announced, I thought that the administration would use this as an opportunity to fix this anomaly--moving Biochemistry to the College of Arts and Sciences. Closer ties with Chemistry would build strength and simplify/consolidate training options. A similar argument could be made for moving portions of Microbiology to Biology.

---

I am very supportive of moving HLKN into the School of Public Health. I am less supportive of moving the libraries under Arts and Sciences. I am very supportive of the creation of a College of Arts and Sciences.

---

Statements concerning the Department of Biology in the MGT report are flawed. Undergraduates that are interested in obtaining a Bachelor in biology, neuroscience, microbiology and zoology are best served by the research active faculty of the Department of Biology, housed in a College of Arts and Science. A partnership that successfully works in many large prestigious universities in the country. The MGT consulting firm obtained a skewed perspective from a small number of self-serving individuals, associated with the College of Agriculture and Life Science and related units, which have conflicted interests in securing revenue associated with the Department of Biology's undergraduate teaching mission. The Faculty of the Department of Biology have demonstrated research excellence by having two Searle Scholars, Presidential Early Career Awardees and the TAMU's first Howard Hughes Medical Investigator on faculty. In addition the Department's majors (biology, neuroscience, microbiology and zoology) has an all-time low DFQW rate of 11.2%, a 96% first year retention rate, a +41% increase in BS/Bas awarded, a 12% increase in majors (over the university as whole) with a 56% representation of underrepresented minorities then TAMU (42%). The faculty as a whole is able to do this while also currently generating \$ 21 million in external research funding. Handing over this large operation to COALs, which does not contain any individual units that have demonstrated success in managing multiple responsibilities at the scale of the Department of Biology, is premature.

---

This section did not make a lot of sense. If you move the Department of Biology out of the newly created College of Arts and Sciences, it will not be a big college, and it will lose a big source of internal and external funding.

---

Recommendation #5: Create the new Institute of Biological Life Sciences which will contain the Department of Biology and the Biomedical Sciences Program. Faculty Feedback: The program of Biomedical Science (BIMS) is unrelated to the biology program. In fact, the only thing they have in common is the bio part of their names. I've had the opportunity to work as an instructor for both the biology and biomedical science programs, and I can clearly see the differences. By combining these two programs, students and anyone else involved in these programs face even more confusion and anxiety. The biology program is more science-based, and the learning outcomes differ from similar courses on BIMS, which primarily apply science in various areas. For example, based on the course that I taught, I can tell you that the genetics or microbiology that is being considered in biology is not the same as BIMS. While the concepts are similar, the learning outcomes are not. BIMS courses primarily prepare you for professional school. By listing the programs in the new Institute, students become more confused about which courses are appropriate for them and will prepare them for the future. Because BIMS was founded with the right college and the right mission, the program has grown to be one of the largest and most successful programs at TAMU. By relocating the program, you are removing it from its nurturing environment, where it has thrived and been successful.

---

Recommendation #6 to move the University Libraries as a department under the proposed College of Arts & Sciences needs further study. The proposed structure does not align with our peer institutions and seems counterintuitive based on the findings of the report. Not clear if the proposed Department of Library Sciences is to be degree granting for the

terminal masters in Library Science in addition to providing for-credit courses for primarily undergraduate programs. Do not see the human health or veterinary medicine professional programs (COM, COP, CVMBS) included in the rationale or recommendations for the Libraries which excludes a significant population. Recommendation for the leadership title for the Libraries does not follow the data presented in the Appendix detailing other land grant universities. Most university libraries report to the Provost with the most senior administrator holding titles including Dean, Vice Provost, Associate Provost, Sr. Vice Provost, etc.

---

A realignment and additional funding to update the equipment for viz does make sense. The combination of the Liberal Arts and Sciences, plus the addition of the library does not make sense. The library is the one truly central entity on this campus. This report is all about centralization, but the library will be siloed. The library budget under one college is a dangerous idea as the library budget now answers to one group and budgetary items may be distributed in ways that do not benefit all of the colleges. This is not how libraries are organized in the rest of the profession and it is not leading the way for a new way to organize libraries. This siloing will have consequences as will putting the promotion and tenure of librarians under a different college who might not necessarily understand the intricacies of a librarian's job. Librarians do teach on a daily basis. We are faculty, but just because a librarian doesn't look like faculty teaching a minimum number of credit hours does not mean we teach any less. Information literacy is important and is a major part of what we do in teaching as guests in other classes and in our involvement with other programs. It is essential to student success. A B.A. in library or information science is not useful. It is unethical to offer this as an option for students as the masters in the terminal degree for librarians. There are very few people enrolled in a PhD program in library science. Even if courses are created related to creation of a program or information literacy, someone still has to do the everyday job that librarians do on this campus to assist our students and contribute to their success. If a reorganization of the library is something the administration wants to look at, that needs to be done by consultants who are experts in libraries and understand the role and responsibilities of a university library to ensure student success and the ability to hire and retain talented faculty.

---

I am under the impression that I am among few faculty in CLLA and the College of Science who is supportive of the idea of merging the three colleges named in the report. I believe the values in all three units are aligned around basic research and fundamentals of the discipline. Joining the colleges could provide further opportunities for collaboration. With the extreme growth in the College of Engineering, the the new College's size might also be instrumental in achieving educational objectives. I am concerned about the misunderstanding of Performance Studies as a discipline. Has the coordinating board changed their position on redundancy in academic disciplines across the state? If we are encouraged to develop more in the areas of the visual and performing arts that would indeed be of benefit to our students. But if the coordinating board does not support duplication of educational efforts, developing in this area might be an unnecessary drain on resources. If we have the support of the state, bringing the visualization lab, art history (which is currently in Architecture, I believe, and struggling there), and dance into a College of Arts and Sciences would be a huge benefit to both students and faculty. A department of Journalism would be an excellent addition to the College should such a duplication be acceptable to the coordinating board. Political Science is a crucial component of a CofA&S. It is and has been one of the strongest departments in CLLA, moving to the Bush School might compromise the integrity of this research unity.

---

I do not object on the face to creating a new College of Liberal Arts & Sciences, though again, the rationale for doing so could be better supported. It's not clear that mere numbers of students and departments will put this new college on equal footing with the colleges that have associated extensions and "super deans." Moreover, the argument that other institutions use this model is not compelling. Are these institutions satisfied with the model of Arts & Science colleges--were they intentionally created ---or did their colleges simply come into existence because of institutional history? As with all units, the success of such a large college with diverse teaching, research, and service requirements will require strong leadership. Another concern is the see-sawing recommendations. PERF courses have been recently created from courses formerly labeled with other prefixes, and now the mandate is to create new departments. No mention was made of the recent changes -- what has changed to compel the realignment? Likewise, TAMU once had a major in journalism, which was eliminated. No mention is made of the previous major and why it was eliminated and why the situation has changed to once again make a journalism department and majors viable. As an aside, a major in print journalism does not seem forward thinking.

---

Under academic realignment, the College of Geosciences was recommended to merge with the College of Science and Liberal Art. However, it should be noted that a Geo/Earth Science themed College provides exceptional value in responding to many funding agencies' initiatives to tackle pressing challenges spanning from climate change to

environmental health. As a former graduate student, the fact that a College devoted to Earth System Science was one of the aspects that attracted me to select the offer from TAMU. As a former faculty candidate, the College of Geosciences was a major factor for me to accept the offer from TAMU. Geosciences is a unique discipline with many faculty members who are field-going scientists. The level of support and understanding of fieldwork from the College of Geosciences is unique. Field-going scientists face unique IT challenges because we would not have IT support while we are in the ocean open or somewhere in the remote Arctic or Antarctica. The flexibility in terms of teaching and service arrangements when faculty members have ongoing fieldwork stemmed from the deep understanding from the administrative level, which can only be found in a Geosciences College. Additionally, many agencies, such as NSF and DOE, how to have very specific initiatives that are Geosciences focused, which made our College uniquely positioned to target those funding opportunities as a College.

---

I have strong concerns about Recommendation 1, forming a College of Arts and Sciences. Teaching labs and the funding and infrastructure needs for experimental natural science is very different from needs in liberal and performing arts. I agree with the need for strengthening arts, humanities and social sciences, but not at the expense of science. Second layer administration for different units would be needed and I don't see cost savings, just a higher level of bureaucracy. What sort of person would be Dean? Would need to understand the academic and research enterprise in a number of different fields. Recommendation 2 Will this divert resources from other needs? Can A&M be all things or is focus and choices needed? Recommendation 3 I agree with the need for a Department of Journalism, with emphasis on digital. Recommendation 4 I don't know enough about Bush School to judge, but I have concern about damaging something that is currently performing very well Recommendation 5 I am strongly opposed. The Department of Biology has made recent advancements. It interacts with and has similar needs as other departments in the College of Science. I see no reason for the BIMS curriculum and degree. Eliminate BIMS and strengthen premed advising in the Department of Biology. I agree with a general biology first-year curriculum but this can be done within the Biology Dept. Recommendation 6. I see no rationale for a Department of Library Sciences. Recommendation 9c I agree with focusing College of Architecture on a core mission. Recommendation 9d I agree with the proposed changes in the College of Education and its refocus on teacher preparation.

---

As an institution of higher education we teach our students critical thinking and to evaluate facts in assessing a problem. Consequently, I was astonished to read the MTG report that included "facts" stated with no supporting evidence and other statements that were actually not correct. For example, "Most peer institutions do not have a stand-alone biology department," is not at all the case. Biology is a fundamental science and is an important component of the College of SCIENCE. Why does the report not focus on building the strengths of the university instead of diluting strong departments? The document also suggests that lumping the Colleges of Liberal Arts, Science and Geosciences, will create a large unit on the scale of Engineering. But is there any evidence that such a merger will increase TAMU's research dollars or stature? No evidence was provided. Yes, it will reduce some administrative costs (is this the primary and the ONLY reason for this realignment?), but will the savings outweigh the potential losses? Given the goal for departments to grow and increase the number of research grants obtained, if they are merged into a single large unit, the support for an individual faculty member (a seemingly high priority in the Report) will certainly decline. For the College of Geosciences, it seems that a number of issues could actually decrease the success in obtaining research grants and in recruiting faculty and students. TAMU is noteworthy for having a College of Geosciences, and awards, such as the IODP, are made based on the reputation of the College. Our faculty are involved in extensive field work, which may not be fully appreciated in a large College where most research is lab based, resulting in fewer opportunities for students and faculty. This merger could also result in more difficulty in recruiting excellent new faculty and for those new faculty to obtain research grants. In a recent report, it was noted that funding for Geosciences has been increasing (Status of the Geoscience Workforce 2018) so it seems that cutting our advantage in obtaining those funds would not be beneficial to TAMU. Another potential outcome it a mass exodus of our current highly productive faculty who will leave to join Geoscience institutes or colleges at other universities.

---

I will keep my comments specific to the College of Education and Human Development (CEHD) given that is my home College. First, regarding the consolidation of the Department of Health & Kinesiology (HLKN) into the School of Public Health (SPH). Realignment has been discussed many times during my career here. These conversations have lasted at least 4 Provosts and multiple Presidents. PULL THE TRIGGER ALREADY. MAKE THE CHANGE. Having this issue continuously hanging over our heads is frustrating and fosters low-level anxiety over "will they won't they?" To address this issue, I see two options: (1) move the Health Education Division (n=22) out of HLKN and into the Health Promotion Community Health Sciences (HLCHS) Department in SPH; OR (2) Move HPCHS (n=9) into the Health Education Division of

HLKN. Note: roughly one third of the current faculty of HPCHS were former HLKN faculty members. That department was originally founded and populated by former HLKN faculty. Thus, I see these faculty being able to easily pivot and accept either of these options. Second, should you decide to remove the Health Education Division from HLKN, you will be left with multiple other units that need to be addressed. These other units in HLKN include Sport Management, Kinesiology, and the Physical Education Activity Program. Where will these units go? Will they simply stay together in CEHD? Or, will they go to SPH? Or will they be broken up and spread across campus? Given moving Health Education into SPH will result in other downstream implications for other programs/divisions, perhaps it makes sense for HLKN to absorb HPCHS. Third, the report makes it clear the university is going to very large Colleges. If you makes changes to HLKN, CEHD will be significantly diminished in size. HLKN represents roughly 60% of CEHD. Thus, if you remove the Health Education Division (largest unit in HLKN) from HLKN, or the entire HLKN department from CEHD, the college will be significantly reduced in size. That begs the question, why would be keep the College of Education in place when it will be absolutely tiny in comparison to the other units on campus?

---

Needs further study.

---

In principle, the combination of some existing colleges into larger academic units is not problematic. However, it is important that the consolidation should not be used as a pretense to diminish the university's commitment to research, teaching, and service activities within its various academic disciplines.

---

This is long overdue, particularly for the biological and life sciences. There has been tremendous function creep and overlap across 3 colleges. No doubt leads to confusion to students and has clearly lead to tuff battles with departments blocking courses even if only peripherally related to current offerings. The move of part of HKLN to public health is particularly odd as much of that research is more closely aligned with what is occurring in COALS (ex is the exercise research is directly complementary to that occurring in nutrition and the human clinical research facility has primarily run nutrition studies). This is mostly focused on individuals, not populations that public health focuses on. The formation of an institute for biological sciences is hard to envision. The better model is likely that at Ohio State that has a Depart of Life Science Education for the first year program before students migrate into a defined major. Departments that evolve should require those that will produce the biggest external impact/stature nationally. It wasn't clear what happens to faculty that primarily teach in BIMS when the BIMS program moves to COALS. Is the recommendation that they move as well like faculty in biology?

---

Merging the Bush School with political science is a bad idea that reinforces my overall assessment of consulting firms. I say that as someone who was in political science for twenty years before moving my tenure to the Bush School in 2001. The two organizations have different cultures that would be hard to reconcile. The Bush School places much greater emphasis on applied research and instruction that is of practical relevance to public servants. Relatedly, it values the contributions that non-tenure-track practitioners can make to its educational mission to a much greater extent than would be the case with our political science department. These differences could pose important challenges in terms of curriculum design and the evaluation of faculty, among other things. I would be curious to know about the sources and reasoning behind this recommendation. There are schools of public affairs that offer undergraduate degrees and PhDs, but the good ones I am familiar with are divorced from political science. Bill West

---

I am strongly in favor of raising the profile of the arts on campus by creating a School of Fine Arts. Placing the School with a College of Arts and Sciences would better position artist and historians of art to work with others in the humanities and creative fields and serve the student body as advisors on related research, from the undergraduate level to PhD candidates. In particular, art historians in Visualization would be better-positioned to develop a curriculum in keeping with the rapidly growing fields of art/science and material studies.

---

Moving the biology department to agrilife doesn't make sense to me. The rationale in the document isn't strong (and doesn't mention why it should be done at all, in my opinion). As well, this means that premed students, for instance, are in the agriculture school. Of all the major proposed changes, this is the one that makes the least sense.

---

My main concern about this new College of Arts and Sciences would be the sheer size of it and the fact that this proposal seems a bit of a hodge podge. Granted, many other institutions use this model, but what are their sizes? TAMU is an extremely LARGE institution with a large number of students. And given that traditionally arts, humanities, and social sciences are usually underfunded - I'm afraid that this might end up killing off a number of programs. That said, I completely agree that we need a more active and robust arts' programs. Studies have shown that a liberal/creative arts education results in students truly becoming scholars and are able to engage in critical thinking, and to be more creative problem solvers. This would also feed into more community engagement and providing more culture for

faculty/staff/community. Wasn't there a department of Journalism that was disbanded not that long ago? Out of curiosity, how does the agreement between TAMU and the late President H.W. Bush impact Recommendation #4? And does the Dept of Political Science not serve a different purpose? Recommendation #5 - I'm not really qualified to discuss, but it seems to me that this institute could easily become a mess if not carefully planned for. Which means doing a much more in-depth examination than reported here. Recommendation #6 - This report does not appear to understand the functions of an academic library, much less what its librarians actually do, nor what is involved in the creation of a library science program! 1) Where would the actual day to day operations happen? Or is the proposal to get rid of the functioning library? 2) Foundation funds designated for purchasing books/materials through the library would then be funnelled through this new Dean of Arts and Sciences. I can see donor's having a very large issue with this. 3) As would other colleges. What happens if the dean of Arts and Sciences decides that he doesn't like the Dean of Engineering? What happens to the monies designated for those materials? Or - and even more likely scenario - that there are budget cuts and it's decided that we need to keep the Ebsco databases (because they understand WHY those are important to their faculty and students) and get rid of the Elsevier resources (who actually owns the copyright to the published research generated by faculty who have to publish in their peer-reviewed journals in order to get tenure) which the STEM faculty rely on, simply because of the cost. 4) Why is the University Press not mentioned? This is vitally important - especially since one of the main reasons journal publications and databases are in for-profit hands is because in the 80's it was decided that private industry is more efficient than public and universities started selling their titles to companies like Elsevier! Want to REALLY cut costs? Build the university presses back up as centers of scholarly publishing! 5) Professional librarians have terminal degrees and are scholar-practitioners. Librarians have always been an integral part of education, since the founding of the University of Bologna in 1088. In western history, most early medieval universities were founded at a given location because of the library! Librarians are generalists more than specialist, however in order to do our jobs - we have to have in-depth knowledge of pretty much every subject in order to be able to direct students to needed resources. 6) Many students use the library without even realize they are doing so whenever they access materials through the catalog, the myriad of databases purchased and maintained by the library, our institutional repositories, etc. 7) It takes a high level of skill, knowledge and frankly experience to ensure that students, faculty and staff can access the resources they need. Much less deal with the changing metadata and technology standards, such as understanding linked data and vital it is. 8) How would putting the university library in one college affect the ability of other colleges departments and units from getting accreditation - much less the university itself? 9) One department is NOT going to be able to teach students in each major what they need to know with regards to information literacy, due to the fact that each major - each type of knowledge - has different needs and needs different skill sets! All a department can really do - and we do it through our Hullabaloo courses - it teach general, basic information literacy. And I won't deny that it probably doesn't go far enough and the need for information literacy is great - not just among students, but also some faculty and staff. 10) Nothing is discussed about the practical day-to-day operations of running a library. How will materials be ordered? How will they be cataloged, recorded? How will we know what is needed? Things shelved? 11) there are already 4 library programs of which 3 are ALA accredited in the state. There are a total of 67 accredited programs in the US and Canada. Frankly, Texas doesn't need another one to compete within the state. 11) Oh - and BTW - the Bush Library is under the National Archives. We have NO CONTROL over it. In short - Recommendation #6 just doesn't make sense as a department out of the College of Arts and Sciences. Recommendation #7 - I don't feel qualified to comment on this one. Recommendation #8 - OK - we'll have a new Institute of Biosciences and Technology and now we're also including research at TAMU-Health? Seems like it would still be bogged down. Recommendation #9 - I think this would lose us students, not help with recruitment. Basically, it sends the message of 'we only care about research - not teaching the students'. Bad PR. In all of them. This needs to be re-thought. Badly. Especially assigning all undergraduates to the college of arts and sciences. And the refocusing - well, what will we be losing by doing this?

---

I like to propose a new Institute of Computing, Machine Learning and Data Science which will contain: Computer Science, Computer Engineering, Statistics, visualization, department of information and operation management. moreover, a part of Maths and Industrial engineering can create a new department Mathematical and computational Data Science. This can belong to both College of Engineering and college of science or in college of engineering with close connection with COS. This is very much needed due to a huge demand from government, industry to get next generation Data Scientist. Also there are call for multi million dollars proposals from both NSF and NIH. it will work directly with college of medicine to develop training and research and research programs on AI based medicine. More details can be provided if you consider it for next stage.

I do not think academic realignment has any value. One could work towards having more interdisciplinary research etc., but rearranging colleges seems to be too much and inefficient, see my comment on Faculty Affairs.

---

I support the merger of various colleges into a college of arts and sciences. But as the saying goes, the devil is in the details. How this merger happens, who the leadership team is, and what kind of administrative structure is put in place will determine the success of such a merger. I do not believe there is anything magical about moving the humanities in with the STEM fields that will elevate the humanities. It could bury them. Supporting and valuing humanities for WHAT HUMANITIES DO will determine the future of the humanities here. Following Humboldt's model of the university, the humanities must be allowed to do their job, to offer critique, to read texts closely and to teach our students to read carefully and to think creatively and to write powerfully. But humanities research must be valued. I do not mean to suggest that the humanities do not have applied value--I run the K-12 philosophy program, which includes a one week philosophy summer camp. That has been a powerful experience for faculty, graduate students, undergraduates, and middle/high school student. And it has, I believe, created enormous good will toward the discipline of philosophy--we've influenced a bunch of young people to pursue philosophy (as a major, minor, or just intellectual interest) in college. Here is what I would suggest however--in addition to these large academic alignment moves, why not also offer a window for individual faculty realignment. Many faculty outgrow their departments and their disciplines--why not allow for a repositioning and movement for faculty --from dept to dept or even to move to another college, without penalty to the receiving unit (that is without preventing them from other new hires in the near future if they accept colleagues from within TAMU into their unit. Many toxic situations in depts actually arise from these disciplinary changes--so this could help climate within depts. Finally, with regard to the merger itself--what will this look like--there are awards that are currently college specific. How will those awards be defined, especially when some depts might consider redefining themselves. For example, I could imagine psychology wanting to be identified as a STEM field--as a science. Would this mean that their newly tenured faculty are not eligible for the Rothrock? This is the kind of consideration that needs to be thought through carefully.

---

I am concerned about the recommendation for the University Libraries. It looks like MGT mostly relied on a 2008 report rather than looking in depth at peer institutions. First I disagree with moving the libraries into the proposed College of Arts and Sciences. This will make the University Libraries appear as if they serve this college alone, and not all colleges across campus. The Libraries are a cultural place, we are very imbedded in processes throughout many colleges and departments. As for creating a Department of Library Sciences, this would require new faculty. The duties of the librarians who work in the University Libraries keep the library running. Our workloads are such that we do not have the capacity to ensure faculty, staff, and students have access to information sources and training to use these resources as well as teach credit courses. From the perspective of other colleges, many colleges have full curricular degree plans that would not allow the addition of 'library for credit' courses. Librarians function within these colleges and their courses by providing course specific instruction and opportunities outside of regular coursework in the form of workshops to meet the educational needs of students that fall outside of credit courses to ensure student success. Librarians provide active curation that requires faculty expertise, and to speak the language of faculty in other colleges while liaising with them. Information literacy is constructed and contextual within the norms of the disciplines in which the researcher/learner is working. It is difficult to divorce information literacy from the context in which the information is created, sought, and used. Therefore, the embedded nature of librarians within the whole of the university curriculum, across departments and units, is mission critical to student success. Information literacy also happens outside of the classroom in the experience of doing research and using the libraries as the campus hub of information access and the associated collections, programs, and initiatives. Moving the libraries exclusively into the classroom experience without acknowledging all of the co-curricular ways in which library services support the whole learning experience is misguided. This past year the Libraries have been working on a strategic plan to address library spaces to address the Learning Commons suggestion. I do not believe the consultants did not do a thorough assessment of the Libraries and I suggest that the Libraries be allowed to do an internal assessment to address the issues raised by the consultants and provide a more accurate presentation of the central role the Libraries play on campus and how Librarians work to support that role.

---

Creation of the New Institute of Biological Life Sciences might afford some synergies at first glance, but has the potential to negatively impact preparation as well as potential recruitment of students for our professional programs in medicine and veterinary medicine.

---

I support the merger of the colleges to create a college of arts and sciences. In particular, the proposed school of performing arts is long overdue, as is the creation of an independent Dept of Journalism. Enthusiasm is less for the

proposed changes to the Bush school. Its distance from the main campus puts it out of reach of the undergraduate population, and there is insufficient parking to accommodate undergraduate commuters shuttling between there and the main campus. Perhaps the most important recommendation is the newly proposed institute of Biological Sciences to be shifted to Agrilife. While the report considers existing Departments in Biomedical Sciences, Ecology and Conservation Biology and Biology, no mention is made of Interdisciplinary degree programs in Ecology and Evolutionary Biology or Genetics and Genomics. Were such an Institute to be constructed, the fate of these programs would have to be addressed. The recommendations regarding library sciences make it unclear how incorporating all libraries into a single college would be able to effectively serve disciplines in other colleges. I support efforts to refocus the college of veterinary medicine, the changes proposed are logical. However, the need for a new small animal hospital is not clear as the existing space is relatively new.

Before implementing the transition of moving programs out of the College/units and consolidating into larger groups, the upper administration needs to clarify who will oversee this transition for each unit, then allow these people to meet with faculty to hear their concerns and allow their creative input into the organization of the program. The BIMS major needs to move to an all-encompassing life sciences program that students can transfer into when their earlier coursework indicates that they can succeed in this program, not before. The administration and older faculty within the College of Vet Med will not like this, but it needs to happen. The university, in general, needs to evaluate the need for non-thesis Masters's programs. It is not easy to see what societal value these programs have outside of generating money, which is offset by the significant impact on student debt.

The Department of Visualization is home to artists, designers, historians (humanists), computer graphics researchers and human-computer interaction researchers. The multidisciplinary of the faculty is what makes the interdisciplinary nature of the curriculum so effective. If the artists and designers are moved to a Department of Art & Design, then next will be the historians moved to their own department and the computer scientists and HCI scientists moved to Engineering. What will be left? Not the same department and programs that the report says should receive support and the opportunity to grow. Use Visualization as a model for how STEAM works. Magnify what it can do for its field and its structure as a way to amplify what's possible in others.

It is not clear in the report what is actually being proposed but I can see the value of the change. The key will be in the execution towards the goal.

Dear President Banks, I hope you are doing well! Over this past week I have had substantial discussions with colleagues within and outside the Department of Health & Kinesiology. I thoroughly examined the MGT report and its recommendations with particular attention to the report's analysis, data, claims, and rationale. I considered best fit, academic health, Land/Sea/Space Grant mission, our undergraduate and graduate students, as well as faculty in formulating a set of sound recommendations and suggestions. Importantly, I am addressing misleading information and erroneous assumptions within the MTG report that have muddled the role of Kinesiology at Texas A&M and best fit. Please find below my rationale for placement of a new Department of Kinesiology within the new academic framework proposed by MTG. I strongly applaud distillation of colleges to 4 academic units (AgriLife, Arts & Sciences, Engineering, TAMU Health) and reorganization of our current administrative behemoth of 16 colleges down to 4 academic units: AgriLife, Engineering, Arts and Sciences, and Texas A&M Health. At Duke, UNC, and many other AAU Tier One institutions mega-colleges of Arts & Sciences (e.g., Trinity College), Engineering, and Health or Health Science are quite common. An AgriLife College or academic unit is also common as you know in many Land Grant Universities, including Cornell.

A. Background and Rationale: The Kinesiology Division within the Department of Health & Kinesiology is a group of integrated physiologists and neuroscientists who examine the biology and pathology involved in physical activity, sedentary lifestyle, disuse, metabolism and the impact on fitness, neuromuscular diseases, spaceflight, cardiovascular disease, lifespan challenges, etc. Our research has been externally funded by NIH, NASA, DOD, NSF, American Health Association, Muscular Dystrophy Association, American Lung Association, the American College of Sports Medicine, and numerous foundations and private industry.

- The Kinesiology Division is unique and does not overlap with Community Health, Public Health, and Allied Health who do not collect experimental data and are policy driven.
- Kinesiology Faculty fit particularly well with the Land/Space/Sea Grant mission of Texas A&M University and focus on new knowledge and dissemination of that new knowledge in applied sciences. Our Best fit = AgriLife
- The Kinesiology Division has over 1200 students including 100 graduate students. Our goal is to increase the graduate/undergraduate ratio as the reorganization process continues.
- The Kinesiology Division was not a good fit within the College of Education and Human Development as we were experimental data driven. Thus, reorganization away from this model is welcomed.
- The Physical Education Activity Program (PEAP) and Huffines Institute of Sports

Medicine are the Extension Limb of Kinesiology and historically part of the Kinesiology Division. Both should continue to be integrated into Kinesiology • Community Health would be a far better fit for the School of Public Health. There is considerable program overlap and collaboration. Allied Health arguably could migrate to Public Health or remain within a Kinesiology departmental framework. However, Kinesiology faculty collect their own laboratory generated data instead of accessing data bases or focusing on surveys. • Kinesiology faculty currently do not collaborate with public health faculty. Instead, we collaborate with faculty in the - Department of Nutrition (many Kinesiology Faculty are currently Graduate Faculty of Nutrition) - Department of Animal Science - Neuromuscular Disease faculty within the Integrative Life Science Building - Department of Biochemistry & Biophysics - Department of Psychology - Department of Veterinary Physiology & Pharmacology • Kinesiology faculty focus integrative on cell line, animal, and human data collection within a laboratory environment, well-suited for AgriLife. • The Human Clinical Research Facility (HCRF) has been serving core and health needs, but is not openly available to the Faculty of Kinesiology, but on a pay basis. Their mission of Clinical Research Aligns with TAMU Health • Many of the parallels mention for fit of Kinesiology within TAMU Health have mistakes or have misconstrued information. Some of the information cited were not peer institutions. Most “Colleges of Health” that include Kinesiology do not contain either Public Health and/or a School of Medicine. Some include Nutrition and/or Physical Therapy. Examples cited below are NOT congruent with TAMU Health proposed and have been misrepresented as including or focusing upon Public Health: • Oregon State University, College of Public Health and Human Sciences, School of Biological and Population Health Sciences. Our Department + Nutrition = Stand Alone College • University of Illinois, College of Applied Health Sciences, Kinesiology and Community Health (There is no public health degree that I can find at this University) Thus, University of Illinois’ College of Applied Life Sciences is our current Department Health & Kinesiology as a stand alone college • University of Utah, College of Health, Department of Health and Kinesiology (no public health listed at all in this college) Includes Physical Therapy and recently included Nutrition • Central Oklahoma, College of Education and Professional Studies, Department of Kinesiology and Health Studies. Not a peer institution. Stand-alone College = Our Department, but not Medicine, Public Health • Iowa State University, College of Human Sciences, Dept of Kinesiology and Health. Stand-alone College = Our Department but not Medicine, Public Health • Miami University, College of Education, Health and Society, Department of Kinesiology, Nutrition, and Health College = Nutrition + our Department • University of Nebraska at Omaha, College of Education, Health, and Human Sciences, School of Health and Kinesiology (graduate degrees in public health are not allowed at this institution as the medical school offers the grad degrees) Not a peer institution • University of North Dakota, College of Education and Human Development, Department of Education, Health, & Behavior Studies (note their degree here is a BS in public health education) Not a peer institution. • The best fit for Kinesiology at Texas A&M University based upon the above background and rationale is an AgriLife models, for example within the University of Missouri and Virginia Tech. Indeed, Kinesiology programs are now integrated with Nutrition at those institutions and are well-funded by NIH. B. Recommendations for Reorganization based upon - Best Fit within the new Academic Framework - Current Collaborators - Recent move and current location on West Campus near the AgriLife Building, Nutrition, Bio-Bio, ILSB, PEAP Building - The entirety of the MTG Report - Academic Health and Excellence 1. A new Department of Kinesiology would be placed within AgriLife - Resources would include the Gilchrist Building and laboratories, the PEAP Building, and Huffines Institute for Sports Medicine - PEAP would be folded into Kinesiology again and would be rebranded the Physical Activity Program - The Huffines Institute and PEAP would be our Extension Program and integrated into AgriLife’s Extension program and resources - The Department of Kinesiology would be positioned for greater integration with the Department of Nutrition and proposed Precision Medicine initiative. The University of Missouri has a similar model and a new laboratory institute completed this year. 2. Community Health, and possibly Allied Health, would migrate away from Gilchrist into TAMU Public Health and TAMU Health 3. HCRF would be housed within TAMU Health and Public Health as a clinical research wing. 4. Sport Management options include: - migration into Recreation Parks, and Tourism Science within AgriLife - integration into Mays School of Business

We do have diluted academic units, e.g., life sciences, and therefore the proposal to consolidate to strengthen units is a good one. This will improve rankings, resources, and student recruitment; many benefits. Many of the proposed realignments make sense.

I am concerned that moving the Department of Construction Science (COSC) to the College of Engineering will leave many students behind. This is assuming that COSC will need to meet Accreditation Board for Engineering and Technology (ABET) requirements. If that is the case, the department would be dissolved as it is now. With a degree in mechanical engineering, I appreciate the rigor and discipline it takes to earn a degree in engineering. As a member of the COSC faculty, I do not believe the current COSC student will fit into the College of Engineering. A COSC student is

extremely hard working, inquisitive, personable, and driven but does not possess the mathematical and quantitative skills needed in engineering. The COSC curriculum is more aligned with management than it is engineering. If COSC moves to engineering, and the current program is dissolved, many students will be out of place in a successful department.

If TAMU is moving to “super colleges” - very large colleges with many departments, it seems very odd to keep College of Architecture and Education. They will be dwarfed by the other units. For example, College of Education is currently the fourth largest unit at TAMU (largely due to HLKN). Removing HLKN will make College of Education the smallest or second smallest. And if TAMU is organized around 4 key pillars, education and architecture seems like outliers that need to be better incorporated into the fold.

Creation of a College of Arts and Sciences by merging Geoscience, Liberal Arts, and Science has its merits as summarized in the MGT report. However, to an undergraduate or graduate student it doesn't really matter. This merger will come with major challenges not least being the “shock” of combining three very different cultures. However, moving out of the Science cluster is problematic (see comments below)

I believe the Department of Construction Science needs to remain with the college of architecture because it is with Architects with the discipline where most builders interact the most, not engineers. I think a move to the COE may provide additional funds to the department and that's positive but the essence of the program would never be the same. The department would lose investments in time and money from most of their CIAC industry partners and with the engineering admission requirements, the cost of the education and the type of common classes as required by the COE, the department would not attract as many students or the type of student needed for the construction industry and there would be a significant loss in students in the program. The department is already the envy of similar departments and this move may potentially destroy it. I would like to know who benefits from this change and find other solutions to help them without affecting the already number 1 construction program in the country.

**THE FORMATION OF A COLLEGE OF ARTS AND SCIENCES** I am in favor of this reorganization for the reasons articulated in the report and based on experience with my alma mater, the University of Minnesota, which has this structure, as do many other top-tier public research universities. Although I have heard concerns from some in the humanities that such a move would diminish, in various ways, what they do, in fact the humanities is one of the top fields of the University of Minnesota internationally, so from experience and observation, these concerns do not hold up.

**JOURNALISM** Speaking as someone with a PhD from one of the top journalism schools in the country, the University of Minnesota, and who now sits in the department in which the current iteration of the journalism program is housed, it is clear that many new faculty would need to be hired if the Department of Journalism were to be recreated. We have superb faculty who can teach reporting, editing, and organizational matters such as how to get advertising to support a small local newspaper (the student newspaper), we do not any longer have faculty who can teach other key subjects such as journalism history, media economics, international and comparative journalism, and other subjects that are also extremely important for those earning a BA in this area. Communication law and policy is typically a required course in journalism; there is one faculty member teaching in this area now, but that faculty member is senior and there is no backup, so that would be another hire (or hires) that would be needed. None of the people teaching reporting currently have PhDs, so in my view none of them would have the preparation necessary to manage an academic department at a tier one research university -- a department head would have to be hired from outside as well. Whether or not the unit decides to go for accreditation (NOT necessary for students to get jobs, unlike the situation for library schools), teaching requirements such as the law course should be respected because long experience has made clear that those in journalism need this knowledge.

**INFORMATION SCIENCE** I can also speak as someone who first worked in a library school as an undergraduate in the 1970s, as a scholar has built a strong identity in the field of information science and is described as having defined the field of information policy, has been involved in programs bringing information science together with other fields at 3 research universities, designed and launched the first graduate information policy program on the African continent, and who served on the editorial board of the leading journal in information science, several comments on moving the libraries into a Library Department. If it were possible to have a unit focusing on information science, however titled, I personally would be extremely interested in joining that faculty. It is a serious lacuna in TAMU's curricular offerings and research profile not to have an information science unit that should ultimately offer a doctorate. I strongly support the creation of such a unit in general, although NOT in combination with the libraries, as proposed, and not with the unit name proposed. Further comments explicating the concerns: (1) **HEAD OF THE LIBRARIES IN THE ORGANIZATIONAL STRUCTURE:** The trend in recent decades has been for heads of libraries to move UP the administrative structure, often to the Vice President level and often merging the job with that of the Chief

Information Officer, as both positions have to do with how researchers and students can access, use, and disseminate information and research. Going counter to trend, moving that position down the administrative ladder will not serve either the curricular function or the libraries well, undermining the knowledge foundation of the entire university. This outcome is the opposite of what we are being told the report's recommendations are intended to achieve -- to ensure that TAMU can continue to hold its competitive position among tier one research universities within the US and internationally. (2) UNDERGRADUATE ATTRACTION TO "LIBRARY" COURSES: Undergraduate students, a high proportion of whom are never in the libraries unless for coffee and snacks, are not going to find their way to information science courses hidden under the label of a Library Department. (Graduate students will find their way to programs that combine librarianship with information science in their names and courses.) (3) NAMING THE UNIT: "Library" Having checked again with experts on libraries in the field of information science around the country since reading this report, it is still clear that the ONLY units currently using the word "library" at universities in the United States are those that are accredited with the American Library Association (ALA) and are preparing students for professional careers as librarians. "Information Science" I do understand that TAMU cannot use the term "information science" because Texas can only have two such units and there are already such units at UT-Austin and the University of North Texas. I don't know if that is negotiable in any way, but if it is, would encourage pursuing that. "iSchool" An alternative term that many schools have been using since the "iSchools" movement began in the mid-1990s, transforming traditional library schools into highly competitive research-intensive units with heavy external funding as disciplines around universities battled with each other over the intellectual and curricular turf generated by digitization. The iSchools association launched with heavy external research funding requirements for membership (now more relaxed) and achieved that research presence. The annual iSchools conference is the most research-intensive in the field of information science. However, TAMU already tried to independently redefine the term by using the "iSchools" name for something entirely other -- a School of Innovation. This move was not persuasive to others and made university administrators look, to say the least, ill-informed, in a very public manner. "Informatics" Indiana University -- where a library and information science person served for a long time as a dynamic head of the university -- introduced use of the term "informatics" to replace information science a couple of decades ago. In its current formulation, it includes a "Department of Informatics" in a School of Informatics, Computing, and Engineering (emphasis on electrical engineering there). This term could be used at TAMU, has none of the different types of problems associated with other names, and is the name I strongly recommend instead of "library."

IMPACT ON THE DEPARTMENT OF COMMUNICATION If all of the recommendations in the study are followed, the Department of Communication, would be, in essence, disembowelled. The creation of the Department of Journalism would remove all of the journalism faculty from the department. The new practicing arts configuration would move a number of other production faculty out of the department as well as, possibly, the faculty member with a particular research interest in gaming. A Department of Informatics would be very attractive to me. If any of these moves is further considered, the impact on the Department of Communication will need to be taken into account.

---

Consolidation of three Colleges into a proposed College of Arts and Sciences is justified primarily by the assertion that this is a successful model at peer institutions. However, very little data is actually provided to support this assertion. Faculty have very legitimate concerns about the impact of this on the tenure and promotion process, as it is unclear that T&P committees at the college level will be constructed to be familiar with the research, teaching and service activities of faculty in very diverse programs. The impact of this consolidation will likely have a profound effect on the ability of departments to recruit and retain faculty in core areas of excellence. For example, there is no doubt a shared vision for the future of geoscience disciplines in the current College of Geosciences. This is likely to be lost at the college level under the proposed model.

---

I am completely in favor of the realignment, with the caveat that it must be done well. A timeline of trying to do so by September does not give me confidence that it would be done according to a well thought out plan. Parts of the realignment are a bit non-sensical. I don't think putting Political Science in the Bush School would solve the problems the report thinks it would. Political Science and, for that matter, Economics are very theoretical disciplines. Departments advance in the rankings based on their contributions to their basic sciences. The Bush School is a very practically oriented school, dedicated to training practitioners. It would be a reputational drag on both of those departments and it would be a fundamental culture clash. Moreover, it would not increase the overall number of students served, but merely shift the accounting of them from one unit to another. The idea of putting International Studies in the Bush School has some merit and would much more likely increase the actual number of students served. International Studies students would flock to the DC center. Even that has some difficulties that would need to be overcome. I think moving

Kinesiology to Public Health is a good idea, but the College of Education has taken a big hit, without any requisite benefit. One thing that a reorganization might consider is moving all foreign language education into that college. It might then, for instance, increase the number of teachers being trained in Spanish dual language instruction. And it would give a home to the other foreign languages that would be displaced by a move by International Studies to the Bush School. I am not a big fan of the re-creation of the Department of Journalism, at least not under that name. It sounds very old-fashioned. But if it is done, then the Ag Journalism program must also be moved into it. The creation of a School of Visual and Performing Arts sounds like a pipe dream, but one I would gladly indulge. The centralizing of advising, business, and IT seem like really bad ideas. Advisers serve critical roles in departments and colleges. The bureaucratic task of changing majors can be simplified without removing the intellectual content that centralizing advising would effect. In some colleges it would also affect accreditation. If by centralizing one is merely suggesting where the staff lines are located in Workday, then fine. Centralizing business functions will prove itself quickly to be just as bad of an idea. Departments and Colleges would not have partners in strategic budgeting, daily business functioning, etc... This will become most visible the next time there is a major university budget crisis. It will be easier to draw money from units, but it will be harder for those units to maintain operations. Facilities management is one centralization idea that I think is workable and might result in a better use of facilities. In this one, however, Ag and Engineering should be included.

---

Efficiencies are always welcomed.

---

I am not in favor of putting the Bush School back together with the Political Science department for several reasons: 1. The Bush School is multidisciplinary, consisting mostly of economics and political science but also including history and regional studies. The Political Science is single discipline: political science only. There is as much rationale for integrating the Bush School with Economics as there for integrating it with Political Science. 2. The Bush School offers a graduate degree in international affairs with multiple courses in regional studies, international economics, international politics and so on; the Political Science department is heavily focused on US (domestic) politics. 3. The proposal ignores the history of the creation of the Bush School, which was carved out of the Public Administration program in the Political Science department in 1995 for which (as a quid pro quo for giving up the PA program), the department was able to grow its doctoral program. 4. The proposal also ignores the fact that the Bush School, the Political Science and the Economics department shared the Allen Building for nearly 25 years and the Political Science and Economics departments have just moved out to new spaces back on main campus. The costs involved in flip-flopping back and forth like this make no sense. 5. The proposal ignores the strong focus of the Bush School on national security agencies and intelligence, none of which exists in the Political Science department. 6. There are two other ways to grow the Bush School neither of which appear to have been considered by the committee. The first was to move the undergraduate program in International Studies (a very successful program) to the Bush School so that it could offer both undergraduate and graduate studies in international affairs. Related to this, if symmetry were important, it should be possible to develop a second undergraduate major program in Public Administration that could have been added to the Public Service and Administration program so both masters programs would have their own undergraduate programs. 7. The second way would be to consider adopting the framework in many other universities of having a graduate College that is policy based. In that college I would place (1) the Bush School, (2) the Law School and (3) the Mays Business School. All three programs primarily graduate masters students; Mays also multiple masters degrees in addition to its MBA program. Interestingly there is almost nothing in the report about the Mays Business School, which while larger than the Bush School is still smaller than most of the colleges. Pulling the three programs together in this manner would encourage the adoption of joint masters degree programs, something that is mostly missing now, such as a joint International Affairs and Law degree or a joint International Affairs and MBA degree.

---

Recommendation #9c: Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning is poorly thought out and will damage current departments and the College of Engineering (COE). The Department of Construction Science (COSC) is not an engineering degree nor ABET accredited and moving it to COE will degrade the College and the Department of Civil and Environmental Engineering. Graduates of the Department of Civil and Environmental Engineering will not support COSC being moved to the College and many will protest the idea of creating non-engineering programs within the College as industry expects us to graduate engineering-trained students.

---

My main comments relate to Finding #4 regarding the Bush School. Sudden expansion will undoubtedly negatively impact the culture so praised in the report. I agree that continued investment in the school makes sense including

expansion to undergraduate programs. However, the suggestion to suddenly bring in one huge department to the school, which would then dominate the finances and is totally out of sync with the culture, is concerning. In addition, by suggesting only political science be moved, it fails to recognize the importance of interdisciplinarity in the school; many (at least half) the Bush School faculty are not political scientists. The discussion about duplication of focus seems to not recognize what it is that we teach or do at the Bush School. It would be more sensible to move in multiple departments (as discussed in the Rationale) rather than just one. One possible model to alleviate tensions from bringing in large undergraduate programs to compete with the existing departments could be to offer the undergraduate degree programs collectively. Or allow time for the departments to develop their undergraduate programs prior to any mergers.

---

The proposed move of the Dept. of Health & Kinesiology to the School of Public Health would indeed solve the nagging issue of over-lapping UG health-related majors. Consultants and President Banks should be made aware that those major programs existed in HLKN decades before SPH developed their UG offerings. That aside, my major concern about moving HLKN lock-stock-and-barrel to SPH is the unprecedented challenge for SPH and the College of Medicine in managing UG programs involving over 3000 students and graduate programs with some hundreds of students who study in fields as disparate as sport management, physiology, and motor neuroscience, as well as the health-related majors. In addition, the Physical Education Activity Program is an entire division of HLKN currently; this is one of the best and largest programs of its sort in the country. Managing all this would be quite a break from traditional academic foci of colleges of medicine in the U.S. and, given the important charge of the COM to train graduate and medical students, this HLKN faculty member is quite concerned about the level of support these academic programs will enjoy (or not) from the SPH/COM. If an (unstated) motive behind this recommendation is to shift administration of the Human Clinical Research Facility (currently adlocked to HLKN and CEHD) to the College of Medicine, I strongly believe there are better options that can be discussed, given the challenges noted in the preceding paragraph. Notably, the HCRF deserves substantial financial support from central administration to make it more of a Core Facility benefiting all clinical researchers on campus. Offering subsidized services in this outstanding facility could prove a powerful recruiting tool to attract more clinical research faculty to A&M's College of Medicine and the School of Public Health, an explicit goal echoed within this consulting report.

---

There are profound and potentially transformational changes proposed, and I trust that those representing the other units will provide valuable input from their direct experience. My primary, overarching request for all of the proposed changes throughout the entire report is that all of the staff positions are protected regardless of the realignment or rearrangement of offices and functions. Please consider the contributions and service of the amazing staff at TAMU and ensure that those who are vulnerable know they are valued and respected. Thank you. The TAMU Libraries has been leading a state-wide effort to negotiate effective contracts with several major publishing companies, and I worry that demoting the enterprise to a single department will damage TAMU's reputation in this effort. Perhaps it is worth considering how the TAMU Libraries as a college-level unit could still deliver cutting-edge curricula and certifications (a recommendation I think is absolutely fantastic!), which would distinguish TAMU as a true leader among peers – best of both worlds! As [REDACTED], I see quite a bit of benefit to the potential creation of a College of Arts and Sciences. One immediate example is the idea of hosting the vast majority of the core curriculum in one college, with the potential to innovate in truly powerful ways while also leveraging the experiences that are uniquely TAMU (one of the guiding principles of this process). This recommendation does present one unintended and major challenge for TAMU, which is that the loss of the College of Geosciences will jeopardize the current, massive NSF contract for the International Ocean Discovery Program, and will severely jeopardize A&M's effort to successfully compete for the new and far bigger contract to host the next phase of US-led scientific ocean drilling post-2024. Since 1983, TAMU has served as the operator of the drilling vessel (the JOIDES Resolution) through a ~\$50million/year National Science Foundation contract. TAMU's deep commitment to the geosciences has empowered us to successfully recompetete for this contract in 2003 and 2012. The current contract ends in 2024 and another major recompetition will be conducted to host the next phase of the program. Major academic institutions with strong units of geosciences in New York, Oregon, Massachusetts, Rhode Island and California likely would compete for a renewal.

---

I am supportive of recommendation #1 - combining colleges to create a College of Arts and Sciences. I suspect there may be concerns with the establishment of a School of Visual and Performing Arts. However, entities of this recommendation could be adopted. I support the merger of the Bush School and Department of Political Science. I agree that there is duplication and a merger would strengthen TAMU in the political science arena. Combining the life sciences (i.e., biology and BIMS) into AgriLife is a good move; however, at TAMU academic programs are generally not a function of Institutes. There may be an opportunity to create a 'super' department or college-wide life science

program rather than creating a new Institute. By removing BIMS from CVM and focusing on graduate education, the core mission of CVM would be the primary focus. I support this change.

I am strongly opposing the merge of the college of science, college of geosciences, and college of liberal arts into the proposed college of liberal arts and science, and my reasons are as follows: 1. College of Geosciences at TAMU is a small (but very unique) and well recognized college with international reputation. The existence of this college, among other factors, making this college very competitive to win big science project constantly such as IODP (International Ocean Discovery Program) from National Science Foundation. If this college is merged, it is very likely we will lose our identity and lost the competitive edge in keeping IODP to TAMU campus. 2. I have talked with many students in my class and almost all of them thought this merge is a bad idea. Some students simply tell me that if the merge is going to happen, they have no choice but to transfer to a different university. They said the reason for them to choose TAMU College of Geosciences IS because of its uniqueness, reputation, and faculty's devotion to teaching, in particularly undergraduate education. If the college of geosciences becomes a small subunit in a big college of liberal arts and sciences, they will not be able to find the same kind of unique educational experience. 3. I have talked with many faculty members in our department and students in my class and found that most of them are unsupportive of the merge. The discussion of merge has caused a great degree of unnecessary anxiety among faculty and students who are already facing many challenges caused by COVID-19 and other issues. The timing of discussion of this merge is really bad, if not the worst.

My recommendation is that the University expand its Academic Realignment efforts to allow/encourage faculty members to transition from current appointments in departments/programs/colleges to new appointments in which their research and teaching are likely to be more effective and productive. Just as some units would be better off in different/expanded colleges, so would those faculty members whose research and teaching have evolved and those whose home departments/colleges no longer support their research and teaching efforts. I want to be clear: I'm not talking about an effort to reassign underproductive or uncooperative faculty members. I'm talking about reassigning faculty members who wish to become more productive, to serve more and better students, and to do more of the work they feel called to do. While I don't particularly care for the corporate model of university governance, the periodic re-assignment of employees--in this case faculty members--is well established as a practice conducive to enhanced productivity. Faculty members whose teaching and research expertise continues to grow should be allowed to outgrow the units to which they were originally assigned. Perhaps the University could create something like the Transfer Portal that was developed for those college athletes who seek a better/different environment in which to pursue their goals. The proposed academic realignment would get off to a terrific start if it also included the realignment of those reinvigorated faculty members who have been granted the opportunity to thrive in a new teaching/research environment. Thank you for your time.

The "Build your own Major" idea may well be a good addition. However, the current University Studies programs serve students who are looking for more guidance in their course of studies. This includes First Generation students.

██████████ I will comment about the proposed strengthening of the CEHD by focusing on education and re-alignment of KINE to TAM Health Science (SPH) and dance science into arts, sciences, and visualization. We have also heard there are some suggesting our sport management program would be better served in the college of business or management and our physical activity program would be better aligned to stay in the CEHD or align with recreation. Faculty have expressed interest in moving out of the CEHD since the 1990's. Our 2009 and 2015 external reviewers recommended the university seriously consider realignment. As of 2016 when I last examined placement of similar departments, only 25% of departments like HLKN remained aligned with education. Rationale for doing so included lack of administrative understanding and support from education focused deans, better alignment of academic programs, and providing stronger degree options for students who primarily pursue professional health degrees and/or health and science related careers. In 2015, the American Kinesiology Association (for which I'm a former board member) published a special issue in Kinesiology Review related to the integration and alignment of KINE with Public Health. In 2016, we began the process of considering a move. However, Provost Watson indicated she would not support making HLKN a school or college and that if we wanted to leave the CEHD we would have no input and may not like how we were split up across campus. As a result, our faculty who had completed a survey indicating 90% wanted to explore leaving the CEHD, decided it was better to stay in the CEHD rather than basically eliminate our department. Over the last 5 years, I believe our faculty hoped that the CEHD would provide more support. However, in my view, much of the gains we realized during my 9 years as DH have dwindled. We lost faculty, enrollment management policies resulted in a decrease in UG and graduate enrollment (and diversity), and we are no longer ranked as a top doctoral program by the National Academy of Kinesiology (apparently we didn't turn in data). Further, our only teacher education programs in

physical education and health education were terminated meaning there is even less in common with other departments within the CEHD. While I understand faculty will be apprehensive about realignment, in my view it is in our students and faculty's long-term benefit to move to Health Sciences, ideally as an independent department, or within arts and sciences. Nutrition would also benefit with merging into KINE. I for one, want to explore these options in an honest and open way as most of our top tiers are housed in colleges of human sciences, health sciences, public health, or are stand alone colleges. The report did not represent this well but its long time our programs, faculty, and students align with faculty and colleges that are closer to our disciplines.

---

I fully support the academic alignments proposed. It strikes me as odd, however, that TAMU would move to 4 main pillars and essential "super colleges", but retain the Colleges of Education and Architecture. For instance, removing the Department of Health & Kinesiology from the College of Education takes out more than 60% of the enrollment in that college.

---

I am very troubled by the proposed realignment of BIMS undergraduate. This is a highly successful program that is being moved around for unknown reasons. BIMS UG is not broken, why mess with it? What happens to BIMS graduate education? Where do faculty belong if not in an academic department home? How can building a small animal hospital (however much it is needed) be the focus of an academic college? This seems to be entirely inappropriate to me and is a University goal, not College. Aren't we here to teach?

---

I respectfully disagree with the assessment to consolidate HLKN under the SPH. Thanks!

---

Keeping the Colleges as they are provides a sane administrative structure. The people drawing up those fictitious organization charts undoubtedly had fun, but the proposed reorganization is madness. This is a large university, with many different programs requiring individual attention, not a small college where small programs can be lumped together.

---

The School of the Visual and Performing Arts is a long overdue need of the university. Currently the arts at TAMU are housed in three different colleges which does not encourage interdisciplinary or collaborations among faculty and students. Being housed under one umbrella (preferably in one location/building) will not only foster more collaboration between the art disciplines but will also give the arts a stronger voice on campus and within the community. With this realignment of the arts on campus, it is important that the dance program be able to maintain its focus on dance science as it is not only the first dance science focused program in the United States but is highly respected internationally. This degree is also reflective of the strengths which the university was founded. This new School being housed under a larger College of Arts and Sciences would compliment this degree. The arts being housed in a College of Arts and Sciences is common among many universities and would be a great fit for this new School.

---

I think the establishment of the new school is going to bring exciting changes. I strongly agree with many suggestions made in this report, especially the establishment of the school of visual and performing art. The relocation of visualization department for this new school seems timely and suitable to me, as the department indeed sits in the intersection of art and technology. In many other top universities (CMU, UCLA, Stanford, MIT) there are similar units that work in this intersection. The department has been providing fine art education, but just as the report suggested, is currently having restricted growth. As digital media becoming increasingly critical to almost every field, the establishment of the new school is certainly a great move to strengthen and multiply the impact that this program could have.

---

I have misgivings about merging the colleges of geosciences, sciences, and liberal arts. While the report notes that the majority of what the authors deem peer institutes do it this way, it is not clear that it would be right for TAMU. There is the example of Georgia Tech, which is arguably most like TAMU among US universities. They have a separate college of science. It would be good to talk to the heads of the various science departments at Ga Tech and see if they like their current structure and get their perspectives on the respective merits and possible downsides of the report's proposed merger. For my own part, I think TAMU, founded as an agricultural and mechanical school, has an historic mission in which there is a more than average weight given to the sciences and their applications. After the proposed merger, the math department would be less well placed to coordinate course offerings with the college of engineering. We might lose a lot of our bread-and-butter courses to courses taught within engineering.

---

Moving Department of Construction Science from the College of Architecture to the College of Engineering is rather intriguing. The rationale behind the proposed move is this department has more in common with the engineering disciplines than architecture. I agree that construction graduates are not architects, but they are not engineers either. Basically what they do in professional life is construction management. I think it would more sense if the Department of

The College of Veterinary MEDICINE should be aligned with the College of Medicine/Health Sciences Center rather than with College of Agriculture and Life Sciences. Medical principles and practice are the same for people and animals, and each provides insights for the other. Not only are each a model for advancement of medical knowledge to improve the health of people and other animals, but many diseases are shared between or common to humans and other animals. Thus, following the principle of "one medicine" would enhance the professional and graduate education at the medical and veterinary medical colleges and better promote collaborations and shared resources. It would also be beneficial to initiatives like medical engineering. I write this with utmost respect for colleagues in College of Agriculture and Life Sciences, and with the strong desire that health and life sciences be linked at Texas A&M University. But our university would be best served by the colleges of human and veterinary medicine being aligned to best improve the health and well-being of people and animals in Texas (and beyond).

Concerning recommendation #4: I think what MGT misses is that TAMU does not have a College of Social Sciences, and it should. As a result, many disparate things have been lumped into Liberal Arts—English and Economics, for goodness sakes! (And the MGT Recommendation #1 would worsen this, of course.) So the MGT firm cast their eyes around for some greater conceptual coherence for these disparate fields, and apparently came up with the notion of policy-relevance as a theme. So everything the MGT firm considered to be even somewhat involved in policy-relevant research, such as Econ and Poli Sci, and IS, would be put together under the entity that already has that theme—the Bush School. But that's a contorted response when a much simpler solution is called for: create a College of Social Sciences, under which Poli Sci and Econ and IS and Sociology and History and Psych would all belong. That's where coherence is to be found. The social sciences are far, far larger an enterprise than public policy. They are in the business of knowledge creation first and foremost—even if there is no immediate practical policy application for such knowledge. To try and have a policy school absorb social sciences is thus like having a gnat try to swallow a camel—the gnat will die and the camel will end up horribly mangled. It's really a completely backwards view of which is the larger, broader enterprise and which is the smaller, more focused enterprise. And realizing policy studies is a more focused enterprise is no doubt why the LBJ School is a separate entity in the UT system. The Elliott School of International Affairs is a separate entity in GW. SAIS at Johns Hopkins is a separate entity. Our top peer competitors have gotten where they are by being separate entities within their respective university systems, which allows them to focus in laser-like fashion on their educational mission. If the Bush School were to dilute its focus, it simply could not compete with its peers in the world of professional schools of public service and international affairs. Instead of being a rising star—which is what the Bush School is among its peers—we would no longer even be on the playing field. In addition, the quality of a graduate program is strongly linked to small class sizes. Under the MGT plan, small class sizes for Bush School MA students would of necessity disappear and our ranking among APSIA schools would plummet as a result. Finally, I wonder if President Bush made some stipulations about the nature of his School that still carry weight. President Bush was not in the business of broad social science undergraduate education. His mission was focused on preparing master's level students for direct entry into the world of public service. Surely that vision is still due respect at TAMU?

I write to caution that bringing the Department of Political Science into the Bush School is not the best way to achieve the important goal of growing the Bush School's presence and role on campus. The consultants exaggerated what they call "the significant overlap" and the "duplication of focus" between the School and Political Science. [REDACTED], I see very little overlap. When I came to the School eight years ago, I also thought that both programs could benefit from more interaction. I quickly learned that the missions of each are very different. Political Science prepares doctoral students for academic careers and teaches a large number of undergraduates, as majors and in the required courses in American government and Texas government for all undergraduates. Political Science's focus is disciplinary. The Bush School's focus is public service. Moreover, the two programs have developed very different academic foci. The Department of Public Service and Administration in the Bush School concentrates on the fields of public administration and public policy. Very few if any faculty in the Political Science Department focus on public administration. In the Department of International Affairs, our academic faculty focus on international relations and regional studies (Middle East, Latin America, East Asia, Europe). The Political Science Department has only a few international relations scholars and even fewer whose scholarly focus is world areas. In my eight years at the School, approving student degree plans in the International Affairs Department, I have seen precious few Bush School students take graduate courses in Political Science. They are more likely to take courses in Agricultural Economics, Nuclear Engineering and Geography. There are also very, very few Political Science graduate

students who take Bush School courses. That is not because it is bureaucratically hard to do so. It is because there is little overlap between what the Political Science students want and what the Bush School students want. The Bush School must expand into undergraduate education. I think that would best be done through the development of undergraduate majors in each of the Bush School departments. That might involve a new relationship with the Department of International Studies for my department, as mentioned in the report. The School is well positioned to make this change. Doing so would allow us to expand our role in the University while maintaining our distinctive public service mission. I fear that adding the Department of Political Science to the Bush School would dilute that distinctive mission.

---

Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. The rationale for that is stated as: "there should be significant cost savings by reducing three administrative college structures into one and using those funds to support the new College academic and research mission." We all know, that it does not work like that. What will happen is the creating one more administrative layer on TOP of the current ones. This increases the number of administrators per faculty. The rest of the rationale statement refers to a four-legged stool structure as if it can make any sense to anyone.

---

Where to start? The methods used to come to the conclusions in this report do not make any sense at all. I completed the survey. There were no questions about these realignments. The questions asked have nothing to do with the recommendations. Moving on, as I read the report, the rationale for the realignments are simplistic - merging Science, Geosciences and Liberal Arts is a good idea because "bigger is better", "other universities do it this way" and "it will save money." I don't find either of the first two arguments to be very convincing, and I am perplexed by the argument that money will be saved when the report also proposed adding departments which will have to be started from scratch. This will be expensive. The amount of funds saved by having fewer administrators (if that is even possible) will not make up the difference. I would like to see the numbers. I am concerned about the unintended consequences for other units. This will hamper growth of other departments as funds will be diverted to create and develop new units. I am also concerned about the processes and policies that will have to be merged - for example, the college-level review of promotion cases given the wide range of research in the merged unit. If this recommendation is adopted (and I do not support it), I recommend that the merger be staged with things like P&T processes and hiring processes being the last thing to change. These could be handled by division-level executive associate deans. (In other words, the name changes first, and everything else initially stays the same... and then pieces are merged one by one.) I think the Department of Biology should be given the opportunity to decide if they think they should be moved to another college. And, if an Institute of Biological Sciences is created, then I think Biomedical Engineering should be moved to the Institute of Biological Sciences.

---

I have grave misgivings about the proposal to merge the Colleges of Liberal Arts, Science and Geosciences. I am a member of Phi Beta Kappa and a scientist, so I fully understand the value of a liberal arts education as well as the fundamental role that basic science plays. This consolidation would damage the research and teaching missions of these colleges. The rationale seems to be a marketing and business-based justification for cutting useful administrators at the lower levels (colleges). Here are a few remarks: Some of our peer institutions have a College of Liberal Arts and Sciences for historic reasons. How many of these arrived at this by combining colleges recently? In these cases did it go well? Suggesting that having 4 big colleges make the university better, while leaving the remaining 10 colleges independent, because many stools have 4 legs is missing the point (and 3 legged stools are more stable, anyway!) of academic colleges and departments. While the first two colleges teach a significant number of A&M students, these should not be regarded as service colleges, as might be the case for many liberal arts schools. Compare the outside funding of the CoS with CoLA makes it clear that this would be an unequal yoking. The research missions of the units in the CoS differ significantly from those of the CoLA. How will resources be allocated? How does a dean of these very diverse 20+ departments credibly lead? Deans should be academics, not CEOs. There is much made of how this will help the CoLA. Firstly, I think they will have less of a voice because of the different funding structures. Secondly, I do not think it will lift their stature as is claimed. Fighting for resources with scientists does not seem like a winning strategy. Finally, how does this benefit the CoS? As the consolidated units will have a smaller voice and the goals of arts and sciences research are so significantly different I believe it would only lead to discord, and an overall diminished role.

---

(1) A larger college of Arts & Sciences makes a great deal of sense to me and could potentially create some efficiency. The fear, I have heard expressed, is that the voice of the humanities and social sciences would be diminished in such a structure but I am not sure why that would necessarily be the case. I am not sure - under the current structure - that the college has been able to communicate its mission and importance as effectively as it could (I am not casting blame here,

just observing). The other fear I have heard expressed is that research will be valued primarily for its ability to attract external funding, but it is worth asking whether we should be doing more to attract grants and contracts, and I see the potential for greater collaboration across the humanities, social sciences, and sciences. (2) I have long wondered why the Bush School and the Department of Political Science weren't more integrated. There is value in greater collaboration across the two units. I am not sure you need to be within the same college for this to happen (but it helps). My sense is that the Bush School needs an undergraduate policy major and PhD program. Political science could do more to think about the value of applied politics, quantitative analysis, and policy. Ideally, I would like to see the Bush School, Political Science, Economics, and International Studies under the same roof with greater collaborations (and joint appointments) with Public Health and other colleges, including Engineering. (Political scientists and economists can add value to engineering grants by adding a behavioral component). There is such great potential here. The challenge is balancing the professional and the academic strengths of each program. From a political science perspective, the danger is the department loses what makes it a top 25 department, a strong commitment to academic research that theoretically well-grounded and methodologically sophisticated. Having worked in a professional school in a prior job, I can say the professional/academic tensions are very real. The key, I think, to create a structure so that, wherever political science is located, it maintains autonomy over its graduate program, hiring, and promotion & tenure. Overall, this is a good idea, but the devil is in the detail. If it is mishandled, it could undermine the strengths of both programs.

---

Re Recommendation #3: Given the consultants' repeated mention that the public is losing its trust in news (although I note that much of that is deliberately driven by the American right wing) and its ability to judge information accurately, wouldn't a simpler solution than an entirely new Journalism school be simply to mandate that all TAMU students take a class on Information Literacy, and to offer IL learning opportunities through the Libraries and other existing institutions? Given the ever decreasing number of jobs in the field of journalism, how do we expect graduates of this new school to find jobs? As a member of the Libraries faculty, I am very concerned with some of the proposals regarding the realignment of TAMU Libraries. It appears to me that the consultants making these suggestions do not understand the library environment or the work and effort needed to establish a library school that would be accredited by the ALA. I note the following points. 1. The costs and complexities involved in establishing a library school deserving of accreditation are beyond considerable. A library school and a library are not the same thing - the former requires the hiring of an entire corps of teaching faculty devoted to teaching students and to pedagogy. Current library faculty are, for the most part, not teachers, and we cannot simply turn on a dime to start teaching formal classes. (Even if we could, that would drastically reduce our ability to do our regular work servicing the Libraries.) Would existing faculty be expected to teach at this proposed library school? Furthermore, the current library job environment does not support or justify an entire new school of library graduates, that would compete for a smaller number of jobs with graduates of existing schools (including the several already in Texas). 2. Numbers in this report are scarce. What exactly would be the cost SAVINGS in merging the Libraries into a new College of Liberal Arts & Sciences? 3. The Libraries serve the entire TAMU community. By placing the Libraries under a College of Liberal Arts & Sciences, this removes the Libraries from their independent status as a campus-wide service institution. 4. The diagram notes on page 24 that Cushing Memorial Library & Archives would, in a major restructuring, be removed from the Libraries and placed with other cultural institutions such as museums and gardens. How do the consultants think this would actually work in practice, given that Cushing is fundamentally a library and not a museum? 5. The report notes that 'Learning Commons that integrate information sciences with academic support services, such as the Writing Center, tutoring services, etc., provide a full spectrum of student learning opportunities that buttress the curriculum.' Are the consultants not aware that the Writing Center is already housed within the Libraries, and that the Libraries carry out a host of student learning opportunities already?

---

- A more in-depth and data-driven review is required to show how the proposed realignment of COSC would respect the heritage and causal factors of how it became a nationally leading program to determine if Proposal #9c would help increase or undermine its benefit to its constituents and A&M.

---

There is a strong suggestion to pull Poli Sci into the Bush School. The Bush School also has a large number of people in economics -- in fact, the number of economists and number of political scientists is about the same. In fact, public policy is as much about economics as it is political science. I think a way to reframe this is more of "should Poli Sci and Econ (and perhaps other departments) be pulled from the School of Liberal Arts and be put into the Bush School?" This would mean that the Bush School would be significantly modified from being a school that currently offers only masters degrees in preparation for jobs in government and other public service, to a school that is offering PhD programs etc. with a much more academic focus. There are some other schools for which Econ and Poli Sci are housed within a

School of Public Policy. Oregon State is one of them. There are also schools where Econ departments are housed within business schools rather than within liberal arts. I think that before this initiative is undertaken, there should be a more significant study done exploring the pros and cons of pulling Poli Sci into the Bush School. The report could do more to enumerate these. Note that the Poli Sci and Econ departments, which used to be in the same building as Bush School, have now moved to a different building.

---

Pros Foster more collaboration among various departments Introduce students to a broader course scope during their academic tenure Bring all scientific/liberal arts departments under a giant umbrella where each department can enhance another whereby one department can conceivably fill the gap of another Cons Possibility of losing individual department identity Underperforming departments will have to be supplemented by departments with more students and "clout" Departments with a heavy research load will subsidize departments that do no research Departments with heavy teaching loads may have issues with faculty/staff who do not teach even though they may have heavy research loads

---

I like the idea to combine the College of Liberal Arts, the College of Science, and the College of Geosciences.

---

This is the most difficult and - I presume - controversial section of the report. My primary academic home is in Liberal Arts. While I regret seeing the college merged into a larger entity, I can see some of the rationale. I don't see how the libraries fit into this model. Our academic librarians are not instructors and I'm not sure how we can create a library program without a massive personnel overhaul. The proposal to create a Department of Journalism is not, to my mind, viable. Journalism is a profession in crisis across the country. The connection with MKTG in Mays is, frankly, a bizarre suggestion. Mays has no incentive to cooperate with a department that will be a competitor. I also find the proposed move of Political Science to the Bush School to be an odd and needless one. The Bush School needs to stand or fall on its own - adding an undergraduate component dilutes both brands.

---

I hope that with growth we never lose sight of that it means to be an Aggie and the legacy on which we stand for over 100 years.

---

Recommendation #9d. If HLKN need to be consolidated in TAMU Health - the School of Public Health, please consider that this seems to be a logical step for the Health Division in HLKN, but not for the Kinesiology Division that included the clinical research in the Center for Translational Research in Aging and Longevity (CTRAL). I propose to convert the Division of Kinesiology to the Dept of Kinesiology and to place this into TAMU Health - College of Medicine. That makes more sense in relation to kinesiology, but specifically for the clinical research in CTRAL. If this is not possible, I suggest that move only CTRAL to the college of medicine.

---

I am an Associate Professor of International Affairs at the Bush School. The Bush School is entirely oriented around training future public servants. It is why we admit the students we do and why we have recruited the faculty we have. The Department of Political Science serves a completely different group of students and has recruited a completely different faculty. I cannot see how either would be well served by a merger. Our students would no longer get the unique education that prepares them for public service. Political Science's students would no longer be trained in political science. I respectfully disagree that there is much meaningful duplication between the Bush School and Political Science. And if the Bush School is eventually going to take on undergraduate students, it would be optimal to do so as part of our own thought-out process, as opposed to rushing it through as part of a forced merger.

---

Many of the suggestions regarding the new College of Arts and Sciences are welcome - creating a School of Arts within the college and expanding several existing departments to fill this out seems particularly good; merging with Sciences and Geosciences seems fine, though it's confusing from the report whether this is intended to increase the status of the humanities and arts within the university, or to consolidate the image of this university as a science and engineering university, with the arts relegated to decoration (and the humanities completely ignored) in a "STEAM" initiative. If student interest in journalism is dropping, it's not clear why adding a department of journalism makes sense. Moving political science to the Bush School makes some sense, but it seems like it would make more sense to merge the Bush School into the College of Arts and Sciences. Creating a department of library sciences (or perhaps library and information sciences) seems like a very welcome move. However, it's not obvious that merging the University Libraries into this department is the most helpful idea, unless the existing faculty librarians think this is a good move.

---

Technology Management as currently organized is very specific to Education. It has zero fit with Engineering Technology - none of the courses are in ETID, and Technology Management takes different math and science than Engineering. If the Technology Management major was in Engineering, following the common freshman year, it would be a very different major, and might die as a result. Construction Science fits poorly in Engineering. It has a different accrediting body, and

takes different engineering and science, and has a very different curriculum. It isn't a great fit in Architecture either, but is a better fit than Engineering. Visualization would not be a very good fit in a Visual and Performing Arts school. The department head for Visualization is a computer scientist. So are a number of their faculty, who collaborate with computer graphics faculty in Computer Science. But other Viz faculty are graphic and visual arts, and they do not fit with Computer Science either. Visualization is not a great fit for Architecture, but the undergraduates in Visual Studies have more fit with Architecture than they do elsewhere.

I object very strongly to the proposal to move the Department of Political Science to the Bush School. The political science PhD program is one of the strongest in the country, and likely the best social science program in the University. We have our own national identity as scientists/scholars/researchers and this identity does not align with the primarily public administration/public service orientation of the Bush School. We do NOT want to teach our subject matters (formal theory, basic and advanced statistics, American politics, political theory, comparative politics, international relations, etc.) to Bush School students who are largely uninterested in scholarly research. I know they are uninterested, because I was once a part-time faculty there. As it stands, the political science graduate and undergraduate students are eager to be in our program. However, based on my prior experience with the Bush School's Masters level students, they are not so eager for our scientific approach and body of knowledge. Thus, while it may make organizational sense to move Political Science to the Bush School, it does not make practical sense.

Recommendation #1: AGREE I'm supportive of the idea and structure for TAMU to have a College of Arts and Sciences, but I do not believe that all departmental moves were made with accurate and complete information, and for those that were not vetted at all by MGT (HLKN's move), the move will weaken several affected programs (and a large number of students will be negatively impacted in an effort to integrate two small groups of students in community health in HLKN and SPH). [REDACTED], I will limit my recommendations to this unit under Recommendation #. Recommendation #2: AGREE Recommendation #3: No recommendation. Recommendation #4: No recommendation. Recommendation #5: No recommendation. Recommendation #6-8: No recommendation. Recommendation #9d: DISAGREE While I appreciate that MGT tried to keep HLKN whole, I do not believe they had the full picture of the Department, and primarily made decision based upon the need for SPH to be propped with HLKN's financial resources. I'm a supporter of making good fiscal decisions, but this amounts to making a decision for the whole unit (3500 undergraduate students and 300 graduate students) based upon one small component of a large unit. SPH's community health program is very small program and was born out of HLKN's program, so why move a large, successful academic unit like HLKN with basic scientists into a school of public health just to merge one tiny piece. 1) HLKN should be moved to the College of Arts and Sciences, if a move is to be made. HLKN is comprised of 4 divisions and multiple programs, but the comments in the report only mentioned Community Health, which DOES NOT reflect the majority of our students in HLKN. In fact, Allied Health, KINE, and SPMT are much larger programs (and make up the majority of our students) and majors (and degrees), and are where many of our pre-professional students are housed. Moving a large dept. to SPH to integrate one small entity will greatly weaken our non-Health programs. 2) Health Education's Community Health component is the only entity that could fit into SPH, if a move were to be made. The leadership of HLKN fully supported the program review that took place between SPH and HLKN, and the committee (made up of faculty from both areas found that there was no significant duplication of programs. This report appears to have been overlooked. 3) Kinesiology contains science-based pre-professional programs, and is second only to Biomedical Sciences for sending more pre-professional students to Medical school, dental school, and other professionals schools. Our faculty are both basic scientists (muscle biologists and physiologists) and clinical researchers (integrative physiologists with metabolism focus) which would interact well with the basic and clinical researchers in the Dept. of Nutrition, Biomedical Sciences, Vet Med, COM, etc.). So a move to the College of Arts and Sciences makes more sense for our students and for our faculty. The MGT program did not present any tier 1, R1 peer institutions in KINE in their report as justification for this move. 4) Sport Management, our 3rd academic division (which has a very large UG population) does not at fit at all in SPH. It would fit into Recreation and Parks' new Dept. in the College of Arts and Sciences Agrilife. SPMT has to remain with HLKN and KINE because it's PhD program is a KINE degree. 5) Dance Sciences Program: While HLKN would hate to lose the awesome DS faculty, I do believe this move could benefit them in terms of having the facilities and collaborations available to them to hold performances, expand their offerings etc.. They have done a great job at a university with no true Arts facilities. However, some of their teaching appointments are tied to PEAP KINE classes, and they also have a teacher certification component that may be negatively impacted. This would need to be teased out, but it is possible. 6) PEAP was not mentioned in the report. PEAP should remain in HLKN as its faculty teach the basic core courses for KINE majors. We do not have ample teaching faculty with expertise to teach the lower level skills

courses they teach, and they are the experts.

---

I agree with recommendation #2 (establishing a School of Visual and Performing Arts). For a university of its size, TAMU does not have a very large arts program. I graduated from a school of music within a large public university. A big draw for myself and many of my classmates was that we could get a music degree, along with another degree (in case the music degree didn't work out!). Being at a large university gives you a lot of options to do this and our school of music had formalized programs with other degrees on campus for art administration, education, etc. Also, things like student recitals, student orchestra concerts, etc. were attended heavily by community members and were another way to draw community members into the university space. Creating a new music program would require more than what the report alludes to, it wouldn't simply be accomplished by transferring existing faculty. The program would need to hire significantly more faculty (at least one faculty member per studio or instrument) and require other things to be accredited (such as a music library). I disagree with recommendation #6 (merge university libraries into a new department of library sciences). The authors of the report are misinformed about the differences between a college library and a department of library science. To be an accredited library program (of which there are already numerous in the state) many of your faculty have to have PhDs. Librarians who work at the University Libraries largely do not have PhDs, their terminal degree is a master's. As the report points out, librarians are performing important work teaching students critical research skills to use in their academic journeys. The work of a library school is to teach graduate students how to become librarians, not to teach undergraduate students these critical research skills. While I don't disagree completely with the idea of creating a library school (I think it could afford opportunities for existing librarians to become more engaged with student learning), the library school would have to be staffed with newly hired faculty with PhD's in library science who desire to teach other people the profession of how to be librarians. Pulling existing librarians out of the current University Libraries would be a disservice to the many students who rely on librarians for research and information literacy assistance.

---

The statement that "more than 1/2 house liberal arts and sciences in the same college" has no meaning. Is that good or just 'conventional?' What are the metrics to show that is effective and best? Majority rule? That our smaller colleges offer many degree paths is positive--not negative. The arguments justify the changes planned without proving that this is good to do. Bigger is not necessarily better. Why not drop all colleges? Then this uni-university would offer more degrees than any other system. There was journalism here. A prior administration closed the department. Why open it again now? Merging departments and colleges should be faculty-lead. These mergers should and would take more than nine months so that faculty would grow together and not feel they were merged in a "shotgun wedding." Any central plan that forces mergers at department and college levels is the antithesis of shared governance. Bigger, consolidated is not always better.

---

By eliminating colleges, and consolidating to four, the remaining deans offices will become even more unwieldy and inaccessible to students and faculty than they are currently. Faculty will feel disenfranchised, is this a way of telling us to go find another university to give our lives to? I feel betrayed at this point. I normally see opportunity for improvement in disruptive shifts, all I see here is the consolidation of power, additional remoteness of the administration to students and faculty. Will I be represented in promotion and tenure proceedings by a Dean who has even less of an idea what I do and why its important than what I deal with currently? Please show us the upside of this, and soon, please.

---

COALS is a life science, so why not integrate into the proposed College of Arts and Sciences?

---

As a member of the College of Liberal Arts, I support combining it into Arts and Sciences. I am surprised there was no initiative to create a Department of Humanities with History, English, and Philosophy as these have all lost majors and have aging faculty of uneven quality (i.e., a few faculty do the majority of the research, service, etc).

---

I agree with the realignment. Having larger colleges will cut back on a larger college bullying the smaller ones.

---

I have a few comments mainly about combining college of arts, college of science and college of geo sciences to create a new college. I think it is a bad idea, explaining it why and adding some suggestions. I am not against combining colleges as long as the departments are homogeneous in nature. 1. Why we want to combine colleges: mainly due to A. create an homogeneous entity so that it is easier to create interdisciplinary cutting edge training or research program. College of Arts is so different than other two colleges so that it will not make much sense in that way. B. Cost cutting: i think due to heterogenous nature of the departments it will need many more administrators (like associate deans) to represent each department just to understand the language and basic standard they use. Moreover, TAMU is one of the leading schools with minimal administrative expenses so I doubt this merger will save it more. On the other way, the initial cost

will be huge in terms of space and other administrative expenses! C. Some of the examples given in the report are not fully correct. Leading state schools have College of Science like Purdue, UT Austin, UCLA,... The report repeatedly said we should follow Purdue's example (which I agree) and their structure is very similar to us. D. My suggestion: Some state schools still have large Arts and Science traditional colleges due to initial cost to change them. Most of the recent changes are to create small, homogeneous interdisciplinary colleges like recently Berkeley created College of Computing, Data Science and society. Cornell is also moving in that line (in fact invited me to lead a department there). Hence, rather than moving towards historical large colleges we should move in this cutting edge direction. College of Arts will get much more exposure if they join our famous Bush school. If we have to realign colleges, I will prefer to have a new college of Computing and Data Science having Computer Science, Computer Engineering, Stat, Visualization, info and part of Maths (approximation theorist) together. If a college is not possible, I will request you to consider a joint research institute under science and engineering. Please take a look at our institute [fids.tamu.edu](http://fids.tamu.edu) as a building platform. My next major concern is moving Biology out of Science. 100% of the top institutes (including Purdue, Michigan, UT) have Biology in their college of science. Top students take biology major to learn the foundation issues. Moving it to Agschool will make it lose its depth and luster. It will have similar effect of moving Physics in Engineering or Maths in business school. It needs more funds to get experimental facilities but changing the college is not going to help it. Some of the suggestions in the report are really good (related to students or faculty issues) but most of the realignment ideas are not good at all! We have to decide that if we really like to invest so much for Arts and journalism (when already we have a few top rated schools in TX in these fields) or should make our existing strong departments stronger. Medical school should be one of our priorities to bring more NIH money which may be critical to move up in research ranking. We already have suffered by investing in a low level law school and not sure how it helped us to move towards the top. I have full trust on president Banks and the current administration hence provided my honest opinion!

The plan makes sense. I have often wondered about some of the distributions of similar content in various places. There are a lot of turf battles.

Recommendation 9a (reassigning University Studies to a College of Arts and Sciences) seems fine in theory but will require a significant re-working of the rules of a University Studies degree. Currently, those degrees require students to minor in two different colleges. Once the colleges are consolidated, a student could no longer complete a University Studies degree with minors in, say, Geography and Philosophy (an excellent choice for a student in the University Studies in Society, Ethics and Law program). I recommend that University Studies programs housed in a new College of Arts and Sciences permit two minors within that college. That will be an improvement over the current model, which doesn't allow USLA majors to combine Philosophy and Economics despite the significant methodological differences in those two fields and the popularity of that combination worldwide (see Oxford's wildly successful program in Philosophy, Politics and Economics).

I think it makes sense.

College of Engineering needs to be separate from Liberal Arts. Art is not a science.

Dear President Banks, I hope you are doing well! As a fellow Duke degree holder (BSE - Biomedical Engineering) I applaud the overall MGT recommendation of reducing our current administrative behemoth of 16 colleges down to 4 academic units: AgriLife, Engineering, Arts and Sciences, and Texas A&M Health. At Duke, UNC, and many other AAU Tier One institutions mega-colleges of Arts & Sciences (e.g., Trinity College), Engineering, and Health or Health Science are fairly typical. An AgriLife College or academic unit is also common as you know in many Land Grant Universities, including Cornell. There are many exciting new possibilities. The road to academic excellence is built through academic villages. When I was hired at Texas A&M, A&M was 6th in research expenditures and Duke was about 30th. Today, Duke is #8 in research grant funding and TAMU is 19th (NSF data). Duke found and built academic villages in the Levine Center and Fitzpatrick Center that focus on cancer research and nanotechnology. For example, the Levine Center is literally integrated with the School of the Environment, Biomedical Engineering, Computer Science, College of Medicine, and Chemistry – the ingredients necessary to tackle the complexities of oncogenes and oncology. Comments and Suggestions Regarding Finding #2 and Finding #9: • Separation of Health & Kinesiology from the College of Education and Human Development – I think this is appropriate re: better fit within the new Academic framework. HLKN has moved to West Campus in closer proximity to AgriLife and TAMU Health programs, which have academic programs and interests that are more closely related to Health & Kinesiology. • Academic and Physical migration of the Dance Program into a Fine Arts unit within the College of Arts and Sciences. The Dance Program should move into a Fine Arts

facility on East Campus. • Recommendation 9d: Consolidate the Department of Health and Kinesiology in the School of Public Health, including clinical research associated with the Department of Health and Kinesiology. The Department of Health and Kinesiology (HLKN), located in the College of Education and Human Development, and the Department of Health Promotion and Community Health Sciences (HPCHS), located in the School of Public Health (SPH), have similar program offerings. HPCHS and HLKN have attempted to differentiate their degree programs for several years with little success. The overlapping degrees are the Bachelor of Science in Public Health, Master of Public Health, and Doctor of Public Health within HPCHS, and the Bachelor of Science, Master of Science, and Doctor of Philosophy in Community Health at HLKN. - This is an oversimplification as written. Overlapping and redundancy of programs are true primarily for the Health Division within HLKN and TAMU Health. The Kinesiology Division is distinct from all other programs at Texas A&M and historically includes applied scientists and investigators in Exercise Physiology, Motor Neuroscience, and applied Biomechanics as well as PEAP. Investigators in the Kinesiology Division have been funded by NIH, NASA, NSBRI, DOD, NSF, American Heart Association, Muscular Dystrophy Association, American Lung Association, foundations, etc. - There are universities nationwide where Kinesiology programs are within a College of Health or Public Health: University of South Carolina, University of Utah, University of Oregon, University of Illinois, Chicago. However, there are Kinesiology programs that are housed or fit in with AgriLife: UCLA, University of Missouri. Investigators in Kinesiology have established strong research relationships and collaboration with the Departments of Nutrition, Animal Science and ILSB faculty. Many of our Kinesiology faculty are members of the Graduate Faculty in Nutrition - The Sport Management in HLKN has overlap with the Mays Business School as well as Recreation, Park, and Tourism Sciences. - HLKN is a large department with 3-4 divisions, that in some universities (e.g., University of Florida, University of Illinois, University of South Carolina, East Carolina) are a full college - In order to (a) optimize facilities and resources, (b) find best academic fit, (c) reduce academic redundancy and overlap, and (d) promote externally funded research I propose the following models and suggestions in response to Finding #9 and Finding #2: Option 1: • Health Education merged and moved into Public Health in TAMU Health • Sport Management merged and moved into Business or RPT • Dance to Fine Arts and College of Arts and Science • Department of Kinesiology formed, retaining PEAP and HCRF within TAMU Health o Could add Physical Therapy program to Kinesiology Option 2: • Health Education merged and moved into Public Health in TAMU Health • Sport Management merged with Business or RPT • Dance to Fine Arts and College of Arts and Science • Athletic Training to TAMU Health • Department of Kinesiology formed, retaining PEAP and HCRF within AgriLife Option 3: (My preference) • Health Education merged and moved into Public Health in TAMU Health • Sport Management merged with Business or RPT • Dance to Fine Arts and College of Arts and Science • Athletic Training to TAMU Health • Kinesiology merges with Nutrition to the new Department of Nutrition and Kinesiology (retaining PEAP and HCRF) shared by AgriLife and TAMU Health □ This model is used to great success with the University of Missouri, Virginia Tech • Most faculty within the Nutrition/Kinesiology hybrids are NIH funded In my view, these 3 models, coupled with externally funded new hires and reorganization of facilities would carry the Kinesiology program to #1 Graduate status in the nation. My understanding is that the sole #1 graduate program at TAMU is currently Petroleum Engineering. The Kinesiology faculty supported and attempted to hire the Department Head of the #1 Kinesiology Graduate Program, Dr. Jim Carson from the University of South Carolina's School of Public Health and Department of Exercise Science. Dr. Carson has had continuous funding from NIH for 20 years and while administrator the number of active NIH R01s rose from 2 to 12. Dr. Carson is currently Associate Dean of Research & Graduate Studies in the University of Tennessee's College of Health Profession. Dr. Carson would be an ideal fit as a leader in Public Health or AgriLife at Texas A&M. Global, Paradigm Changing Recommendations: The key academic components absent at Texas A&M University, TAMU Health, and missing from the MTG Report that would propel Texas A&M into Top Ten status: 1. Teaching and Area Hospital in the College Station/Bryan Campus. Clinical HSC facilities in Temple, Houston, Round Rock, Kingsville, especially when the core of medical science faculty is in College Station dilutes the impact and federal funding draw to the medical school. A centralized, area and teaching hospital linked to Texas A&M, and preferably on the Hwy 47 property would serve millions of Texans from the Louisiana border to the capital city of Austin. - Game changer for TAMU Health, NIH Funding, collaboration, Drug Development, and Biomedical Engineering TAMU, Bryan, College Station, hospital admin partners would have to sit down and seek support from the state, federal grants, and private sector. In addition, faculty, students, local citizens must travel to Houston or Dallas for specialty care. There are less than 500 beds in BCS in total. Local hospital ICUs have been (over)full during COVID waves. 2. Comprehensive Molecular Research Core Center and Support. Expand or reimagine TIGM as a world class center for generating tissue-specific, conditional overexpression and knockout mice, transgenic and transfection support and training.

I am thrilled to see the recommendation to establish a School of Visual and Performing Arts! I teach in Film Studies and have experience in film & television production. The report recognizes the incredible opportunity TAMU has that is not currently utilized. Supporting the addition of video production to the rich diversity of Performance Studies while anchoring this new school with the Viz Lab would allow all of the parties to interact in new ways. Each would help the other to grow in ways they cannot in current configurations. In addition, if video production were added, the opportunity presents itself to have a unique research-based and trade-based program. The latter is already done in Georgia to meet the workforce demands for skilled labor ("below-the-line" crew) through certificate programs. Combined with a research-based degree program funneling into the "above-the-line" (writers, actors, directors, producers) positions, we could build a program truly unique in the state, especially if we plug into technology innovation in science and engineering as applied to the film industry (for example virtual production that the Viz Lab is already stepping into). We could also plug into the TAMU Law program (entertainment/IP law) and KAMU. What if TAMU could be the source of the next innovation in camera technology? Or lighting, or sound? The go-to for set safety training? The ability to do so requires both STEM and the Arts, which this new school could become the incubator for. As a four-time Aggie and a filmmaker, this makes me so excited!

---

Seems good since it appears to cut some upper admins

---

Some of the changes show an incomplete understanding. The proposed move of HLKN to Public Health is one example. First, there are more programs in the department than just Health and Kinesiology. Sport Management has over 750 undergraduate and master's students, along with 15 pursuing a PhD in Kinesiology with an emphasis in Sport Management. The program also has 15 faculty members. The analysis of peer institutions does not take these dynamics into account. IU-Bloomington is the only institution where Sport Management is housed in Public Health (along with Kinesiology). At others, such as South Carolina, Temple, UMass, and Illinois, they are a separate department. I was also not aware that we considered Central Oklahoma, Miami University, Nebraska Omaha, and North Dakota as peers, but they are listed as such. HLKN also has a large group of faculty members who deliver Physical Education Activity Program classes. Where would these classes go? Would the faculty also be a part of Public Health? I appreciate that colleges and departments are largely administrative structures shaped by history and the set of circumstances surrounding the programs and university. I also note that the report does not speak to curricular issues directly. While these points might be true in concept, they are not in practice. The merging of programs influences how and what classes are delivered, the recruitment of students, and faculty opportunities. All of these issues should be guided by the faculty -- not consulting firms that do not have a correct understanding of department and also present information that is not correct.

---

I find the proposal to create a college of Liberal Arts and Sciences to be a fine one. (I am a mathematician with a strong liberal arts background acquired at a land-grant university). This strengthens the power of the dean representing these core academic disciplines.

---

Most of the recommendations are great, but some are not good. I do not like the idea of creating a new Institute of Biological Sciences within AgriLife. The Vet School's Biomedical Sciences program serves undergraduates who will go to professional schools such as medical school, dental school, pharmacy school, Physician Assistants school, and graduate schools related to biology (e.g., nutrition and reproduction). The Department of Biology provides general training for students in biology, not species focused as in Agriculture and Vet Medicine. In addition, I do not like the idea of combining College of Science and College of Liberal Arts into one college, because they are very different disciplines.

---

It seems that the Academic Realignment is only benefitting the College of Engineering. The remaining departments lose out on the benefits of having a dean that might know something about their disciplines. Why is Engineering not part of the redesign? How do students and faculty gain from having Arts and Sciences put together into one unit? The students in those two colleges do not have anything in common in their degree programs EXCEPT the same core curriculum that the Engineering students take. If a reduce to 4 units is so necessary, which I am not sure it is, why are the STEM disciplines not combined, as those students take many of the same courses as upperclassmen. Advising for such large units is also a concern. Students already receive incorrect information because of lack of understanding by advisors. Lumping these very different majors all into one unit will only make matters worse. When looking at other Tier 1 Universities, they have much the same structure Texas A&M currently has. If that changes, it may become harder to draw in strong research faculty to units other than Engineering. As the age of our faculty increases, the need for new strong research faculty also increases. Graduate students will also look to other Universities for this same reason.

I hope that a new College of Arts and Science does not become a land of misfit toys. There is certainly models for this consolidation but many in the administration are associated with Engineering and Agriculture program which are not often included in such Colleges in peer institutions. The size will make it more influential but the inner functioning will depend critically on the internal structure. I worry that several high ranking departments could be diminished and efforts should be made to ensure that this does not happen with the merger. Many of the other changes make sense and are long overdue. It is unclear, however, why the College of Architecture (for example) would remain a College despite losing Construction Science and Viz. This makes no sense in terms of efficiency and several similar changes have the same issue. I would argue for additional consolidation of Colleges given the reasons for consolidation of Arts and Science (beyond the fact that there are examples at peer institutes).

---

There are many things I like about this report, including moving the Visualization program out of the College of Architecture, providing instruction in library and information science, combining the Bush School and the Political Science Department, and drastically increasing TAMU's investment in the fine arts. I also understand and applaud the impulse to spend less on administration by combining different units. However, I am persuaded that given the particular culture of TAMU, which privileges STEM fields and (not to put too fine a point on it) despises achievements in the humanities, folding together the humanities, social sciences, geosciences, and hard sciences into a single College of Arts and Sciences will still further starve and brutalize humanities disciplines that have been on life support ever since the departure of President Gates, the last top administrator to show these departments any respect. Even within the existing College of Liberal Arts, resources and recognition have been disproportionately directed toward the social sciences at the expense of the humanities. This situation will only be magnified if the mix of departments in the college is weighted still more heavily toward those whose major focus is on the securing of grant money and the operating of labs rather than on providing quality education to students via small classes, detailed feedback on assignments, and personal attention.

---

I've had experience as an advisor as well as coordinating with other advisors. I strongly object to centralizing the undergraduate advising because such advisors rarely have the experience and knowledge necessary to advise specific majors. For example, I was an advisor and professor in mathematics. The advisors in general studies didn't understand that advising students to take general mathematics classes instead of engineering or science calculus limited the majors said freshman could enter. I expect there were be cost savings by centralizing the advising, but it would be detrimental to the success of the students. Please do NOT do this.

---

The merging of the College of Liberal Arts, the College of Science, and the College of Geosciences is by far the scariest part of the proposed changes. My only advice is to proceed with caution. You do not want to destabilize Chemistry given the metastability of its top-performing faculty who could easily get jobs elsewhere. If you go about this merger with tact, I think that it could be a win. The current deans have little power given the size of their operation. A new dean would certainly have a stronger voice on campus. The budget of the individual departments should become proportional to the money they raise externally, to the weighted credit hours they teach. Please, do not take away from strong departments to strengthen weak ones.

---

Recommendations in this category appear to be of organizational nature. As faculty, my interest is in retaining control over our academic responsibilities. I like that you recommend to protect this.

---

Structural reorganization of Colleges has no clearly defined benefits (what is the goal? to mimic structure used at another university? but why?) and will be carry large costs. Financial costs will be large, but even larger will be hidden costs in wasting faculty time.

---

I am in full support of moving construction science to engineering, for three reasons: (1) From the research productivity perspective, the new wave of COSC faculty is heavily involved in externally funded research that tackles important engineering problems in the natural and built environments. COSC faculty have recently brought in multiple NSF grants from extremely competitive programs such as CAREER, Future of Work (FoW), Smart and Connected Communities (S&CC). It has been, unfortunately, the case that because of the separation of engineering and architecture, COSC has not been able to achieve its fullest potential by competing for larger grants such as ERCs, AI Institutes, ... and has had the lower hand with DARPA, DoD, ... grants. (2) From the perspective of student recruitment, we tend to get the second-tier students most of the times because the top ones go to engineering. Many of these students (especially at the graduate level) do not know about the research programs in COSC. We have been receiving many requests from engineering students who would like to switch to COSC and work on one of our nationally-recognized research projects. (3) From the standpoint of diversity and inclusion, I believe that moving COSC to engineering will open up the eyes and ears of a very traditional group of (often) instructors and lecturers to the diversity of the engineering community. Many of these

people have not seen or interacted with anyone who is not a white middle-aged man in a construction site! This should change if COSC wants to become a world-class academic unit, and one way of contributing to this change is to expose people to new ways of thinking, working, collaborating, and communicating; something that engineering can teach us. There is much talent in COSC (many of us have engineering backgrounds anyway), and there is potential to do big things. This realignment will be a huge leap in the right direction.

---

I really liked the ideas of creating the Arts and Sciences college, the department of journalism, and the department of performing arts. Particularly the performing arts: There are so many good musicians here, but currently the only way for them to perform that I'm aware of is by participating in the marching band, which you can only do if you're a member of the corps. I think students and people in the town would really enjoy having a broader variety of events to attend here and I hope you will take this recommendation.

---

On merging the CLA with several others into a College of Arts and Sciences. I see the benefit of that, but social sciences are very different than humanities and should not remain lumped together in the new college. Arts and Sciences do research and therefore train graduate students VERY differently and evaluate scholarship very differently. On the merger between political science and the Bush School. It would make a lot more sense to let them first exist independently in the new college of arts and sciences. And then those running that college can later decide. From my view as someone who works in political science and who has also worked in a professional school, a merger with international studies makes a lot more sense than with political science. But the logic of how to best decide should lie with the new dean of A&S after having a chance to observe and evaluate all the relevant units before deciding on a merger. Training people to be public service or government professionals is often very different than training them as social scientists (at least at the graduate level). While the undergraduate programs might merge with some ease, the graduate programs need to exist separately and thus merging the two will cause problems for both.

---

## Academic Realignment - Staff

Please provide your comments related to Academic Realignment:

---

I view the recommendations for academic realignment as the riskiest of the planned changes. I am convinced that potential benefits are significant if the plan is executed well, but if this is executed poorly I am concerned that it will dilute the science colleges without improving the college of liberal arts significantly.

---

Academic Realignment: Finding #1: Combining the College of Liberal Arts, College of Science, and College of Geosciences to create a new College of Arts and Sciences. Because this was specifically scoped in the project, my assumption is that this is a priority and is likely to occur. Going on that assumption, my recommendations are made on becoming a part of the solution and success of the merger, specifically in the implementation of the financial, business operations, and HR/Payroll of the newly formed College of Arts and Sciences. The College of Geosciences has already successfully centralized processes. I would further suggest that the business operations be centralized at the new college level, while the Assistant Dean's separate the financial and budgetary support between the two unique divisions within the newly formed College of Arts and Sciences: Physical/Earth Sciences and Social Sciences. This will be a monumental task that can be successfully done with the correct individuals taking the leadership roles in this transition. Each college is very unique in their current operations, so the implementation will need to be carefully managed and have the full support of leadership of the newly formed college and of the university. Further, I would like to suggest that the fully centralized model already in place in the College of Geosciences, which was specifically called out as a model of successful centralization in the 2014 PWC Management Review, can be successfully scaled at the newly formed College of Arts and Sciences college level for all operational functions in the college: IT, Finance, HR/Payroll, Travel, Scholarships/Tuition, Accounts Payables/Receivables and Facilities. The College of Geosciences has the technology infrastructure in place with Laserfiche, that could be scaled to incorporate the business functions/HR/Payroll of the other two colleges (Liberal Arts and Science, and possibly Libraries).

---

It is unclear who is deciding this "sunset" of "community-focused programs" and what metrics. This should be better communicated otherwise the community and staff support them WILL be even more distrustful of what appears to be reckless change by a new administration. SWOT analyses on this would be helpful as well as strong community and staff buy-in.

Not sure why we need to duplicate efforts for a journalism program when we have Ag Journalism and Communications. My vote would be to invest energy and resources into that program instead.

---

Combining Colleges only makes sense if it directly leads to increased collaboration and access to resources. It could work but it should be done carefully. Faculty and staff must have a voice. Essential to this realignment is a lean Administrative model that balances bureaucracy, expediency, and resources stewardship. I do not agree with merging University Libraries themselves into the College of Arts and Sciences as they should either stand alone or be placed with Cushing in Academic and Strategic Collaborations. I wholeheartedly agree a new Department of Library Sciences should be created and its about time Journalism came back. A&M is missing a generation of Journalists and needs to contribute heavily to this space.

---

Howdy, I recommend that the Technology Management program should stay in the College of Education and NOT transition to the College of Engineering. There are several distinct characteristics that separates Technology Management and the Engineering Programs. As a former student, I had started in Computer Engineering – the Computer Science track, which is a fantastic design. The courses I took obviously pertained to computer programming. However, as that degree along with many degrees offered in engineering, they do not provide the main difference that Technology Management provides and that is the business aspect. The Engineering programs excel in developing their students' knowledge that pertains to their related field. On the other hand, the Technology Management program does that as well, but also include several HRD and Business classes from Mays. This provides the missing skillset that many IT students tend to not have after graduating and in general. Those HRD courses allow the Technology Management students to understand the business aspect along with conflict management/resolution, how to present in a business world, and being able to be well spoken. These distinct skills are typically lacked in IT individuals, especially in students prior to graduation. I mention this as the difference between Engineering students and Technology Management student because I saw that when I was in CompSci and realized the difference when I transferred to Technology Management. I saw that Engineers were focused on the knowledge and not in presenting the knowledge and the understanding of how the businesses perceives IT. I can see how, on the outside looking in, that Technology Management looks like it fits right in the College of Engineering program. However, Technology Management is very different from Engineering. It is focused on various types of technology and not just specifics—although, students tend to seek and learn more about what they are passionate about on their own. In addition, students in this program can have a variety of skills such as computer programming, instructional IT teaching, and even earning certifications. Which brings me to my next distinct characteristic between the programs. The Technology Management program also motivates and influences their students to learn, take, and receive additional certifications on their own in addition to the degree, skills, internship(s) for which they become extremely markable in the work force. These certifications are not limited to the ITIL Foundations, A+, Net+, Sec+ for which all are looked at as a great starting point in any entry level IT position. I mention this as a former student from the Technology Management program because it is a major opportunity for students to graduate from the Texas A&M University with a loaded resume. Many IT individuals lack the personable skills and avoid speaking publicly and even try to hide behind a desk. Technology Management breaks down that barrier, which is why many, if not all, Technology Management students can speak very well with superiors, colleagues, and have those business skills to be more marketable after graduating. I am not saying that Engineering students cannot do the same, but the program itself revolves around a well-IT student with both business and IT knowledge skills. The last distinction in Technology Management program is that you are required to have an internship at the end of your graduating semester which not only helps students get jobs after graduation but allows them to apply their knowledge and skills that the program has taught, in ordered to be successful. Internships are not required by the Engineering program. Instead, it is recommendation, for which is usually done in the summer. If the program is transitioned to the College of Engineering, I can see the intentions of removing the whole HRD/business aspect from the program itself (which again, is the difference between this program and all IT related programs in the college itself). In addition, I can see that the Program Board will place computer programming classes in the Technology Management program for which would not make sense as the Computer Engineering program is design primarily for that. I recommend that the Technology Management program stays in the College of Education as the program is continuing to improve yearly.

---

I do not believe it's in the best interest of one university to follow peer institutions. Journalism is in BIG trouble and I would not let any child invest in the degree at this time. If only honesty could be enforced....to me, the timing of this recommendation is off and in the end, it's not my choice alone.

The Department of Performance Studies was transformed from a conservatory model to an academic studies department at the bequest of the Texas Higher Education Coordinating Board a number of years ago. This change in curriculum and focus came at great cost to the department. Many of the faculty resigned rather than be relegated to a burgeoning (and somewhat obscure) field of study. The number of majors and minors decreased over the years, and what once was a lively and active sound recording studio and black box theatre have all but gone dark. Although I think it would be wonderful to have cutting edge music and theatre departments, I believe our movement on this front might be restricted by entities outside of the university. I would also like the administration to consider whether it is in the best interest of a super college like the proposed College of Arts & Science to lose a core teaching and research center like the Department of Political Science. I was encouraged to see that the department was deemed successful by the review firm, but I think their desire to see that success translate to the Bush School is misplaced. Although both the Political Science Department and the Bush School both deal in politics, this is about where the similarities end. If, after review, the administration feels that these entities should be combined, I would love to see some thought given to bringing the Bush School under the College of Arts & Science.

While I appreciate and desire increased diversity at TAMU, I think the university should not spend time and effort (right now) on establishing a School of Visual and Performing Arts. I think that in the grand scheme of issues that need to be improved at TAMU, or can be improved, this kind of change is least likely to be impactful. In contrast, I believe that consolidating the College of Liberal Arts and the College of Science into the College of Arts and Sciences would be very impactful- negatively impactful. This kind of change will alienate high quality faculty and staff, resulting in attrition. If I were a future student interested in science, TAMU would be less likely to make my short list of schools.

I like the proposals related to the College of Arts & Sciences and the performing arts a lot. I like the idea of bringing back Journalism. The proposals made regarding Construction Science and Visualization make sense to me also.

Incorporating the College of Geosciences into a College of Liberal Arts & Sciences would be detrimental to the mission and vision of Texas A&M as land-, sea-, and space-grant institution. Also, Liberal Arts and Sciences should be kept separated, as these are two very different scholarly branches.

The combination in many of these cases make solid sense. The move of Visualization is an excellent example. Although I can see definite concerns for moving a marquee program out of a college it is clearly an outlier in their offerings and could confuse their mission to those on the outside especially. The Combining down to a handful of colleges has the potential to create similar confusion about missions making it more difficult for students to search out programs that fit them. There are however potential efficiencies that I'm unable to see and are beyond my expertise and perhaps there is an ability to create prop up support for less popular programs as part of larger portfolios. Moving University Studies to being only available through Liberal Arts is less palpable. The market has dictated that customizable degrees are appealing and limiting the only option we have to somewhat mimic this to only Liberal Arts will very likely have negative impacts on recruitment and more immediately retention of students.

Find # 6 brings up the importance of developing "skills in acquiring, evaluating, and using information" and how vital it is that librarians at A&M continue to teach and expand upon our current programs designed to educate students on these skills. However, the recommendation that we go about teaching these skills by developing a new Department of Library Science and offering degrees in that field, is an entirely different issue. By creating a new Department of Library Science, A&M would need to hire a whole new set of faculty members capable of teaching the many different information science classes needed to obtain a degree. While the University Libraries does have faculty members, they are currently all very busy performing other duties that are vital to running a University Library system and do not have the time nor expertise to teach multiple classes. Instead, the University Libraries have a handful of faculty members in the Learning and Outreach department which focuses on teaching information science classes to students. Currently, they only do presentations by request for professors across campus to teach their classes about the University Libraries and basic information literacy concepts. Going off of the MGT report's recommendation of wanting to teach more information science classes, I believe that it would be a great idea to have librarians teach a handful of for-credit courses that focus solely on information science. Students could take these either as electives or required one-off courses as part of a student's "basics" they take in the first year or two of their education. Furthermore, I do not think that the state of Texas needs another Library Science school. To get a job as a Librarian, most hiring institutions require that the candidate's MLS degree be from an ALA-accredited school, and it can take quite a lot of time and resources for a school to become ALA-accredited. There are already three ALA-accredited schools in Texas and I do not believe that there is enough demand to validate A&M creating a fourth school. Within the field of librarianship, there are also not any jobs offered to those with a Bachelor's degree in Library Science; job levels are determined by either a high school degree or

a Master's degree. There are no in-between positions, so it would be unethical to offer A&M students a degree that they could not get a job with. It is also important that the University Libraries remain a college by itself. The University Libraries operate in a very unique way compared to the rest of the colleges on campus and I believe merging with another college could create quite a bit of problems, both personally and operationally. Most other University Libraries of peer institutions also operate as an independent college, so it is not that A&M is doing anything against the grain. While it may appear odd to some that the University Libraries contain both staff and faculty members though we do not teach for-credit courses like other colleges, there are many different reasons why this is both necessary and important. Part of what makes A&M special is the ability to have small colleges who really know their students - I'm sad that this report looks to eliminate this part of A&M. As a staff member who works with struggling students, they often find their place in these smaller colleges, and flourish there!

Leave the library alone. It doesn't need to be owned by one college. This can lead to problems. I can't see the demand for library science degrees. The Journalism department was closed in the early 2000s. I worked in that department and we were frightened about our jobs when the department was closing. If the department is re-opened there needs to be a commitment of resources, equipment and faculty. University Studies majors need to stay in the colleges and not moved into Liberal Arts/Sciences. Remaining in the home colleges gives the students a place of belonging as well as they are known by their peers and faculty. University Studies is a very important major to TAMU. If there were no University Studies many students would have gone to college elsewhere. Construction Science department needs to stay in the College of Architecture. The department is not an engineering program. Moving it to engineering will fracture it as well as the alumni will lose interest in providing support for the program. Many of the Construction science students left engineering to be in the COSC department.

I have concerns about the increased consolidation of areas of study. In particular, the revenue driving areas are lumped together and those that have weaker revenue streams are lumped together under "Arts & Sciences" -- I am concerned that this unit will suffer from decreased funding and that this will relegate these (very strong) academic areas to second class status.

Recommendation 1: Combine LBAR, Science, GeoSci. The rationale for combining these colleges--doing it because our peers do--is the least compelling rationale of anything in the report. What happened to leading by example and fearless on every front? How will a College of Arts and Science benefit faculty, students, or staff? Simply making it larger does not convey any clear benefits. One theme of the report is to streamline to allow units to focus on their core missions, but this recommendation seems to go in the opposite direction by making their mission be all-encompassing and unclear. This will also bring challenges for faculty promotion and tenure processes where people who are unfamiliar with the wide array of disciplines may measure them against the wrong yardstick. The information presented here was unconvincing to say I'm in favor of such a dramatic change. Recommendation 2 & 9C: Establish School of Visual & Performing Arts/Refocus College of Architecture. The arts are necessary to be a world-class comprehensive university, but separating visual arts from the College of Architecture draws artificial boundaries and fails to grasp what the visual arts are about. The school of visual and performing arts would fit more naturally with the College of Architecture because it would keep our core mission intact. What we do in the College of Architecture is to create, design, build, and preserve the material and non-material culture via the built, virtual, and natural environment. For example, the proposed school has a department of art and design, but it is unclear how this department would be distinct from programs already offered in the College of Architecture, most notably the Environmental Design undergraduate degree. The College of Architecture should be renamed to better reflect our mission and to reduce confusion with the department of architecture. Recommendation 3: Establish a department of journalism. There is no information provided about why a journalism program would be successful this time when it has been closed down once before. What has changed to make a journalism program more viable? Recommendation 9a: Reassign Uni. studies to college of arts and science. To refer to university studies students as those "who do not have the qualifications or interest" (p. 36) denigrates our own students, fundamentally misunderstands this population of students, and contradicts the university's own position for the last several years, which expanded the overall UG population and built-up student success programs to support students who struggled to adjust academically. University Studies-Architecture students are highly engaged—100% participate in high impact learning experiences—and have the second-highest starting salaries of any major in the college.

More discussion and factual evidence is needed to support some of the academic realignments being proposed: (1) College of Liberal Arts, Sciences, and Geosciences into a single College of Arts and Sciences; (2) Establishing School of Visual & Performing Arts; (3) Moving Political Science to the Bush School; (4) Relocating University Libraries within a

single college. I do not see an immediate elimination of three administrative structures into one beneficial to the mission of each college affected by the creation of a single College of Arts & Sciences. Merging very diverse disciplines together will require some of the individual administrative structures to remain in place to lay groundwork to move forward. Additionally, better academic assessment is needed for some departments to ensure quality and performance. Love Performance Studies and bringing back journalism. Need to elevate Africana Studies to a department while we're creating and accrediting new programs.

I am concerned with some of the recommendations in this area. If you take Visualization and Construction Science out of Architecture, you remove its anchors. It will eventually collapse the college. Architecture at A&M has an excellent reputation, and I am not sure why we would jeopardize that. I do not think libraries belong in any one college and should remain independent.

I do not agree with the recommendation that the Biology department should be attached to an Institute...structurally departments should be attached to colleges.

Have Academic Innovations/Disability Resources communicate with IT Accessibility to ensure courses have (being to have/be) accessibility and/or Universal Design integrated into face to face and online courses.

Recommendation 2, to establish a school of Visual and Performing Arts - I am strongly in favor of such a creation. It is strange that TAMU is such a big public institution but neglects applied arts in its entirety. Students assume that a drawing class, art minor, or music major would be available at any institution of higher education and have the rug pulled out from under them during their freshman year when they find out, after committing to TAMU, that those options don't exist here. It's frankly baffling that our students have virtually no opportunity to explore the creative arts here, especially when the arts have been shown to be so wholly beneficial to student development.

I support all recommendations.

While adding more emphasis on arts is important, I do not think that we should sacrifice the level of our science and research departments. The science departments work very hard to secure their funding and be at the top in research. I am not in favor of a reduction in administration. I believe there are probably ways to streamline things and make them more efficient, but reducing administration sounds like a lot of people losing their jobs. With the University being one of the biggest employers for the area, the result would be a hurt community.

Overall the plan makes a great deal of sense, particularly the alignment of the Colleges of Liberal Arts and College of Sciences into one College, which is reflective of peer institutions. As a Former Student of the College of Architecture, and having been on faculty in Colleges of Architecture at other two other Land Grant universities, the proposal to move the Department of Construction Science out of the College will have significant financial, pedagogical, and cultural impacts on what will remain of the College of Architecture. The disciplines of the built and natural environment begin with urban planning and landscape architecture, continue with architecture, and culminate in building construction. This is also true of the project lifecycle in terms of real-world application. I strongly urge you to reconsider. I cannot imagine the blow to esteem and reputation of Texas A&M University to not have these disciplines aligned and within one College. Other SEC and Land Grant institutions are not configured in this way for a reason. TAMU needs to keep with traditions on this front.

I do not think combining all academic advising offices is necessary however, I do think that we should all follow the same lead on when to accept change of major applications. This really needs to be in unison! As a General Studies Advisor that often assists students who change majors, it is difficult to strategize when a student should change majors even when they already meet the change of major requirements for that specific major. Some departments will use these dates to only offer a change of major for the next semester and not the upcoming semester. This really causes many students to remain in our departments an extra semester when they shouldn't have to.

The recommendations to incorporate more performance-based instruction in the fine arts goes directly against directives that were given about 8 years ago to focus on the STUDY of performance, not the act of performing. I believe this had to do with accreditation or something, but we did previously have courses and degrees that included more performance elements prior to that. I was a student from 2004-2008 and can attest to that fact because I originally was on track to be a Music major and took performance/practice courses. I am excited about the prospect of the new School of performing arts and a new performing arts center. Although I do wonder how this differs from our current theatre complex in Rudder. Also very excited about bringing back the Journalism Department, although reasons for shutting it down should be reviewed carefully to ensure we are not reliving history and making the same mistakes. As someone who minored in Journalism because I could not major in it, I would have loved to have been able to take more classes

related to Journalism, particularly in page layout and multimedia.

---

The programs and departments recommended for addition are needed at Texas A&M. Journalism and Library Sciences are critically needed, and have a limited footprint among universities in Texas. Visual and performing arts would add vibrancy to the college, and the community. Other recommended re-alignments and additions seem reasonable.

---

Recommendation to merge the seven Libraries into the newly created College of Arts and Sciences does not make sense because we are a service-oriented organization. We serve every College, not just the College of Arts and Sciences.

Recommendation to create a new Department of Library Sciences under the newly created College of Arts and Science does make sense, but I do think further assessments need to be done. Is it really worth to create a new Department if there is not a high demand for Library Sciences?

---

Combining the College of Science and the College of Liberal Arts sends a negative signal that liberal arts are not important to the university. A&M has worked very hard to establish a strong liberal arts program where many of our departments are very well-respected in their field. We will be doing a disservice to future Texan by erasing liberal arts from A&M and once again embracing our stereotype as an engineering-agriculture university. For example, how will the Liberal Arts honor program function in a College of Science and Arts? We will be sending our best liberal arts students to other universities in Texas.

---

Recommendation #6 calls for the merging of the University Libraries into the newly created College of Arts and Sciences and the creation of a new Department of Library Science. I believe that this recommendation completely undermines the vision and mission of the University Libraries. The purpose of the libraries is to serve the entire Texas A&M University community. By placing the University Libraries under the Dean of the new College of Arts and Sciences you would be sending a message to the rest of the university community that we only serve arts and sciences. More importantly, our budget would be under this dean and could result in the libraries losing its ability to adequately and equitably serve the entire university community.

---

As a former student who graduated with a BA in Communications and a minor in English, I have a strong, favorable viewpoint of the College of Liberal Arts as it currently exists. Making Liberal Arts the catch all for different schools you don't know what to do with doesn't improve the function of the College of Liberal Arts. For example, the College of Science and the College of Geosciences focus on studies very different from the other topics of study in the College of Liberal Arts, so it does not make sense to combine these. Establishing a Department of Journalism may make sense to join into the College of Liberal Arts as would the established School of Visual and Performing Arts (if not being a stand-alone school). Why wouldn't you make the University Libraries part of the Department of Library Sciences if they have similar goals and functions?

---

I'm still somewhat new to A&M and I have noticed that due to TAMU, TEES, and AgriLife submitting their research proposals under their respective organizations, overhead reallocation becomes an issue to enhancing collaboration. Faculty have to carefully negotiate their roles to satisfy upper administration goals while maintaining their relationships with their colleagues across campus. My concern is there may be an unintentional decrease in overhead from research as units are being moved to Engineering and Agrilife. Their research projects will go through their DUNS number, which TAMU

---

Combine Science and Geoscience and leave Liberal Arts alone. In fact, invest in CLA and elevate the college that provides more courses for ALL students than any other college. It already has the lowest paid professors and staff for the entire university and is often treated as the red-headed stepchild of A&M. This proposed move -- combining, stripping out ECON, etc. -- just shows how little the MGT folks understand the concept of a Liberal Education (a supposed hallmark of an A&M degree), and the fact that upper administration would seriously consider this move, shows that they are also uniformed and uninterested in anything beyond STEM and \$\$\$\$\$. Also, do not put all of HLKN into Public Health. What financial sense does it make to take a program with 298 undergrads (Fall 2020) and add to it over 3000 students (1200 Health)? Can they incorporate that large of an influx of students without the students' education suffering? What about the parts of HLKN that do not "fit" under the Public Health umbrella -- Kinesiology & Sport Management degrees, the PEAP courses? How will this affect the faculty, staff and students in those departments? Do not waste the money to establish a School of Visual and Performing Arts. This was already tried and got the University into trouble. Go ahead and expand Performance Studies by adding Visualization and Dance Science, but establishing this type of degree costs a LOT of money and is very expensive to maintain. Is it going to be expected to be self-sustaining? How will it be financed and who will have to "suffer" for this. Do we not already have a Journalism degree under COALS? Take the Journalism minor out of COMM and move it there. The Journalism major was

discontinued due to a lack of numbers. I can't see that the University can support two extremely similar degrees. Leave the Libraries alone. While adding a new degree is admirable, to put the Libraries into a College undermines the mission of a Library which is to be an outside-the-college resource for ALL students, regardless of their major.

---

The library does so much for students and just moving it under a college does not make any sense. The library is a leader in many different technological initiatives within the state, country and worldwide. Movement of the Library staff and faculty just for the sake of a new department and degree would severely harm the ability to maintain leadership within initiatives.

---

This is the area of the report that needs the most evidence to back up the radical restructuring they propose. Unfortunately, there doesn't seem to be very much at all. First, let me address the idea of combining the Liberal Arts, Geosciences, and Science together into one college. As stated by the report, a "larger college structure creates a stronger advocacy for the liberal arts education at a STEM-focused university," but the following sections fail to provide any tangible ways in which this merger would improve advocacy for the liberal arts. What will the leadership of the college look like? Will a certain number of seats in the college administration be reserved for the liberal arts? But let me talk about the libraries. It is not encouraging to me that this report clearly misunderstands both what a university library is and how our libraries function. The libraries at TAMU cover a broad range of disciplines, with faculty that specialize in archives and special collections, medical science, agriculture, and economics. Moving the libraries under the heading of "liberal arts and sciences" could bias the library towards serving the needs of just one college instead of the entire academic community of TAMU. Any real or perceived bias might very well discourage students of other disciplines from seeking out the libraries. This move may also erase much of the technical knowledge that our librarians possess in fields other than the liberal arts and sciences. But our library doesn't just support students and the academics of other colleges; our faculty members perform their own valuable research. Like faculty members whose primary role is in running research labs, our library faculty members do valuable research and specialized tasks to build and maintain a vast collection of knowledge. The report singles out the service function of the library, while ignoring the academic achievements of our librarians. For example, Rebecca Hankins is a renowned and nationally recognized expert not only in the subject area of Africana studies, but also by the Society of American Archivists. Her archival work has been vital to countless research projects, building the university's collections, and increasing the reputation of the university. She is a valuable and treasured asset to this university, but like many of the librarians on staff, much of her knowledge is technical and specific to the work of being an archivist: a niche field that wouldn't translate well into an undergraduate course. And speaking of undergraduate courses, a bachelor's degree in library science is not very useful in the field of librarianship. Most technical positions require a Master's in Library Science, which is a more strenuous degree plan that would require accreditation with the ALA. I find it curious that the report identified OU's library program as a peer institution, when it ranks very low nationally for library and information sciences. A better comparison for TAMU's academic ambitions would be UT's library school, which is ranked 5th nationally. In fact, Texas already has several library schools that rank in the top 20 nationally, and despite their good standings, enrollment is down across the board. UT's Admissions and Enrollment data for the School of Information shows a class size of around 100 students, and while enrollment figures for North Texas and Texas Woman's are higher, they also are less competitive. Why would TAMU expend so much money to enter an already over-saturated market? Especially because the university would have to spend years chasing accreditation and building a reputation. Overall, I believe implementing Recommendation #6 would be a massive and costly mistake.

---

I do not feel that the report considered all of the negative consequences of combining Liberal Arts, Science, and Geosciences. In Geosciences in particular, students often choose to attend Texas A&M specifically because we have an independent College of Geosciences. Also, combining colleges with largely different views of knowledge and knowledge production does not seem like it would be conducive to "elevating Arts and Sciences" at TAMU. A more likely scenario is that such a move causes infighting among constituents for resources, leadership positions, etc. leading to the university potentially having a poor reputation among potential new hires and future students. The report cites "Peer" institutions, but the institutions that are most similar to TAMU in scope, size, and function operate with separate colleges of Arts and Sciences (i.e. Clemson, Michigan State, Penn State, Purdue, Virginia Tech).

---

I'm not so sure about merging Technology Management with Engineering Technology. You can even argue that it bears some resemblance to May's MIS program since it has business minor courses. I think one of the reasons why Technology Management is popular is because it has a lower cost of entry. Moving it to Engineering would scare students away who decided Engineering was not a good fit for them.

I am not sure why MGT did not touch on college of engineering?

Bringing back a true Journalism curriculum must also mean the return of Broadcast Journalism in a technologically advanced society. KAMU, 12th Man Productions and all digital aspects of campus should be aligned as part of a larger communications center. This should be an area centrally located on campus and visibly obvious as a technology platform of large-scale digital production of live and post-production classroom educational opportunities. Live Events, television/streaming shows, content-driven storytelling (documentaries) and hands-on practical experience with real-world application will be a game changing aspect of the student experience at Texas A&M. Every aspect of the digital experience can be addressed and taught: videography, editing and state of the art sound stage production, media for practical classwork that involves audio, lighting, staging, engineering, 3D and motion graphics creative, as well as live event production control room classes to teach the craft of broadcasting in the 21st Century. KAMU's platform is the obvious outlet for distribution of content and events for the TAMU School of Visual and Performing Arts. The home for student productions created by students in Visual Arts and produced by students at KAMU and airing on KAMU can be leveraged not only for a local audience but also a statewide distribution platform with options to distribute nationally via public and commercial media entities. KAMU's large post-production spaces will maximize the storytelling abilities of the best students to help create documentaries on A&M's culture and earn academic credit for their efforts. Combining Liberal Arts, College of Science is appropriate and much needed for a public institution of our scale and influence. Establishing a School of Visual & Performing Arts, relocating the Viz Department and creating a true Department of Journalism are aspects where Texas A&M should lead. Please consider a structure combining all the available elements in a formidable (and existing) TAMU arsenal: KAMU, 12th Man Productions and the Visual & Performing Arts School. It's a rare opportunity to bring all aspects of content creation together to create an approach unparalleled in American higher education – serving our burgeoning student creative population while creating a storytelling hub that is unmatched. The two key components should be KAMU and 12th Man Productions, as both are equipped for storytelling in the 21st Century. 12th Man Productions and KAMU have the linkage (in both physical proximity and a common storytelling vision) to benefit students in a way no other school can. Currently, students working for 12th Man Productions get unrivaled experiential learning in broadcast live event technical and production, yet do not do so in an academic setting. KAMU has begun offering the same opportunity over the last couple years. In both areas, students are prepared for full employment in national networks, similar to what our Viz students get – but without fanfare (no one seems to understand this is happening).

I have had an association with the Technology Management program since 2009. The roles that I have filled with the program include online course support, learning space engineer, instructional designer, curriculum developer, and adjunct instructor. I could provide and did write a relatively complete history of the program, but it is best to focus on the program beginning in 2013. In 2013 plans to revamp the program began under the leadership of Dr. Fred Nafukho, EAHR Department Head, and Dr. Becky Carr, Assistant Dean for Finance and Administration. The goals of the program overhaul were to increase the rigor of the curriculum, build an on-campus facility dedicated to the Technology Management Program, and recruit students directly to the program rather than rely on transfer students. The restructuring of the program was also seen as benefitting more widespread efforts to recruit and retain first-generation students and students from traditionally underrepresented groups and address the goals of the Texas 60 X 30 plan. NOTE: the Texas 60 X 30 plan was not officially released until 2015, but much of its direction and content was known during this time. In the fall of 2013, three rooms (two classrooms and one large shared office) were identified as spaces that could be combined to create one large facility for Technology Management. I was charged with creating a learning space that had a "wow" factor and supported many teaching styles. At this time, TCMG students took their technology-intensive courses at Blinn, which meant that the college lost the bulk of the revenue from these courses. We wanted our students to have an on-campus home they were proud to showcase to others, and we hoped that this space would attract top faculty members. The chosen design allowed active learning techniques to be easily employed as it encouraged "hands-on" learning opportunities. The Technology Management lab opened in the spring of 2015. During the renovation of the learning space, one full-time faculty member was hired to lead the program. Several highly qualified potential adjunct instructors were identified and consulted on curriculum changes. The goal of the curriculum changes was to emphasize the human intersection with technology which would clearly distinguish Technology Management from other programs at Texas A&M University. TCMG graduates would have the knowledge and skills for careers that helped others utilize technology resources. The reworked curriculum also emphasized the importance of certifications in technology fields. Technology Management students had the opportunity to either start or complete

certifications in the following areas. ITIL (Information Technology Infrastructure Library) Foundation Certification Project Management Professional CCNA (Cisco Certified Network Associate) Microsoft Certified Trainer Google Cloud Management The changes with the program in conjunction with the full utilization of the Technology Management lab led to program growth. The lab capacity was expanded from 32 to 48 students during the summer of 2018. Another positive trend that was experienced during this time was the growth in the percent of first-generation students and students from traditionally underserved populations. This percent increase was particularly impressive when comparing the percent of these populations in technology-related industries. The fall of 2018 brought changes to the Technology Management Program. A new department head was already in place, and several new faculty were hired due to faculty departures and program growth. There were curriculum changes during this transition which I believe were not beneficial. The most significant change was moving away from the "hands-on" learning experience in favor of virtual experiences. The department head at that time supported these changes, with the justification being that "hands-on" experiences projected a "trade school mentality" that was not appropriate at an R1 institution. Further, the opportunity for students to earn certifications during the program diminished with a similar justification that certificates evoked "community college programs." All equipment necessary for gaining first-hand experience and earning certificates was removed from the lab, and it is basically a standard computer lab now. The curriculum was also changed, which shifted the program's focus from the human interaction with technology to managing virtual applications and systems. For example, before this change, students in TCMG 272 learned skills necessary to operate an IT help desk, including basic troubleshooting, communication skills, developing support documents, understanding accessibility needs, documentation, budgeting, and a brief introduction to IT project management. TCMG 272 is now a coding and programming class. This change is indicative of other changes which blurred the distinction of TCMG with other programs on campus. In my opinion, the most accurate description of the current program is "computer science and engineering lite." To sum up my feelings on whether or not TCMG should be a part of the College of Education and Human Development or possibly move to Engineering Technology, I believe that TCMG should move to Engineering Technology if it remains in its current form. The program no longer has the unique characteristics that it had from 2015 through 2018. The lab will soon require updates which I am not sure can be justified since it is not being fully utilized. In fact, the former department head suggested that the lab should be moved to a smaller space or decommissioned altogether in favor of creating a "traditional" classroom. If the program remains in CEHD, it must go back to emphasizing the unique characteristics that brought it a brief period of notoriety and success from 2015 - 2018. If TCMG moves, perhaps CEHD could offer a minor focussed on those unique experiences that center on human experience with technology.

Page 30-31, 36 and 125: The College of Veterinary Medicine & Biomedical Sciences has strong collaborations with TAMU Health Sciences Center (including the Dept. of Neuroscience and Experimental Therapeutics), as well as institutions such as M.D. Anderson Cancer Center, Baylor College of Medicine, and others. The Biomedical Sciences undergraduate program is a leader at TAMU in attracting students interested in veterinary medicine, as well as the medical professions supporting human medicine. Additionally, BIMS educates students interested in biomedical innovation and discovery through, for example, the Biomedical Research Certification, and global service through the International Certificate in Cultural Competency and Communication in Spanish (Spanish Certificate). Furthermore, the College of Veterinary Medicine & Biomedical Sciences has an Assoc. Dean for Global One Health, acknowledging the role of colleges of veterinary medicine in translational medicine and human health, in addition to animal health. The report relies heavily on the pre-veterinary aspects of BIMS. How will the One Health aspect of the BIMS education be maintained, should it be moved to an Institute of Biological Sciences? The management report places the Dept. of Biology and the Biomedical Sciences Program together in an institute. Given the foci of the biological sciences on campus, would the vision be to also include public health, allied health, biochemistry, nutrition, entomology, animal science, etc. together, recognizing the interconnectedness of these disciplines to one health? The Biomedical Sciences Program, in part, thrives because it is a program under the Dean's office, rather than in a department. Unlike moving specific departments, as recommended elsewhere in the report, the BIMS program is taught by faculty in five departments, many of whom teach in all three levels of education within the college. This fact is a recruitment point, and major strength/difference, as compared to other biological sciences programs. While the report compared biological sciences at other campuses with colleges of veterinary medicine, it did not compare our undergraduate program to the only other college of veterinary medicine with an undergraduate BIMS program: Colorado State, or similar programs in colleges of medicine: The Ohio State University and Marquette University. How will the faculty that teach in the undergraduate BIMS program be assigned to departments, given teaching loads, and assigned resources (example:

laboratory space for the BIMS cornerstone courses with laboratories: Biomedical Anatomy, Biomedical Physiology and Biomedical Microbiology), etc.? How does movement to an institute change the educational paradigm for BIMS? (vs. other in-state Biomedical Science majors at Texas A&M Corpus Christi, Sam Houston State University, and UTRGV, or other biological sciences majors) The report refers to facility renovation for the biological sciences institute. Please see the above comment about resources, given the CVMBS has state-of-the-art teaching spaces. The report addresses the idea of a biological sciences meta-major. ("A unified biology program with tracks.") The biomedical sciences program, biology, neuroscience (two areas of concentration between the College of Science and the College of Veterinary Medicine & Biomedical Sciences), molecular and cellular biology and zoology, do not fully encompass the depth of biological sciences on campus (see above), which also include animal science, entomology, etc. What is the vision for the institute to include other biological sciences? Could intercollegiate programs such as exist for genetics and toxicology, as well as institutes such as TAMIN and Borlaug be more appropriate models? Could a biological sciences meta-major be envisioned with centralized advising for lower level/FTIC students and then choice of a major, rather than tracks? I have a concern that moving only Biology and BIMS to an institute does not facilitate moving students between tracks or majors as students explore their talents through the college experiences. Based upon the modeling, where would the undergraduate advising office for the College of Veterinary Medicine & Biomedical Sciences be housed? Where would the undergraduate student fees/differential tuition relocate? The Associate Dean for Undergraduate Education is part of the dean's executive staff in the college and is not ad-loc'd to a specific department, given the interdisciplinary nature of the major. As such, the advising office is also part of the dean's office, rather than an individual department. How would development (scholarships, etc.) be affected for the undergraduate majors in the biological sciences? BIMS, in particular, is a 50-year-old program with strong ties to the College of Veterinary Medicine & Biomedical Sciences. Is there a development plan that could be in place, should a move be made? University Studies is addressed elsewhere. However, the report does not address the neuroscience undergraduate degree. What is the vision for these students? (Page 36, Recommendation 9) The university studies degree has concentrations in each college. Does the vision of moving the major into a single college change the goal of the degree? In addition to being able to put various combinations of areas of concentration and minors together, the degree plans make available the faculty expertise and college experiences of the individual colleges in which the areas of concentration are housed. Would administration of the degree from a single college detract from this? What is the vision for the advising structure, given the need for ties to various departments on campus? The report refers to the university studies degree as having students "who do not have the qualifications or interest to enroll in a college degree program." I do not believe this is inclusive of the scope of students in these areas of concentration, many of whom are academically strong, honors-level students. (page 36 #9b): Please see above with respect to the interconnectedness of the teaching in the CVMBS. Would removal of the Biomedical Sciences Program lead to duplication of efforts, teaching facilities, etc., if the program is to remain fundamentally the same?

Recommendation #6 states that the University Libraries are to be moved to a newly-created College of Arts and Sciences and that the head of the University Libraries is to be given the title of Associate Dean. This recommendation is contrary to the consultants' own statement in the Library Peer Institution Review section of Appendix 3: "In a review of fifty land-grant universities, the chief administrative leadership of university libraries is heavily represented by deans or titles with Provost." Placing the University Libraries within the College of Arts and Sciences implies that the Libraries only serve that College and not the University as a whole. The report also recommends that the current faculty-librarians of the University Libraries teach library and information courses as well as serve as faculty in a new academic Department of Library Science that offers degrees in these subjects. Universities with existing library schools are not organized this way with faculty serving dual roles, including the consultants' own example of the University of Oklahoma (OU). It is true that the OU School of Library and Information Science (headed by a Director) is within the College of Arts and Sciences and the School does teach academic courses in the subject areas contained in its name. However, faculty in the School are not involved in the operation of the OU University Libraries. Instead, the University Libraries are headed by a Dean with faculty of their own, functionally and administratively separate from both the School of Library and Information Science as well as the College of Arts and Sciences. A peer institution within the state of Texas is The University of Texas at Austin (UT), whose School of Information is the academic unit teaching courses in library and information sciences. Similar to OU, the UT academic unit is also physically and functionally separate from the UT University Libraries. The UT School of Information is headed by a Dean while the University Libraries are led by a Vice Provost. As for A&M creating a new degree-granting department in library science, three American Library Association-accredited programs already exist in the state of Texas. The report did not mention any studies or analysis supporting

the feasibility of successfully recruiting faculty and students for a fourth such program in the state.

---

Pg. 30. Recommendation #5: Create the new Institute of Biological Life Sciences which will contain the Department of Biology and the Biomedical Sciences Program. Would this move include the Biomedical Sciences programs at the College of Dentistry? Pg. 31-32. Recommendation #6: Merge the University Libraries into the newly created College of Arts and Sciences and create a new Department of Library Sciences. 1. Would this include university libraries already affiliated with other colleges in the university such as the Medical Sciences Library, the Baylor Health Sciences Library, the TAMU Galveston Library, or the Law School Library? 2. Not all librarians in the University Libraries have faculty status and even those that have faculty status may not be used to teaching, especially teaching a full college-level course, rather than basic one-on-one or single classes. 3. There is a suggestion in this finding/recommendation that a BA in library sciences should be created. The reason there are not many BA in Library Sciences programs in existence is that they do not lead to job opportunities in the library field. All librarian positions require a master's degree (MLS, MSIS, or MLIS) and usually 1 or more additional degrees in another field. Students graduating with a BA in Library Science would not be eligible for positions in their field. This type of program would be a waste of their time and money. I think you should just integrate Information Sciences undergrad courses into already existing degree programs and not add a full undergraduate degree. I think there are plenty of other programs that money and effort could go towards that would be worthwhile and have more growth potential than a Library Science BA program. Anyone with any knowledge of the library science field would know that a BA program is a worthless endeavor. That said, a PhD program might be worth discussing with the ALA Office of Accreditation. 4. There is also a suggestion to create multiple learning commons in university library spaces. Would this include the university library spaces in Galveston, Qatar, Ft. Worth, and Dallas? Pg. 33. Recommendation #7: Implement recommendations from the Texas A&M Health Administrative Organization Structure and Budget Assessment To the best of my knowledge staff did not have an opportunity to comment on this report. Will Texas A&M Health students, faculty, and staff be given the opportunity to respond in any way to this report? Pg. 34 - 35. Improve research organization at TAMU-Health. Grow interdisciplinary basic and translational research within Texas A&M Health and in collaboration with health-oriented researchers across Texas A&M with an emphasized imperative of building capabilities for clinical research and commercialization. This section does not address research from Texas A&M Health being done outside of Bryan/College Station and Houston. Does this include the research at the College of Dentistry?

---

I believe the Academic Realignment section contains both positive and extremely negative recommendations for the university. Positive: - Creation of a School of Visual and Performing Arts: I believe it was a critical mistake of former Texas A&M administrators to gut these departments and degrees in the last decade, and it would make me proud to see them return to campus in an even larger role within the College of Liberal Arts. It also make much more sense to house Visualization within this school, rather than in Architecture. - Establish a Department of Journalism: This is another fantastic idea that the report brings forward. I believe it was a mistake for the university to do away with the department in the past, and that has resulted in Texas A&M falling far behind its peers who put emphasis on journalism. - Refocus the College of Architecture on Architecture and Landscape/UP: This is a fantastic idea and streamlines the college while focusing on the essence of their purpose. Negative: - Combination of the College of Liberal Arts, the College of Science, and the College of Geosciences to create the College of Arts and Sciences: I believe this is the reports largest error and would harm students and lead to much frustration among faculty/staff. I work daily with students across the university and I consistently hear members of different colleges sharing very different opinions of the university. Engineering students believe they are just a number and that the university doesn't care about them as individuals, while Geosciences students (for example) believe they are valued and love their experience at TAMU. The main contributing factor to this is the size of their college and how the university manages that. The other glaring issue with this is that it combines departments, majors, buildings, and areas of campus together that have no relation to each other. I believe the report is incorrect when it states that this will create stronger advocacy for Liberal Arts, but it does seem clear this decision would be made for "cost savings." I implore Texas A&M leadership to rethink this. Having more, distinct colleges leads to closer knit communities, deans who are less overwhelmed than a single dean leading 100+ majors, and students who don't just feel like a number at such a large university. - Merge the University Libraries into a college: Reading this recommendation makes me believe that the writers of the report didn't fully understand what the Texas A&M Libraries is, exists to do, or how they are structured. I believe they should exist fully outside of any college and maintain their own dean. The Libraries is home to general libraries for all majors, a library specifically for Medical Sciences, and one for Business students. First of all, the libraries do much more than is entailed in this report. Secondly,

while I believe a Library Sciences degree (like UT has) would benefit Texas A&M, but could exist without this reorganization. It is also confusing that Texas A&M would offer a bachelor's and Ph.D. in this, but not a masters. This in addition to the redefinition of position titles could all be achieved without reorganization of the Libraries, and comes across sounding like these recommendations were all determined after deciding that the Libraries should be placed under a specific college. This recommendation as a whole disregards the great collaborative model University Libraries employs, the fact that the Libraries are used by students of all majors, and any risk that this recommendation could result in. It feels like a reduction of the Libraries to save money and employ one fewer dean.

Reading the MGT report I can see the benefits of the proposed academic realignments. I am especially excited for the creation of the school of visual and performing arts. I believe it would be a great benefit to the university and the state of Texas because if you want to study fine arts in Texas you only have two options, University of Texas and barely University of Houston. However, before resources are given to the development of this initiative we should focus on the undersourced resources of current programs. I do believe the comments collected during this session will be important but before any academic realignment is completed, I think a deeper dive needs to be conducted into each of the proposals within the MGT report to ensure they are truly viable or if they make sense at the university.

None at this time

Makes sense. I know LSU went through a similar consolidation.

Again, I support the idea of creating a more balanced Texas A&M.

This is asinine. Since when do sciences have anything to do with the arts? Implementing this recommendation would damage TAMU's reputation as a school where STEM is a high focus. Science is science, and arts are arts. Like oil and water, this should not happen.

Combining Geosciences with Science makes complete sense. Combining Liberal Arts with Sciences would create a behemoth that the needs of individual students would be lost in. Bigger isn't always better. Visual & Performing Arts is a good idea; this is an area we are weak in. And it makes sense to move Viz to this area and even expand this program if possible. Increasing the size of the Journalism department is also needed. Moving Political Science to the Bush School makes sense, but moving International Studies there ignores the other "tracks" that these students can choose from, for example international business. Construction Science should remain firmly rooted in Architecture. They are not a fit for the College of Engineering; this would not serve anyone well. It makes sense to get all of the biological sciences together under one roof, and the College of Science makes the most sense.

I do not think it makes sense to recreate a Journalism Department for the few number of student it would benefit. This was the reason the Journalism major was discontinued a number of years ago. Additionally, we have an Ag Communications and Journalism degree that could serve the same purpose that already exists.

I am baffled by some of the recommended consolidations. I would defer to faculty, staff, students, and leadership in those colleges affected by these recommendations.

Recommendation #6: Merge the Libraries with a newly created College of Arts and Sciences. Response: MGT Consulting does not understand the role of academic libraries (or librarians). I am hoping that Dr. Banks does. The A&M Libraries support academic success for EVERY student in all majors. It is more than just a building to study. A&M Libraries' librarians teach information literacy sessions to thousands of students each year. Perception is reality. For example: I spoke with an electrical engineering student last week and told him of the recommendation to move the Libraries under the College of Arts and Sciences. His response: "Does this mean that engineering won't have access to the library anymore?" And he was a sophomore. How confusing would that be to a freshman?! Rationale #6: Creation of Dept of Library Sciences. If this happens, I'm glad that Mr. Sterling C. Evans won't have to witness this. He did so much for not only A&M but for the University Libraries. He donated the majority of his estate to make the libraries better. He created the Friends of the Libraries and was the first president. He championed libraries because he knew that the library is the heart of all institutions of higher learning.

I am excited to hear about the recommendation for a Department of Journalism. Although I support investing in a Small Animal Hospital, focus should still be placed on Large Animal practice as well. As stated in the report, a USDA report emphasized the need for Large Animal Veterinarians.

Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. As a former employee of Liberal Arts, and former student, it was extremely difficult to compare our

college to other institutions. Texas A&M is STEM heavy and the current structure prevents collaboration between the arts and sciences. Combining these colleges would lead to more collaboration and shared services, especially those in the advising community. This was not mentioned in the report, but the office that assists students with the change of major process is typically handled in this organization as well due to the high volume of students changing their major from a science-based program to one in liberal arts. This reflects on the need to pull all university studies programs to this one college as well. Recommendation: Establish a Department of Journalism This department was home to over 970 majors back in 2001. In two years the college closed the program. Telling a story/viewpoint is one of the most important skillsets in today's society. Why did the college never support re-establishing this degree program?

---

I think the academic realignment proposed is great. I always thought it was strange that the Department of Brain Sciences was not in the College of Science.

---

My comments are in regards to comments made under Finding #5. Firstly, I found that the comments made about the Department of Biology were either vague, untrue, or both. 1. "...there is a perception that the current Department of Biology is underperforming and there would need to be a significant investment to bring the productivity to an acceptable level." This section is particularly problematic. No description of the metric used to make the determination of "underperformance" was provided, so this seems to be an assessment that is, at best, hearsay. Mere perception is not sufficient cause to justify the conclusion, and I see no hard statistics that indicate that the department is anything but exceptional. My time in the department of biology has revealed nothing to me, excepting that the research is well-funded, the research is highly productive, and that the undergraduate students are receiving a rigorous and complete education. The funding that the department brings to the university is more than adequate. Moreover, as the department continues to hire talented and capable individuals during its expansion phase, it will continue to establish itself as a top-tier program in the country. 2. "Most peer institutions do not have a stand-alone biology department, but universities do offer microbiology and other specialized biology programs." I am a bit perplexed by this statement. In fact, I went through the list of Peer Institutions provided in Appendix 3, and through simple Google searches, found that 75% of these institutions have thriving and successful departments of biology, biological sciences, or related: Michigan State University Department of Integrative Biology North Carolina State University Department of Biological Sciences University of California, Berkeley Department of Integrative Biology University of Florida Department of Biology University of Michigan Departments of Ecology/Evolutionary Biology & Molecular/Cellular/Developmental Biology University of San Diego Department of Biology Clemson University Department of Biological Sciences Duke University Department of Biology Pennsylvania State University Department of Biology Purdue University Department of Biological Sciences University of California, Davis College of Biological Sciences University of Georgia Departments of Biochemistry/Molecular Biology, Cellular Biology, Genetics, Microbiology, and Plant Biology University of Maryland Department of Biology University of Minnesota College of Biological Sciences Virginia Tech Department of Biological Sciences Thank you for your time and consideration.

---

Bold. Innovative. High-risk/High-reward. Should many of the vision aspects be decided to move forward, I would encourage strong consideration for the intentional plans that would support sustainable growth for such action. For example, merging multiple disciplines and programs may join in name only. Creating environments that encourage discipline integration is necessary from a funding perspective, as well as where the world is going for future graduates at all levels. Degree plans are impacted. Curriculum/Programs are impacted. Accreditation is impacted. Collaborations are impacted. Who and how can contribute to resolve, address, and ultimately grow this bold environment? I believe it can be done but stress thoughtful and deliberate design, rather than quick action.

---

This is just another PR piece as the top power structure at A&M is too tightly linked with the current dominant conservative rulers in the Legislature who appoint the Board of Regents. I would bet consultants were directed to get rid of the term "Liberal Arts" and this is the result. The realignment shows the total lack of understanding of how various academic disciplines are defined and how they differ. The consultants appear to be either failed academics or don't care enough to obtain the necessary background to do a thoughtful design. Other universities have also read the report and have already started to send letters of job offers to top academics in the altered departments. If you want take A&M backwards to where it has a academic standing far below UT the realignment is a terrific way of accomplishing that task.

---

Although it may be difficult because the vast majority of university professors are not just left of center, but increasingly extreme left, I think A&M would stand out to many seeking a balanced education if more faculty that was center and right of center were hired. A&M is unique, but will not remain so if it just "follows the crowd."

Finding #7 – Agreed relationship between TAMU Health and TAMU are bureaucratic and just confusing. When following standard rules of even merit implementation, we are advised by Health to follow TAMU rules only to find out they fund and approach items differently, and sometimes schedules end up being a little different. I hope the recommendations include complete uniformity. Under the Finance and Business Administration org. chart there is a box for HSC, which doesn't seem to help in resolving the ongoing issues and mix of communication.

---

Placing the Libraries under the College of Arts and Sciences will result in the Library no longer being able to maintain its mission of providing services to all colleges equally at TAMU. Over time the natural tendency will be to keep those closest and in your direct reporting lines happy. I can easily see the College of Arts and Sciences getting more specialized attention while other colleges suffer.

---

I support the suggestions in the report

---

This may need some adjustments but too much consolidation may

---

I feel strongly that HLKN needs to be its own school or college under the Health umbrella versus added into another college.

---

I read that one of the recommendations is to place the University Libraries under the proposed College of Liberal Arts and Sciences. The University Libraries should not be relegated to just one college. The Libraries are a unique hub that serve the entire campus. Placing it under a specific college and then creating a Department of Library Science when there are already three to four successful and well-known competing Library Science Schools in the state of Texas is ridiculous.

---

Recommendation #1: NO, I do not think that combining the Liberal Arts and Sciences in a single college is really possible: students, faculty and staff and specific domains and interests are too different or even antagonistic in between these two entities. YES, combining Sciences and Geosciences in a single college could be done in my opinion.

Recommendation #3: Establish a Department of Journalism: YES Recommendation #6: Merge the University Libraries into the newly created College of Arts and Sciences and create a new Department of Library Sciences: NO, libraries are not properly speaking neither arts nor sciences. Recommendation #9c: Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning: YES.

---

I hope and pray that Texas A&M will one day "establish a School of Visual and Performing Arts with new departments in music, performing arts, and fine arts." I strongly believe it will attract a wonderful, talented, and diverse set of students and thoughts from across the country and the globe as well as be a positive addition to the Aggie community and the great state of Texas as a whole. I have promised myself that when TAMU opens a School of Visual and Performing Arts, my goal is to be that college's first student.

---

I concur with the recommendations of the study

---

Recommendation 1 and 2: I agree with these options, and although it would be sad to see Visualization leave ARCH, I think it would be a great opportunity for the program to grow. The one thing I would note for this is that the main Graphic Design offerings at TAMU are through the Art minor in the Department of Visualization. These classes have not been available to students as much in the last couple of semesters, but there was always a lot of interest in Graphic Design, both during my time in ARCH and in ENGR as well. I would recommend either 1.) Growing the Art minor or 2.) Offer a Graphic Design track within Visualization separate from animation/game design to further serve students interested in this profession. Recommendation #3: Going back to my undergraduate experience, I changed majors from Telecommunication Media Studies in the Department of Communication to Agricultural Communications and Journalism in the College of Agriculture, because instead of communication theories, we took writing, editing, PR, magazine, radio, basic design for the Adobe Creative Cloud, had internship connections with the Houston Livestock Show and Rodeo, and a lot of scholarship options in the department. While there was not a Journalism degree while I was an undergrad, I believe many students interested in different areas of Journalism find AGCJ a great option to gain Journalism skills at TAMU. For Recommendation #4, I definitely agree with growing the Bush School and it's connection to the Department of Political Science. For Recommendation #5-#8 I don't believe I have enough background knowledge of these programs to form a meaningful opinion. For Recommendation #9a, I disagree with this recommendation for two cases in particular: University Studies in Architecture and University Studies in Business. Both of these majors allow students who transfer with higher numbers of hours, lower GPAs, or diverse life experiences such as being a non-traditional student with a family, etc. an opportunity to earn a TAMU degree with a concentration in the career areas they are interested in.

Whether they were not doing well in the first major they were in, weren't accepted to a first-choice major, needed more of their transfer hours to count in an elective section, or simply wanted more choices for coursework than more restricted degrees provide, the University Studies degrees serve a strong purpose on campus to many of our students, some who may not have completed their degrees if it weren't for these programs. Recommendation #9b I don't know enough about these programs. Recommendation #9c: As a former advisor in ARCH, a current advisor in CVEN, and the older sister of a COSC graduate, I disagree with moving Construction Science to Engineering. My reason is simple: Construction Science students do not want to be engineers. As one of the best veteran-serving majors at Texas A&M which even includes an accelerated program, this major cannot be funneled through General Engineering Admissions and remain successful. The students who choose COSC do not want to take the first year of Engineering courses. PHYS 201 and MATH 140/142 prove challenging enough for the jobs they want, and based on the job placement for these students after graduation, this model is working. For many students I met in this program, including my brother, they love construction project management but would have never submitted an application to the College of Engineering. For #9c I do not have enough knowledge of these programs to form a full opinion.

As a former student, class of 1993 and liberal arts major, combining liberal arts and the sciences into one gigantic college feels like a step in the wrong direction. Just based on personal experience, back in the 90s I felt lost at this large University and could have used more individual attention as a student. Making the college even larger might increase our stature on a list of the largest colleges. My question is, should that be the priority? I worry about the impact on individual students by turning an already large college into one this massive and that students like myself will get lost in something like that.

The College of Liberal Arts and the College of Sciences are relatively large and individually unique. I do not agree with consolidating these colleges. I can agree with consolidating GeoSciences with the College of Sciences.

Is the goal here to "do what they do?" or are we really hoping to actually save money? How much savings will be eaten by the merger process itself? It seems this is a case of "doing something" and doing "what those guys do" seems to not be a goal in itself. Is adding new programs for Dance, Vocals and Performing Arts really in line with the intention of a school known for its Mechanical and Agricultural base? Is the community served, and in that the money the community spends, best served by trying to duplicate the efforts of other schools? You have finite money. How many slices can you add to that money for new functions that are not part of the school today? How is the school benefited by adding yet another place to spend money. Are we better served by doing "what we do" better than doing things we have not done before?

In my opinion there is no need to make changes in the academic structure and realignment. However, new faculties and/or departments may be established as necessary

None

The rationale to combine colleges appears to be sound, however I disagree with combining Liberal Arts, Science and Geoscience colleges. It makes more sense to combine Science, Geoscience and Biomedical Sciences. Moving Visualization out of Architecture is a HUGE mistake. Providing more funding and space resources to Architecture make more sense. I agree that the creation of a School of Visual and Performing Arts is a good idea, but this should be housed within the College of Liberal Arts. YES, establish a department of Journalism, fantastic! This will pair well with the School of Performing Arts in the College of Liberal Arts. A new Institute of Biological Life Sciences should be housed within the College of Science. Once again, I disagree with combining Liberal Arts, Science and Geosciences. A new Dept. of Library Sciences should be housed under the College of Liberal Arts, which should NOT be combined with Science and Geoscience. I totally disagree with only offering University Studies within Liberal Arts. University Studies is an important program for transfer and re-admit students who show promise and for academically struggling students. This major should be available in Liberal Arts, new expanded Science, Business and Architecture. Removing Construction Science and Visualization from Architecture is a mistake. Architecture has created and built Visualization into a star in A&M's crown, it should be left in the hands of the college that built it from the ground up. Additionally, Construction Science is not a major that should be included within the College of Engineering. This appears to be an effort to create opportunities for Engineering graduate students earlier and does not benefit students. I agree with moving Health and Kinesiology to the School of Public Health. Technology Management does not belong in Engineering, this major should be moved to the expanded College of Liberal Arts.

When it comes to the recommendations regarding Performing Arts, TAMU used to have dedicated Music, Theatre, etc. programs. The issue that arises with these types of programs is the lack of a need for performers. Henceforth, the

department of Performance Studies was created that put an emphasis on research as opposed to being a performer. I am currently a staff member at TAMU, but before that I was an Undergraduate Student within this department. While I have always been of the opinion that people should invest more into the arts, there is a reason why many of these departments are smaller. There is not as much of an interest at this school in the arts. People come to Texas A&M University for programs such as Engineering, Agriculture, etc. not for Dance, Theatre, Music, etc. I'm not entirely against this recommendation as there is benefits in the restructuring. The degree programs should remain mostly untouched however as, in the case of Performance Studies, there is a reason behind it's current state. Part of the appeal to Performance Studies is the freedom to focus on the discipline of your choice. Because of it's flexibility, a student could do any combination of disciplines without being confined to just music, just theatre, etc. When it comes to performance there needs to be this interoperability between disciplines that Performance Studies allows for. From my understanding, Journalism is something that the school had at one point as well, but was abolished for similar reason. It just didn't work at this school.

Strengthening the influence of the colleges of Liberal Arts and Science by joining them appears to be a good thing on the surface. As far as Performance Studies and Music classes, MGT just moved the biggest ensembles in Performance Studies to Academic and Strategic Collaborations, and therefore removed funding. TAMU has attempted before to have a school of Music and it did not go well, hence the underfunded and slowly dying department of Performance Studies. TAMU doesn't have to have what everyone wants as a major, especially when other system schools, such as Commerce and Kingsville, do it well. However, music technology, sound engineering, video production would all be good things to pursue, as they would tie into the strong science, technology, and engineering programs we already have. TAMU has had a department of Journalism as well, and since it was not popular, it was ended as well. As with the School of Music, this seems to be an attempt to solve a problem that does not exist. The Bush School has always been rather independent, but collaborating the with Political Science does make sense. The Biological Life Institute seems like it would solve some problems. The Libraries, however, really should remain independent of colleges. They need to be able to serve all colleges without campus politics. Degrees in Library Science would be best in the College of Education. Moving Undergraduate Studies to Arts and Sciences makes sense, as does investing more in Small Animal Hospital. The recommendations for the College of Architecture make sense to me.

There was no mention of Mays business school which I would assume has a very big impact on TAMU.

A COAS is successful at small institutions, but full of problems for a campus (and college/s of this size). It is insane to think that a biologist and a historian (for example) will have the same needs and goals, not to mention be understanding of each other's needs. Moving forward with this plan in full is bound to infuriate former students and donors and will result in loss of funding. CVM includes undergraduate classes taught across the university that are required for degrees in several colleges. There is no physiology department outside of CVM and it is important that their faculty continue to be allowed to teach undergraduate courses.

I agree with the proposed restructuring, but am unsure of the Dept. of Visualization moving from College of Architecture. Dept of Journalism was shut down years ago, why? Need to understand why it was shut down then and why it is needed now.

While I think a lot of this is great, I don't really think combining Arts & Sciences is the way to go. Just because some other schools do it does not mean it is the best way for us to do it. I do believe that some departments should be moved around to better align what they are/what they do, but I don't think combining them all is the way to go. Why would putting English and Chemistry in the same college is an improvement? And if you take Visualization out of Architecture, why not put the other departments in that college in with Engineering?

Who is the audience who will be impressed by the combining of the LA, SC, and GEO colleges? I know in theory it would be that we would be more like peer schools, but I don't think that is a significant factor when students are making a choice (is this major a part of a REALLY big unit at the university). I totally understand that it sounds impressive and like it is combining resources, in terms of how TAMU presents itself to the world, but it is a tough sell to students who like the idea of having a smaller unit more in line with their own needs. I am a big arts person, and like the IDEA of having the Performing/Vis Arts as a school, but if we are having to answer questions to parents of "will my kid get a job when they graduate?", this is a REALLY tough road to go down. I myself have a Masters in Library Science from UNT. There is also UT for that, and Texas Women's. While i COMPLETELY think skills in information science should be taught, there are not a LOT of jobs for library science majors.

(n/a)

I agree that a new Small Animal Hospital is needed. We have a great vet program that has been neglected and needs to be built back up, and highlighted.

The College of Education produces the majority of teachers for the State of Texas. I feel it is a slap in the face to downgrade our usefulness by merging us with colleges that have nothing to do with what we do. We also partner with communities large and small, underserved communities on the border and in large cities. Our outreach is felt across the state and country. I am not surprised that HLKN is being moved as it is the biggest department and makes the most money. Not sure what HLKN gets out of the deal but Public Health will get state of the art facilities for research and brand new buildings. Not a bad deal.

The central advising office scares me for all future students. The nuances of advising for different colleges/majors I feel is something that is easier learned at the lower level vs trying to consolidate all of those people together. I would also be worried the students would stop becoming "known" to their advisor & become just another number - thus losing any trust they had in that person.

Biology is a hard science in the same way that chemistry and physics are hard sciences, and belongs within the college of science, or the college of arts and sciences. Removing biology from the college of (arts and) sciences weakens the department of biology both in terms of academics and in terms of research. Aligning biology within agriculture risks making the biological sciences into simply applied biology in service of agriculture. For the department of biology at TAMU to grow and thrive, it is important that it be seen as the hard science that it is, and not merely be put in service of another entity.

Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences At times, the Galveston Campus is linked under the College of Geosciences. How will this merger impact our campus? Recommendation #6: Merge the University Libraries into the newly created College of Arts and Sciences and create a new Department of Library Sciences. The recommendation seems like an obvious train wreck waiting to happen. If the budget line for the University Libraries is housed in this new college, how do those of us outside the college make sure equity is given (especially for our faculty, student, and staff researchers). Transparency is going to be an issue with this type of reorganization.

In my opinion, the libraries should not be housed in/controlled by a single academic unit due to the possibility of preferential treatment to that unit's needs over others. Recommendation 9c - as already one of the smallest colleges on campus, there are concerns that removing both Visualization and Construction Science from the College of Architecture would eventually choke out the remaining programs due to lack of funding. While I can see the argument for Visualization moving to the proposed arts school, I've heard fervent arguments for keeping Construction Science as is. Being part of such a large college as Engineering, it could be dwarfed and see reduced interest/recruitment, as well as the loss of donors that prefer to give to smaller programs.

Please pursue combining the Liberal Arts and College of Science to include more liberal arts education opportunities. This would increase inclusivity and provide more opportunities for students.

This recommendations appears as if it will diminish A&M reputation in "STEM" rather than elevate it. The report states 12 of 19 peers institutions use this model but it does state how successful they are.

As a business staff member with the College of Geosciences. I personal do not appreciate the assessment for realigning our college with the Liberal Art college. I have had several students over the years I have been with my college state that part of the reason they chose us was because we did not have a large generic College of Liberal Arts and Sciences. Which they felt made it seem that the field of Earth Sciences were not the main focus and after speaking with these students, which have since graduates, I share that opinion. While yes combining the colleges will make them appear as one larger "college" I also feel this will take away from the special focus student come to except from Texas A&M. If these larger programs are a better idea why is it that all three Universities given in the examples for realignment are ranked below Texas A&M in the top research focused university? I feel the combining of the colleges would take away from our research focus and drop us in the country's ranking: Texas A&M (4th), University of Michigan (21st), Rutgers University (29th), and University of Florida (33rd).

Recommendation #3: Establish a Department of Journalism I am not against this recommendation, but why was the department of journalism discontinued?

Centralization for academic purposes would not be good for major-specific advising. When it comes to advising, students

need to be able to visit with advisors who have experience in the area and can offer more specific details and advice that a centralized unit cannot provide.

I wholeheartedly agree that the Bush School of Government and Public Service is a nearly untapped resource for the A&M brand. There is vastly more opportunity here in the way of undergraduate and certificate programs, internships and externships, and potential PhD programs.

The Mays College of Business must remain as a stand alone college. Putting it under Ag or grouping with another college will greatly limit opportunities for business grads, as it will seem like the focus is solely on Agriculture. Mays is one of the flagship colleges at the University, and one of the largest. As a former student - both bachelors and masters - I cannot stress enough how much I would disagree with combining Mays with any other college or program.

I have already commented once on the changes proposed for the Bush School, but had some additional thoughts, as I have heard people talking and thought about this more. I'd also like to mention that I am a TAMU PoliSci grad with an Econ minor and a current Bush School staff member, so I do view this from a slightly broader viewpoint. One concern I've heard has been that political scientists don't conduct research the way we do at the Bush School. However, within the Bush School, we have both political scientists and economists, who don't always see eye to eye, but for the most part respect each other and agree about the mission of the Bush School: Educate: Empower and equip future leaders to meet the challenges of a dynamic world Explore: Contribute to knowledge building, innovation, and problem solving through excellence in research and practice Engage: Enrich our communities, nations, and the world through a lifelong commitment to public service I have heard another concern that bringing in PoliSci and Econ would dilute the Bush School's mission. Perhaps they don't currently have the same focus on public service that we do, but wouldn't it be better if they did! Certainly public service is a core value of Texas A&M's and wouldn't it be better to strengthen that value within PoliSci and Econ? Another concern is that the Bush School benefits from being small, where people know each other, the students interact regularly with the professors. There is a wonderful intimate feel here that we wouldn't want to change. I don't know why that would have to change. If the Dean were over all three schools, and business services were consolidated and maybe a few other services, there wouldn't be a need to consolidate the faculty and students. And, yes, there might be more students taking a course here or there in the other departments, but for the most part the Bush School's master's programs, Polisci, and Econ could remain separate. It would be great to build a new building in the fan field for PoliSci and Econ. Those are my comments for now. Best of luck!

I don't understand it, but if it puts us more inline with other universities then it needs to be done.

It makes no sense to put the libraries under one of the colleges.

This is a very bold and forward looking plan, and will reimagine the way academic units can function. As staff in HLKN and Program Manager of the largest clinical research center (CTRAL), I very much look forward to this opportunity. I am unaware of all the details associated (e.g, degree programs, research support) with SPH, however, I do believe groups that are engaged in clinical research may make more sense to move to the College of Medicine. This plan may not be feasible for many of the other groups within the current HLKN department, but they too could be moved to alternative schools/colleges that are more suited to their areas of emphasis (e.g., sport management to business, health and other area of kinesiology to SPH)

The Liberal art and sciences should never go together. Their goals are completely antithetical to each other and they have VERY different success measures. This is a TERRIBLE idea. This will only continue the decline of science and further the infiltration of anti scientific thinking. Maybe this is the goal though, I wouldn't be surprised.

I am a Visualization student, and I fully agree with everything stated. Visualization needs to be its own college separate from Architecture, especially since most people don't even know the department of Visualization exists. I also agree that it would fit very well as the central anchor of this new college. It would definitely benefit the program to have people studying sound and music, theater and drama, etc. in the same program. There is a lot of potential for collaboration. However, as the visualization program is now, there are insufficient classes to learn the skills we are promised we will be able to do by the end of our four years. I am a senior now and can say I have definitely learned a lot, but I have also come to learn that the people who succeed and go to PIXAR are the ones who have almost completely taught themselves. There are few students who actually make it to studios like PIXAR due to a lack of a deeper education. As of now there is no course where you learn animation even though there is an animation track. We are just thrown in. I think adding courses that will adequately prepare the students is necessary. I am very excited and hopeful as I was pretty disappointed with the level of education within many (but not all) of my courses pertaining to animation, art,

coding for animation, etc. I think A&M is a perfect place to have an in-depth fine arts department as many people who want to pursue arts might not want to travel out of Texas and want the full college experience that A&M provides. I would love to be able to recommend this college to other students reaching out to me for advice on attending A&M for the arts because, as of now, I cannot, despite loving A&M otherwise. As for the realignment of the research within the department of Viz, I believe there should be an equal emphasis on research that is design based and centered around the creation of a creative artifact. I was a member of Aggie Creative Collective and loved this idea of writing an undergraduate thesis about our own creative work, similar to that of a fine arts thesis. The only issue I really have seen in the research being conducted in Visualization is that there isn't as much emphasis on creating a thesis that follows this model. This also makes it difficult to gather information properly and learn how to do research for a creative/design thesis effectively as most of our research in Viz already is focused on standard research thesis.

---

Report details extensive realignment plans, which has led to numerous concerns. Efficiency of different institutes being merged or realigned needs to be concerned. Where restructuring of entire institute is proposed especially across different cities, feasibility of such plans needs to be considered.

---

Biology Dept. has gained over 400 new students recently and has without hiring hardly any new faculty or staff, has pulled through and been a shining example of what other Depts. should be able to do when given very little resources. We pulled up our boot straps and dug in! Other Depts. within the report have had an increase of 20 students over the past couple yrs. not 400 students, so I would very carefully reconsider what Depts. if any get merged or consolidated. In my 27 years here I have seen this over and over again, new hierarchy comes in, tries to consolidate or rearrange things that they feel should "make things better" and in 4-8 years it's put back pretty much the way it was because it did not work out for the actual Depts. and the people who are hands-on having to deal with the work. The positions, the Depts. cut or rearrange will all need more help down the road bc some one "dropped the ball", something is not being addressed or attended to- "gee we have to make a new position there to cover that" - It seems like Reinventing the wheel at times. There are differences in how 10 year track positions are approved, how new faculty hires are carried out within Depts. for a reason. What works in one Dept.; funding, grant writing, teaching commitments, running a lab, training grad students, having grant \$ to cover them, technicians or a post doc, having TA positions to help cover Grad students stipends, function differently within the various Depts.. Also having big consolidated groups is not the best idea, if a consolidated group goes down, hits a hurdle, it is a major disaster to deal with, whereas smaller units can get back up and running more quickly.

---

Our library systems are some of the best in the country. Part of the reason we are so good is because the library staff are dedicated to helping the student experiences within the library. We don't need them to go teach courses in the Colleges of Arts and Science. That will take them away from giving quality time to the libraries and students using them. If you move University Studies to the College of Arts and Sciences, what happens to those University Studies degrees which better fit the other college such as Agriculture and Life Sciences and Mays Business School? Be mindful of the consequences of moving Technology Management to Engineering. Though the content aligns well, you cannot forget a large part of the Technology Management degree is to teach students to be the bridge/translator/liaison between information technology and employees who need IT help. Far too often IT related degrees do not teach the people side, the communication side. I fear that if you move Technology Management to Engineering you are going to lose the portion of the degree that teaching these students who to interact with people, how to translate IT speak to every day terms.

---

Page 24 talks about a "four-legged stool structure." How does that recognize the value of the other colleges (Mays Business School, College of Education and Human Development, etc.)? Page 25 suggests enhancing visual and performing arts focus. I appreciate the examples of other institutions in Texas. What I wonder (and have wondered over the years) is if we are trying to be all things to all people? If there are quality programs at other institutions, should we be building a similar structure, or should we be focusing our efforts and resources in areas where we already excel (or could easily excel)? Creating a new school/academy also seems like it will be it will also take more resources, so I am unsure of the efficiency of the decision. I am also confused because the organizational chart on page 24 includes an Academy of Visual and Performing Arts (under Academic and Strategic Collaborations) and recommendation #2 beginning on page 25 says establish a School of Visual and Performing Arts (in the College of Arts and Sciences). I am wondering what the overlap is if both of those entities are going to exist—purpose, resources, etc. Related to re-establishing a Department of Journalism (p. 27), did you review why the department was disbanded numerous years ago? Did you also look at the curriculum and the number of students who graduate from the TAMU Agricultural Communications and Journalism program? Similar to the Arts area, are we trying to be all things to all people if there are

other strong programs in the state? Rather than creating a new department (with the additional cost and resources) with multiple majors, should we be focusing on strengthening the current programs we have? It seems like creating a new department would be increasing inefficiency, rather than decreasing it.

Finding#1: The combining of multiple colleges has its advantages and disadvantages, although I don't believe it will have a significant positive impact on our core mission. Finding#5: I agree there are a handful of classes that have been duplicated across campus that could be streamlined with collaboration. However, the creation of a unique "Institute for Biological Sciences" will cause even more confusion for the students and implies a less predominant program when compared to other peer universities. This will negatively affect the recruiting for biologically focused students.

Many of these realignments sound sensible. A journalism department was closed some years back, so that one deserves careful consideration. The Libraries already provide information literacy instruction, but teaching faculty and advisors in other departments need to empower and encourage their students to take advantage. Leaving aside the matter of instructional programs in library or information science, moving library operations under a new College of Arts and Sciences would be a mistake in my view, as the Libraries serve all academic programs including engineering, business, agriculture, and medicine.

International Studies is a degree with 7 track and one is tied to political science, the other ones are not. This program is a Liberal Arts degree, which also includes MODL languages which the MGT people decided to leave out but it is part of the program. This is an interdisciplinary degree, which is not found anywhere of the "large" colleges and the majority of its course works comes from the college of Liberal Arts and requires a language that is also housed within our college. It is the same for Political Science and its required language for the bachelor of arts. All of these three programs have a master with the Bush School but it is a very specific tie with Bush school classes. Universities studies need to be housed in the colleges that are providing their main foundation and not just in one college. They were developed with an intention to serve specific colleges and then they can add a minor outside of the college.

Personally, I believe that combining the colleges of Science, Liberal Arts and Geosciences would not be in the best interest for our students. The College of Science is currently small enough to allow academic advisors and department faculty/staff to establish close relationships with its students and staff. If this were to happen, students would potentially lose the opportunity to form close relationships with their academic advisors creating a sense of isolation and confusion. They may potentially have to see a different advisor for each advising session due to potential centralization of advising. They would run the risk of receiving incorrect information through multiple channels. Currently the programs in the academic departments in the college of Science are highly ranked (specifically graduate programs), and merging with multiple colleges would put them at risk of losing their prestigious rankings.

I do not understand the rationale for removing the department of Biology from the College of Science, this would make our university an extreme outlier by not having the department of Biology in a College of Science.

N/A

How can the Library be impartial if they are incorporated into a college within the university? How do they provide equitable service and acquisitions when the budget is controlled by a specific college? Why is the band/orchestra not included in the proposed college of performing arts? What happens to colleges/areas not included in the four pillars? Do they remain or get broken down and spread out? How will reorganization and accreditation affect degree programs already in process? I don't think the biological science college goes with biomedical sciences in their practice, just in name. Nor Health & Kinesiology as part of school of public health. How will merging of colleges/areas affect new redundancy in positions? Students and staff like the smaller units and the unique learning, teaching, and working experience of that. What is the rationale of combining arts and sciences? Those have completely different basis in education/courses/plans, etc. How do we have control over the bush library? That is part of the national archives. Writing center is already in the library. I don't believe central advising would be beneficial to the student; you would be losing specialized, particular knowledge for degree plans by having advisors be generalized. Really like the idea of having a library science degree, but don't know enough about starting a new college to judge the recommendations for that.

I do agree that combining colleges to create a College of Science and Arts would help bolster the finances of all the departments within the college, and model after most top universities in the nation. However, I think the report unfortunately uses erroneous data to support its recommendation to create an Institute of Biological Sciences, when the Department of Biology should remain a separate entity within the new College of Science and Arts. The Department of Biology is squarely on an upward trajectory. Biology has increased the number of undergraduate students in the department by 500 (a 40% increase) over the last two years, through increased recruiting and increased diversity efforts.

This has successfully been accomplished despite no significant increase in the amount of faculty and staff. This feat has only been possible through strong interdepartmental relationships and highly trained and skilled faculty and staff with specialized knowledge. Additionally, contrary to the report's claims, the top 150 Universities in the nation all have standalone Biology Departments. Due to Cornell's different structure, the comparison to TAMU's Department of Biology is inaccurate. Finally, while TAMU houses many different life science departments and degrees in two different large colleges, those colleges have very different cultures, and very different goals, and subsequently attract students with different post-secondary-education goals. The COALS puts more of a focus upon the agricultural industry and veterinary programs, and attracts students that are interested in careers in those fields. On the other hand, the College of Science, and specifically the Department of Biology, attracts students that are interested in Pre-medical, dental, etc. programs, as well as graduate and PhD studies that are science-focused, as opposed to industry-focused. Thus, classes that seem redundant are actually structured with this in mind, and teach different material. It would be a disservice to students in both Colleges to try to combine them into an Institute of Biology. Unfortunately, the report has actually hurt the perception of the Department of Biology unnecessarily.

If this recommendation is accepted, I feel that it's important for each of these colleges to be allowed to sustain individual identities within the merged organization to be able to adequately serve students in these academic fields. The structure that I think would be most effective and efficient is to have a dean that provides oversight to the merged organization and Arts, Sciences, and Libraries being separate units within the organization. I also feel like additional review is needed pertaining to why these colleges and departments are structured as they are. For some, the current structures were recommended during applicable program reviews.

Regarding Finding # 6 Moving the Libraries under a College of Arts and Sciences seems problematic: The libraries are intended to serve the entire university; this makes it appear that they only exist for the College of Arts and Sciences. There may be conflicts of interest and inequities in budgeting and decision-making, as the college may shape collections and decisions according to their needs rather than the needs of all colleges and the university as a whole. Repositioning the Dean of the Library as an Associate Dean of Arts and Sciences and University Librarian does not seem consistent with the review that the report references. The report suggests that "heads of university libraries at peer institutions vary in position title." While true to the results listed, "forty-one of the universities currently have a Dean of the Libraries." That's 82% of the fifty land-grant universities in the review. A BA in Library Science does not seem like a lucrative or wise degree to establish. As the report itself indicates "most commonly, librarians earn a Master's in Library Sciences (MLS) or a Master's in Library and Information Sciences (MLIS)." Earning a BA in Library Science holds very limited benefit in the field; students would be much better positioned and more well-rounded if they obtain bachelor's degree in another discipline.

The need for veterinary graduates also increases the need for the use of animals. Public support for animal research is on a decline. A statement of support and transparency from Texas A&M would boost our community engagement. There is a lot of resistance to the idea that centralization is part of the President's plan. I do not agree. Centralization provides standardization and equity. It reduces redundancy. There is a sharp contrast between the care and use of animals within the CVM and those used by Animal Sciences department. Centralization here might help to enhance agricultural research and teaching and bring standardization up to levels concordant with current veterinary practice.

A College of Arts and Sciences only makes sense if the Biology Department is part of it. Every equivalent university in the country that has a College of Arts and Sciences includes a Biology Department. Creating the Institute of Biological Life Sciences doesn't make sense logistically. The proposed merger of Biology and BIMS would be incredibly inefficient from the viewpoint of undergraduate microbiology. The Biology department's microbiology program services pre-med and pre-nursing students and the BIMS microbiology services graduate students and pre-vet students. Biology belongs with the rest of the College of Science.

I am a Biology Staff member for 22+ years. I believe the Biology Department has been in an upward trajectory for some time now. With new Professors, and all the renovations going on in the Biology Department to support all this. The report it self sounded very negative about the Biology department. Which I felt that was wrong. I just wanted to tell someone how I felt. I believe the Biology Department and everyone in it should stay as one cohesive functional team.

I am concerned with the Department of Biology leaving the College of Arts and Sciences. While the department has had its fair share of concerns, with the new department head, recruitment of several new faculty, college-retention programs and a strategic plan in place, I feel they are moving in the right direction. All but one of the biology programs in the peer institutions listed have their biology programs in the Arts and Sciences college. The first two years of a

biology majors degree plan included classes only in the to be created College of Arts and Sciences (CHEM, MATH, STAT, PHYS and other core classes).

Being in the College of Liberal Arts - my concern is that by combining the 3 colleges, the dean of the new Arts and Sciences will be from either Arts or from Science. No offense but a dean with a MATH background (for example) is going to have a very different view of what English or Communications brings to the table. Journalism - either have it or don't but we are a laughingstock by flipping back and forth POLS into Bush School. I am not in POLS but all you need to do is spend 2 minutes with an POLS faculty and they will tell you this is a horrible idea. The faculty have a hard enough time teaching politics in a classroom (just ask them how contentions it gets in a Political classroom these days) without having a label associated with them. Like him or not associating the Bush name with a Political Science department automatically slants them to the right in the political spectrum I am also confused with the 4 pillars and then where do entities such as Mays Business School or the Bush School fall? They don't really seem to have a home in a pillar.

Some of the recommendations for academic realignment are clearly needed where very similar programs can be more closely aligned to achieve efficiency and synergy. However, the primary arguments for a combined College of Liberal Arts and Sciences are weak and superficial. These arguments seem to be that a) bigger is better and, b) TAMU needs to look more like other universities (which are not comparable). A bigger college does not provide a better experience for students, as I have observed while watching my own son struggle to navigate the College of Engineering at TAMU. On a related topic, centralizing academic advising would only make this worse as academic advisors with specialized knowledge of the college or department are often a student's closest ally in the struggle. One reason that TAMU doesn't feel like a very large university has to do with the many smaller academic communities in which students reside. The College of Geosciences is a great example of an academic unit in which students benefit from being known and supported due to its small size and hands-on involvement of faculty and staff. It is also a unique feature of the university not found in many others across the country and an anchor for world-class international research programs such as IODP. How does TAMU stand to benefit by hiding this unique asset in a larger college to look more like other universities? We have a unique origin story as a STEM-focused institution. We need to continue to leverage and build upon that reputation and strength. Instead of hiding the sciences in a larger college with liberal arts, we should seek efficiency and synergy that elevates the stature and quality of the sciences and highlights our unique scientific assets.

Recommendation #6 I do not feel that the recommendation given here is in the best interest of Texas A&M University. Beyond that, I feel that it poses an existential threat to the Libraries at Texas A&M, which is a foundational organization within the university that has been providing value to Aggies for generations. My rationale for this objection is based on the observation that The Libraries at Texas A&M have long dedicated themselves to the purpose of serving the informational needs of the university as a whole. The need for library services are not unique to any particular discipline and for this reason, it is essential that such services are rendered with an even hand to all disciplines. The autonomy of the Libraries is an essential part of its ability to offer these services in this way. From within the confines of any particular college, the libraries would lose their ability to orient themselves to best serve the needs of those colleges it was not a part of. It is essential that the Library maintains its independence so that it can continue to serve all aggies to its fullest abilities. I sincerely hope that this recommendation is disregarded as poorly considered.

What is the real reasoning in making us like other universities? Texas A&M University should be set apart from every other university because we hold ourselves to that standard and strive for greatness. There is nothing exciting about being like everyone else.

There was little understanding of the University Libraries expressed in the report nor was there indication that MGT had invested resources to investigate the University Libraries before creating this report. Creating a Department of Library Sciences would create a program to teach students how to become librarians rather than teaching students the necessary skills to do research or find and use resources needed to succeed within the students' specific fields of study. Faculty Librarians are subject experts embedded within the University Libraries to teach students to do research and assist them in locating and understanding what avenues of program specific information are available to students with coursework in all schools/colleges at Texas A&M University. This is accomplished through library consultations and through classes taught to groups of students within the various schools and colleges. Core curriculum courses dedicated to information sciences will not elevate the faculty librarians as teachers because such courses are focused on teaching students to become librarians rather than leveraging the wisdom and expertise of faculty librarians as information subject experts in a variety of fields (i.e., marketing, patents and trademarks, entrepreneurship). To properly fulfill the mission of the University Libraries, it is necessary for the University Libraries to remain independent of any sort of direct reporting to a particular school or college within the Texas A&M University System. By following the recommendation to

merge the University Libraries into a newly created College of Arts and Sciences, the message is communicated that the University Libraries primarily serve the College of Arts and Sciences rather than providing resources and services to all students at all schools and colleges within the Texas A&M University System. A merge as suggested would undermine the effectiveness of the University Libraries in assisting the full spectrum of students to excel in their educational careers, communicate favoritism and elitism which would discourage students in colleges other than the College of Arts and Sciences from using library resources, and inform Texas A&M University stakeholders that there is no longer interest in providing University Libraries services and resources to all students and patrons who have need of everything the University Libraries provide. Therefore, the University Libraries best serves the student population and all Texas A&M University System stakeholders by remaining an independent entity, with its own dedicated HR, Facilities, and Information Technologies/Digital Initiatives departments, within the Texas A&M University System. Additionally, Writing Center locations, Open Access Labs, and partnerships between academic departments and the University Libraries are already in place to provide student learning opportunities that bolster the curriculum required for degree programs offered. The recommendation of implementing University Learning Commons models as stated within the report is indicative of a lack of research conducted by MGT Consulting in preparing the report since these library spaces already exist.

---

Never enough time is spent on student retention. Students need more assistance in the cost.

---

The report does not make it clear what happens with other Colleges that are not listed in the "four stool plan", college of education. Mays, Bush School, and others. The consolidation of the College of Liberal Arts and the College of Science seems to be a move against the foundation of higher education. How are these two colleges supposed to provide quality support to the number of students that are currently in both of these colleges? The housing of the University Libraries under the College of Liberal Arts would cut off the libraries from the rest of the university. A function that serves not just one college but all colleges and students as well as the outside community.

---

Let's get really clear on what it means to be a land-sea-space- grant institution and let's keep our focus on that. We are founded as an engineering and agricultural school. As a former fine-arts person myself, I really appreciate the recommendation for #2 but I do not think this is in our scope so no, we should not invest our time and resources into this effort. I started my career at TAMU in the department of Journalism and I was the last person on the payroll in that department as it was shut down by the dean. In the 20 years that have elapsed since this happened, nothing has happened that would lead anyone to think that a Journalism department is now needed. Again, let's get really clear on what it means to be a land-sea-space- grant institution and let's keep our focus on that. We are founded as an engineering and agricultural school. As a former fine-arts person myself, I really appreciate the recommendation for #3 but I do not think this is in our scope so no, we should not invest our time and resources into this effort. I support and agree with recommendation #4, #5, #6. Recommendation #7 doesn't seem to be moving in a direction that integrates TAMU Health more fully into TAMU, it looks like they're still needing to be linked but are still somehow a bit apart from main campus. I think this needs to be thoughtfully executed and just because we get our funding from the state in different manners doesn't mean that we need to treat them as a separate entity. After several years of this we are sick of it. Get with the rest of TAMU and let's stop talking about them being any different than a college. I support and agree with recommendation #8, #9a, #9b, #9c, #9d.

---

The report states that TAMU should be 4 academic pillars, but there were several colleges/departments not mentioned in the report or listed as part of these 4 pillars. What would happen to these colleges and/or departments?

---

Love the idea of a journalism department, as long as the lessons learned historically are kept in mind. There was a reason the department was dissolved, and I just want to make sure that we don't fall into the same pitfalls.

---

I don't think that centralizing advising is a good idea as there are too many little details in each degree. students would not get as knowledgeable advice and could lead to issues with graduation and accreditation

---

What is the benefit of combining liberal arts and sciences besides funding for liberal arts? why are the cons to this plan not addressed? How does this impact the current structures of these colleges? how does this impact the staff and potentially duplicated positions by merging so many colleges?

---

Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. --I worry that merging these colleges into one will minimize (and perhaps also marginalize) the humanities. I don't agree that the "larger college structure creates a stronger advocacy for the liberal arts education at a STEM-focused university." I think it may actually minimize funding for humanities and that the money and resources will go towards strengthening the sciences at TAMU at the expense of decreased funding and resources

---

for the humanities and liberal arts. Recommendation #3: Establish a Department of Journalism.--I don't see anything in the report about the history of journalism at Texas A&M. I remember when journalism was eliminated as a major at TAMU. The report doesn't consider this, and I think that, without the historical context of journalism at TAMU, this isn't a recommendation that is supported by evidence. Also, I'm not sure that the authors of the report understand journalism as a major. For example, I think many classes in various departments throughout Liberal Arts are focused on increasing "media literacy and capabilities of students" and "further[ing] local community engagement."

Recommendation #6: Merge the University Libraries into the newly created College of Arts and Sciences and create a new Department of Library Sciences.--I don't think the authors of the report really understand what academic librarians do. Academic librarians don't need to be moved into a new college and department to make a difference in undergraduate and graduate education. I think doing this will overburden librarians on campus even further.

The compression of Liberal Arts, Sciences, and Geosciences will almost certainly mean a loss of funding for humanities departments. Please do not do this.

I appreciate the consultants' efforts and their report. However, regarding the proposal to remove Construction Science and Visualization from the College of Architecture into other colleges, the consultants appear to be operating from a faulty premise — that the college has strayed from a "core mission" of design and planning and should "refocus" on this mission. The college's core mission is teaching, research and service regarding the natural, built, and virtual environment, and doesn't need a "refocus" because it hasn't strayed from this mission. There are already plenty of interdisciplinary opportunities available for students within and outside the college as it exists today. Architecture, landscape architecture and urban planning don't exist in a vacuum. Interdisciplinary opportunities that exist now will be reduced — precisely what students in these degree programs don't need. The consultants believe visualization will have a better chance to grow outside the college — this ignores the department's growth that's already occurring in the college, with the addition of an MFA, and new emphasis on game development other areas. By residing in the same college, construction science and architecture students are exposed to two different, yet related elements of the built environment — design and construction management. While they are different disciplines, students' proximity helps widen the perspective of both groups.

Finding #1 - Not particularly on board with combining Liberal Arts and Sciences into one college, especially considering the size of these departments and if a school of visual and performing arts were to be added. Finding #2 - I am for a school of visual and performing arts being added to the campus, as it seems to be one of the few things TAMU does not have and I feel we would have amazing Aggie talent come from here. Relocating the Viz department to this new school would be a good idea as well. Finding #3 - I completely disagree with adding a department of journalism. This is the a degree in Communications, which is already a degree offered and I know many who graduated in that program as well as from the English program that have gone on to be in journalism and other media professions. This seems like a completely unnecessary addition to a program that already exists at TAMU. Finding #5 - This report seems to contradict itself. It urges centralization, but wants to add many, many new departments, offices, and colleges. (A new Institute of Biological Life Sciences....?) Finding #6 - Libraries should remain as is. Finding #9d - Okay with consolidating Dept. of Health and Kine. into the School of Public Health and with moving Technology Management to Engineering.

Combining Liberal Arts, College of Science is excellent proposal. Establishing a School of Visual & Performing Arts, Relocating Viz Dept, a Dept of Journalism are cornerstone elements. KAMU, with its PBS Brand, and 12th Man Productions in Athletics, with its ESPN affiliation, must be included in a wholistic part of a Visual & Performing Arts School. Broadcast Journalism and Social Media are all intertwined in Television, Creative Media and Storytelling. Texas A&M MUST put KAMU into a central role as a KEY COMMUNICATIONS HUB for this storytelling. From an Academic standpoint, there is an opportunity here to be a TRUE LEADER in a discipline that touches all phases of a STEM-based education. Students at 12th Man Productions already learn Broadcast technical Live Event and Post Production skills and get NO Academic credit for it but are gaining employment in national industry positions in networks currently with just as big an impact as the Viz Students but no one knows its happening. Tie it to a curriculum. KAMU, if it were a COMMUNICATIONS HUB for the Performing Arts with Fiber connectivity to EVENT VENUES could be BOTH a studio space, a Control room technical learning and operational space for events and a LIVE EVENT creative platform for storytelling for the University at LARGE with both the PBS side and the National Media opportunities from a Marketing side. This helps with the CENTRALIZED Marketing & Communications needs as well. A larger more robust staff that can be forward thinking, creatively engaged with Research, University News and Student stories that help in recruitment, retention and brand-building (AND utilize the student Journalism classes and lab opportunities as well to give real-world opportunities) helps grow the Texas A&M Brand and creates a more effective education model and communications

model. The Arizona State model, University of Texas Model, Florida, Michigan State, Notre Dame, BYU have effective ways to study as to how to do this right. Bringing back Journalism and combining with Communication makes sense as to having a curriculum with hands-on experience will prepare students for the real world. The ability to have an experienced faculty in the disciplines needed will create a strong foundation for several career paths and helps with strong decision-making and creative thinking for leadership development.

---

In reference to recommendations #1 and #2: As a staff member in the Dance Program, in the Department of Health and Kinesiology, the idea of creating a College of the Arts and Sciences is very exciting to me. I think that our program specifically being a combination of the arts and sciences, would thrive in that environment. We already collaborate with both the Visualization and Performance Studies departments, so this would aid in those collaborations. The main concern I have is that if we do move, we get lost in the process. We would like to be in the School of Visual and Performing Arts if it is done in a manner that supports all of the arts. We do not want to end up being in a department that won't provide any support to dance. It would be best to function in this school with each of the arts in their own departments (i.e. Department of Performance Studies, Department of Dance, Department of Visualization). We also need to keep the integrity of our Dance Science Degree. We are one of the leading Dance Science undergraduate programs in the nation and are well known throughout the International Dance Science community. We are also the only Dance Science degree in the state of Texas, so we serve a specific niche of students who want to go on to be medical professionals serving dancers. Many of our students come into our program with this goal, and it is what brings them to us. As a recruiter, it is something that helps us stand out against the other dance programs in the state and country. Being in an art college would provide us with the opportunity to then develop an additional Dance degree focusing on education and performance. It could also lead to possibilities of collaborating with the other arts departments to create minors such as Dance and Technology. In order for this to happen successfully, a Performing Arts Center with the school is vital. This would provide the opportunity for faculty, staff, and students to collaborate on a more regular basis, and provide them with some of the best educational experiences they could have. If the School of Visual and Performing Arts opportunity does not present itself, it is best for us to remain within the Department of Kinesiology. Our students already take courses within the department, and the mission of our program aligns with kinesiology.

---

I think combining liberal arts with geosciences and science is a good idea, as long as it's executed properly. The liberal arts college could definitely use the resources that being in a larger college would provide. My biggest concern is staff redundancies in the merging process. If you want this to go smoothly, being up front about all of the steps involved will be key. People are scared about job security right now, and communication from upper levels about that will help ease people's nerves. The sooner the better.

---

Recommendations 1, 3, 5, 6, 7, 8, 9a, 9b, 9d: Combine three colleges to one. I fully support these recommendations, though it will require significant leadership at every level. Recommendation 2, Establish a School of Visual and Performing Arts.... I disagree with this recommendation. I was a member of both the Aggie Band and the university's wind ensemble as an engineering student and am a past and current donor into the fine arts and music programs. I believe creating/standing up this new School would siphon critical resources (significant investment(s) required is called out repeatedly surrounding this effort) at a time where the state economy is down, enrollment is already booming, and the current program offers many, many opportunities for students to participate in the fine arts program...and they do. I agree a School would result in more performances available for students and the public to attend, but my experience with family members who majored in music is that most of the event attendees, such as recitals, were friends from the music program and family. I don't recall a student activity where all the seats at a venue were filled...other than a sold-out football game. Secondly, the report does not identify a need in the state for more fine arts majors due to the inability to staff orchestras, art galleries or K-12 teaching positions. If/when the economy turns around the many investments become easier and I would be more open to this opportunity, but not now. Recommendation 2, "...relocate the Department of Visualization to anchor the school. Since I do not support the basic recommendation, I do not support removing Visualization from the College of Architecture (CoA). CoA created, nurtured and grew it to become "one of the most recognized and highly valued degree programs at TAMU." The argument in the report is that the Department's growth is limited by the College of Architecture. Yet it turns around and says to be successful in the new School will require significant investment. If we want to grow the program and stature further, we can just as easily make the investment while the Department remains where it has bloomed so successfully to become an industry leader. I support increasing our investment in the program and growing it. Recommendation 4. Elevate and expand the Bush School...". I agree with the recommendation if it can be accomplished in a manner that does not diminish the Bush

School “brand” and public service focus of students studying under this “umbrella” name. Political Science is not always about service... Recommendation 9c. “...relocate the Department of Construction Science to the College of Engineering...”. I strongly disagree with this recommendation because of its impact on both the General Contractor industry and Architecture firms—our students would become less prepared to productively enter the work force. My opposition stems from being both a property owner/owner’s representative AND engineer working construction projects over a 30-year career with countless general contractors and architects. Rationale: a. A&M has built an integrated academic and project curriculum that ensures our graduates are ready to enter a work force where The key business relationships are between a property owner, the architect and the general contractor (GC). GCs work principally with architects, who in turn work with their engineers and subs when changes are required. This relationship is intentionally developed through their years as a student at A&M. b. Construction Science focuses on construction and modification of buildings, not engineering manufacturing. It has grown into the nation’s largest construction science program, with 100% graduate placement due to this focus and the associated heavy industry support financially, with internships and job fairs. 66% of graduates are hired into GC firms with the oil industry a second high placement industry. c. Moving to engineering would produce a different type of student and graduate, one more like other schools whose construction science/project management type programs reside in Colleges of Engineering. Students in engineering are required to take engineering calculus courses and complete ABET accredited programs focused more on engineering project management (which includes construction) than construction. Additionally, the College of Engineering requires all first-year students in the College to complete the same coursework before applying for a specific major. The Current Construction Science Program is accredited by the American Council for Construction Education requires “Math for Business and Social Sciences” rather than calculus. Calculus alone will shrink the pool of eligible applicants, the diversity of applicants, and the pre-eminence of the “I just want to build” mindset currently common in the department. This is why Construction Science is #1...we don’t need to strive to be like those who rank lower! d. The report states that “significant connections between this department and” departments in the College of Engineering exist, including research connection at RELLIS and with the CIR. While these connections are mutually beneficial today, the assessment fails to describe how they would be improved or what gaps exist in current partnerships. Nor does the report describe the need to maintain relationships with the CoA if moved. e. If there is a desire to create a project management type degree in the College of Engineering it can be done and can be distinct from Construction Science, with a greater focus on manufacturing and other engineering project management and requiring calculus and ABET accreditation. Recommendation 9c, “...relocate the Department of Visualization to anchor the school. This is the same opposing comment I made earlier. Since I do not support the basic recommendation, I do not support removing Visualization from the College of Architecture (CoA). CoA created, nurtured and grew it to become “one of the most recognized and highly valued degree programs at TAMU.” The argument in the report is that the Department’s growth is limited by the College of Architecture. Yet it turns around and says to be successful in the new School will require significant investment. If we want to grow the program and stature further, we can just as easily make the investment while the Department remains where it has bloomed so successfully to become an industry leader. I support increasing our investment in the program and growing it.

Combining colleges only manages to make the students feel smaller and more invisible within the University. As a former student, I thought it was a plus that there were multiple colleges that were smaller and more targeted. These smaller colleges made it possible to feel involved and have the ability to go talk with the Dean of the college. If these were larger, the Dean of your college would feel untouchable and out of reach. I know from personnel experience with the former Dean of the College of Engineering that she was and is untouchable and never had time for meeting with students. All she did was bounce from one meeting to the next meeting to the next event. From those that I know from the College of Engineering the size of the college makes you feel unknown. As I recall, there was a Journalism department...that failed. 9C. I wholeheartedly disagree with the rational to remove the Construction Science from the College of Architect and into the College of Engineering. As someone who works in the Construction industry, the level of involvement with Architects on a construction project is much higher than it is with engineers. Not only do construction managers need to know how to work with an architect, architects also need to know how things are actually built. The biggest problem I see in the architecture world is the inability for an architect to step outside of the final beauty and art of their design and actually make something that is constructable. The construction science department needs the architecture department and the architecture department needs the construction department. Both of these industries need to know how the other works to provide a successful project. While I cannot argue that engineering knowledge is need for those managing construction project, the Department has addressed this with

required structure courses. One role a construction manager should never play is engineer. They need to know the basic understanding of principals of engineering, but they do not need enough to be dangerous either. Engineers have a professional license for reason and that sort of liability should rest with the engineer. While they do all have to work together, the architect is typically the main point of contact for the contractor not the engineers. The engineers work FOR the architect and the contractors work WITH the architect to build the building. The college of engineering is already too large, and adding an additional department would only make the Construction Science Department more invisible. The reason the College of Architecture is where it is, is not because the COSC department is within the college. The College of Architecture needs to look into providing a 5 year degree option where you can get your bachelors and masters. Other universities have this option.

---

My feedback on the proposed academic realignment is specifically related to how this potentially impacts the International Ocean Discovery Program (IODP), the \$351M award to TAMU from the National Science Foundation (NSF) to operate and manage the research vessel, JOIDES Resolution. TAMU has successfully competed for the role of JOIDES Resolution science operator three times (1985-2003, 2003-2014, 2014-2024). Part of that successful approach has been TAMU's deep and long-lasting dedication to the Geosciences, which has been a critical area of study historically in Texas as well as for the vital future challenges facing the State. It is worth noting that other major flagship university in Texas elevated Geosciences to a college-level unit in 2005. I am concerned about the proposed merger and the unintended message this sends to the IODP science community and the NSF Directorate for Geosciences about the importance of Geosciences at TAMU. The timing is critical as we to work to extend the award operating the Resolution in the near term and position TAMU to compete for longer term involvement in the process to build and operate a new vessel.

---

I laud the effort to strengthen the Liberal Arts, but this report doesn't bear witness to the fact that Liberal Arts is already the second largest college on campus. This report also doesn't seem to have a sense of the history that led to the split of Arts & Sciences at TAMU in 1965. It is also unclear why, if you are suggesting the creation of a new Performing Arts center and majors, why these would not be housed in a college of Arts & Sciences? The suggested realignment is unclear. The Executive Summary only notes four colleges (Agrilife, Engineering, Arts & Sciences, and Health) , but in this section it is clear that Architecture, Business, and Education would still exist. A chart, similar to those provided under the foregoing sections would bring much-needed clarity. The University Studies degree is not a Liberal Arts degree. It is certainly interdisciplinary, but you would probably generate discontent if you were to suggest that interdisciplinarity is the sole province of the Liberal Arts. This recommendation, like others about specific major changes in this section, feels woefully underdeveloped and poorly supported. For example, there is not any mention of the rich history of the Journalism major at TAMU.

---

The consultant's report indicated that a decentralized operational structure resulted in inefficient use of resources. I believe that such a structure also places those on the front lines of implementing the work of the organization closer to the top of their organizational unit. That proximity normally offers a better foundation or basis for policy decisions than a more hierarchical and distant management team. In the same sense, a democracy is less efficient than a centralized authoritarian system. If the university's organizational structure is to be "streamlined" or "tightened-up," measures should be put in place to facilitate communication and a sense of shared responsibility between the tops of operational units and the levels of the "worker bees."

---

See <https://www.aggienetwork.com/theassociation/chronology.aspx> 1965 College of Liberal Arts, College of Science and College of Geosciences established. College of Arts and Sciences abolished. Recommendation #1 was tried, in 1924. After forty-one years, the University chose a different path. It is noteworthy that the University of Texas was not mentioned in the report as a peer institution. It also had a College of Arts and Sciences for eighty-seven years which it split in 1970. <https://liberalarts.utexas.edu/office-of-the-dean/history.php> While there may be examples we can take from peer institutions, our students chose to attend Texas A&M University. Had they wanted an educational experience more like those offered by one of our peer institutions, it is safe to assume they would have enrolled elsewhere. The report's repeated references to other schools invokes the childhood question of "if all your friends jumped off a bridge, would you jump too?" If we were to do exactly what other schools are doing, we'd be just another piece of gravel in the driveway. We are better than that. We are seen as a leader because we do what we do in such a way as to produce exceptional graduates who become leaders themselves.

---

As a former student, the four major college model appears to diminish the value of the colleges put together under what feels like a much too broad umbrella of "Arts and Sciences". I understand that just over half of peers reviewed have a similar arrangement; however, I do not understand why the University of Texas, our primary competitor for top students, was not included in the evaluation. If any of these colleges appear more "elevated" by attending UT, that

would be a concern.

---

The Technology Management degree does not belong in the College of Engineering. It is better suited for College of Education and Human Development because besides focusing on the Technology side, it also incorporates coursework from the Human Resource Development program, equipping the students to have both Technology skills and people/management skills. Plus, it serves as an option for students who are unable to successfully complete the courses required for General Engineering - Tech Mgmt can use MATH 140 and 142 instead of MATH 151/152 and has more freedom for choice of Life and Physical Science - so students who cannot pass CHEM, PHYS, or Engineering MATH can find a place where they can be successful. Keep that program in the College of Education - but build it to be a destination program, not only a landing place for failed engineering students.

---

Somewhat neutral on the recommendation to combine arts and sciences. While the report points to peer analysis, TAMU is a unique TEXAS Institution with rich history and tradition, which is evident in student recruitment and enrollment numbers. Being like "the rest" is a risk and potentially waters down what current and former students were attracted to when choosing to come to TAMU. However, clear lines to efficiency and academic redundancies have been identified. I think there are pros and cons to both sides of the position - but not sure either is significantly weighted over the other. With respect to the Bush School, I fully agree that elevating and expanding is a good move to achieve higher visibility. I agree that significant investments should be made in the Bush School to enhance and advance the mission of educating and preparing more students for public service in the local, state, national, and international landscapes.

---

Interesting findings; these do not directly impact me so I do not have any feedback to offer.

---

I don't have any feedback for this section.

---

I think combining arts and sciences will not give the arts the money it needs like this report says it will. Even though art majors are consistently popular, it will not change the fact that the university does not value the arts as much as STEM majors.

---

I have concerns over the implications of merging the Colleges of Geosciences, Science, and Liberal Arts. As a staff member at IODP within the College of Geosciences, I view the College of Geosciences as being unique in its ability to support IODP. IODP has highly specialized needs that would not be compatible with centralization within the university (e.g. needing our own travel and HR departments that can efficiently and rapidly handle situations). Further, my impression is that NSF views it favorably that IODP is housed within a College of Geosciences, where College leadership understand IODP's mission and advocate for the program. With the renewal of IODP coming up, and building of a new drilling vessel, this leadership and advocacy will be important. Secondly, as someone who teaches and mentors students within the College of Geosciences, I have concerns about the impact of the merger on students and faculty. While merging could increase interdisciplinary courses and collaborations, my understanding is that having a separate College of Geosciences is an excellent recruitment tool for students, where they know they will receive quality, individualized educations, and an important component of placing students in jobs post-graduation, as the caliber of graduates of A&M's College of Geosciences is known within the industry. I am curious to know what the evidence is behind the MGT report's statement that the combined colleges will "heighten its stature," as it seems the individual colleges will actually lose an aspect that makes them unique and appealing to students. The primary motivation for the merger appears to be cost-savings achieved by centralizing administration, which, in my opinion, could do a disservice to students, faculty, and the centers for excellence within all of the colleges by decreasing the efficiency and individual relationships built within slightly smaller units.

---

While I'm not a biologist, I find it strange that biology would move out of Arts and Sciences even while they would still take the large majority of their courses in the College of Arts and Sciences. Biological Life Sciences also seems redundant; maybe just Biological Sciences should this institute happen. While I agree in having students already taking similar courses together, I am interested in knowing more about the disciplines of the BIMS and BIOL degrees and how they are different enough to warrant separate departments. If they both need biology degrees and differ only at the graduate level, then only appropriate undergraduate programs should persist. Regardless, these seem to fit with Arts and Sciences, as biology is a science. Do our peer institutions also separate biology and place it in another college? Again, incredibly disappointed in the sources to support these recommendations (e.g. Rutgers is not a peer institution).

---

Report recommendations of additions of departments and centers would strengthen the University as well as help with recruitment.

Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning No. Over the years donors and administrators have invested a lot of time, energy and money to enhance the interdisciplinary synergies realized by having the current disciplines in the same college (architecture, landscape architecture, urban planning, construction science, and visualization). If, as the college leadership requested – the name be changed to College of the Built Environments – it would probably have been clearer to MGT how these academic disciplines work together and strengthen our student's learning and experience outcomes. Establish a School of Visual and Performing Arts with new departments in music, performing arts and fine arts, and relocate the Department of Visualization to anchor this new school Two options make sense to me – either creating a new college with music and performing arts (if it can be determined that prospective student enrollment would support this): -Create a College of Architecture, Visual and Performing Arts, making the College of Architecture (with all of its current components) the cornerstone of the new unit. What MGT didn't discover in their review is that architecture, construction science, visualization, landscape architecture and urban planning are integrally intertwined in industry – and in the best interest of students should remain in the same college. Architects and construction manager work together throughout most of a building project's life. Engineers come and go to the project based on their area of expertise. All of the current disciplines housed in the College of Architecture have strong connections to visualization with designing in both real and virtual worlds. -Create a College of Music and Performing Arts using Reed Arena and the Rudder theaters as performance facilities until/if strong community support can show a sustainable demand. Establish a Department of Journalism Yes! It never should have been abolished, instead it should have been strengthened. Move political science to the Bush School of Government and Public Service That makes sense Move all University Studies Students to the College of Arts and Sciences Not a good idea. The few college's that have university studies offer focused creativity in developing independent studies degrees that help students go where they want to in the future. In the case of the College of Architecture, university studies students combine courses across the interrelated disciplines to blaze a path to a number of unexpected careers (i.e. package designer, stage designer, video editor, marketing professional). University studies students in the College of Architecture have higher GPAs and are more self-motivated than most of the traditional majors. They are not, like MGT suggested "unqualified." Consolidate the Department of Health and Kinesiology in the School of Public Health and Move Technology Management Degree Program to the Department of Engineering Technology Not a good idea. Public health has a community focus while health and kinesiology have an individual focus. To serve students best, having a clear delineation of these disciplines and having them in a college with teaching (since many who major in health or kinesiology become teachers) makes the most sense. If technology management as offered is a highly sought-after knowledge/experience set that makes our graduates highly employable. It is a combination of technical, business and educational skills that attract a different type of student that engineering technology does. Combining College of Liberal Arts, the College of Science and the College of Geosciences to create a new College of Arts and Sciences After further evaluation of the possible unintended consequences of combining these colleges, this recommendation might make sense – if it doesn't negatively impact students. Elevate the Higher Education Center at McAllen If McAllen and our other teaching centers are sustainable as system campuses, it would be worth the investment to expand and strengthen them. If they better serve students as teaching centers, moving all branch locations (i.e. Round Rock and possibly McAllen, etc.) under one assistant or associate provost makes sense to me.

I think centralizing advising will do a tremendous disservice to our students. A centralized process will take away from departments' ability to be flexible and respond to student needs. I do not agree with the idea that a centralized system will be able to better serve students than a department level system. Just as people in Texas better understand the needs of Texans than people in Washington do, departments better understand the needs of their students than a university level system would. Moving to a university level system would only serve to empower those who control it. I understand why that matters to some in the university, but the idea that it is being done to save money or benefit students is misguided at best.

Re: the college aggregation of Geosciences, science and liberal arts, I believe if this provides some parity across peer institutions, this is a smart step. I am sad however, to see two feathers being plucked from the College of Architecture's proverbial hat (VIZA and COSC). As an undergraduate of the COA (ENDS '02), and a M.S. graduate from the famed "Viz Lab" program ('08)... That being sad - change can be good and I think moving Viz to a more sensical ARTS program is a good thing that will enable the unit to better recruit students and donors that are excited at the prospect of building a new legacy on campus.

I agree with this realignment, especially the integration of music/arts as a focus.

I think we should leave Texas A&M University as it is. We are ranked one of the top institutions in the Nation. Students come here from all over the world, because of our Colleges. A great example is our Department of Visualization in the College of Architecture. Our students are getting high paying jobs with DreamWorks and Pixar before they graduate. The Students know that The Department of Visualization is a very competitive program and want to come here. This department is what makes the College of Architecture a strong college, along with the Department of Construction Science. The Libraries should stay as it is. There are many components to the Libraries that probably would not exist, if moved into a Department. A good way to test or research this, is to look at other Universities that have this model. Are they as competitive as Texas A&M University? Are they comparable like The University of Texas?

Recommendation #5 would be a mistake. The department of Biology does not belong in the Ag School, it belongs solidly in the College of Arts and Sciences along with Chemistry, Physics, Math and Statistics- sciences based on hypothesis driven basic research and not on Ag applications. Biology as a department functions as an efficient teaching and research unit. While adding the Biology Dept. to the Ag school would definitely upgrade the ratings on the Ag school, it would seriously detract from the upward trajectory of the Biology Department whose strategic plan has been a driving force for real advances in teaching methods, research initiatives and facilities improvements. There is no data in this report to support the idea that moving Biology to the Ag school would benefit the University as a whole, and may drive a large loss of retention and donor dollars. A more rational move would be to bring Biochemistry and Biophysics into the College of Arts and Sciences and out of the Ag school.

This is only stated to extend to administrative reorganization and oversight over programmatic decisions. Is bigger, better?

Wow. Again, the realignment they suggest would entail college deans be willing to give up power and money. Anything is possible but it would be a huge paradigm shift.

I feel that combining Liberal Arts, Science, and Geosciences to create the College of Arts and Sciences is not a good idea. Rather than boosting liberal arts, it will water down the sciences. If you want to combine the colleges of Science and Geoscience, that is understandable, but don't put liberal arts into that mix. The LA can be supported on its own-it doesn't need to be part of the science to increase its funding or expand its offerings. However, our goal should not be to expand programs that do not provide return on investments for students--they need to get jobs after graduation.

My comments pertain to the mission of the College of Geosciences. I work for the International Ocean Discovery Program (IODP). IODP was not mentioned explicitly in the report but is a large research organization that belongs to the College. IODP has been housed at TAMU since 1983, has >100 staff, and is responsible for implementing complex, seagoing research expeditions with the JOIDES Resolution drillship on behalf of NSF. IODP is in fact the largest NSF grant TAMU gets and has elevated the University's position among large research institutions. IODP research scientists teach and mentor students in the College of Geosciences. The US and the world are currently in a critical period where we are fighting for the health of the planet and for trying to figure out how to utilize conventional and renewable resources to produce energy. The current small size of the College makes it an attractive destination for students and also makes it easier for the College to be flexible and innovative. This advantage would be lost if it is merged in a large college triple or quadruple its size. IODP also presents some special operational challenges, which I will address in the HR and IT sections below.

More transparency is needed in regards to the status of the schools/colleges (e.g. Mays, Bush School, College of Education and Human Development, Architecture) that do not fall within the four large academic unit models. Will those schools/colleges operate independently?

The Biology Department is well-regarded among the students and is growing. They teach excellent classes and have a great seminar series. Their graduate students are HAPPY in their program. The devastating impact of moving the program on the current students will have an extremely negative impact on the Texas A&M retention and graduation rate statistics. Additionally, the proposal to move a major into a department that already has a different major with separate classes that is being relocated to a new Institute sounds like more confusion than it promises to alleviate. Among the students on campus, it is very clear to them which major they wish to be part of based on their future plans and how hard they want to work while on campus. It is well known among veteran staff and advanced students that BIMS is a less-rigorous major, Biology and Genetics are a solid programs of study, and Biochemistry is rigorous and difficult. Most students move down from the most rigorous major to the medium or lighter majors that allow them to complete the prerequisites for professional and medical school. Removing these options will likely impact on the

number of former students that acquire advanced degrees and can donate back to the university. The name proposed as "Institute for Biological Life Sciences" sounds incredibly uneducated to a Biologist as it is redundant and doesn't particularly distinguish itself from other units on campus also studying the Life Sciences. A Department of Library Sciences seems to me the place that would train librarians, not the people doing research in new and innovative ways since that is what every graduate program in every department already does in a manner tailored to their discipline.

Based on the lack of information in the report regarding the Mays Business School - I had difficulty visualizing how the new formed four large units listed (as listed: AgriLife, Engineering, Arts and Sciences, and Texas A&M Health) encompassed or included the business school and its impact. As a parent whose two children were very successful at Mays and in their subsequent careers, I would have expected the report to make that list FIVE units that create the academic foundation with Mays an equal to any of those four listed. Otherwise the rationale for the proposed changes makes sense.

Agreed that some academic realignment is needed. In your report I do not see that the Mays School of Business was mentioned. They are a large part of this university. In the condition of our global condition it would be logical to invest more in our geoscientist. They are working on research that will can help save our planet. The students we are developing also have the desire to improve our planet. Each day there seems to be a new disaster such as flooding, historic rain fall, massive fires and the list goes on. The university should be investing more money in this area that will potentially have a major impact on our earth. Less focus on a school of dance and music is needed. There are smaller liberal arts instituions that students with those interest can attend. Our university is not just a land grant instituion but we have the distinct honor of being a land, sea and space grant institution. The College of Geosciences is heavily involved in all of those areas. Many of our degree plans are STEM degrees and should not be lumped into a liberal arts college. We are privileged to have a College of Geosciences because few colleges do. The college itself brings much pride to our students. The feedback I have received from students is that they would be devastated and embarrassed to be housed in a liberal arts college. Stature is not rated by being the largest which is one of your points for combining LA, SC and GE. Stature is earned by producing sound and solid students in their fields. You reference that this realignment would redefine the new college as one of the 4 legs in the stool. Again I mention that the Mays school of business was not even mentioned. Which leg would they be on this stool? Lastly, no one mentioned or reviewed the Graduate Professional School (GPS). They are one of the most disfunctional colleges on this campus. It is in total array. Such a high turnover of employees it typically a sign of managment or lack of.

I do not agree with combining liberal arts with sciences. These seem to me to be two very divergent areas of study. This takes away from the familiarity and more intimate groups within each area. It feels like this is more about saving money for administrative and faculty expenses rather than about what is best for academic achievement for students.

The idea of combining Liberal Arts, Science, and Geoscience into a College of Liberal Arts and Sciences is a great idea. It would be nice to be a part of a larger college that could potentially gain and allocate more resources than a smaller college could. But the Department of Biology should remain within the College of Science, even if it is combined with arts and geoscience. Not having a stand alone biology department would make us an outlier among universities worldwide. There are no other examples in the top 150 universities besides Cornell that do not have a biology department. The Department of Biology is extremely effective and efficient. We have grow by 40% over the last two years, in number of students and hiring of faculty. We have done this with limited resources and without a 40% increase in staff hiring. So the statement that the department of biology is underperforming is blatantly false, and the comment itself has done more to hurt the perception of the department than anything the department has done. We have grown so much over the past few years and are on an upward trajectory with no end in sight, but moving biology to COALS would interfere with the momentum that we have gained thus far.

I am very concerned about the merger of Liberal Arts and Sciences. I have been at institutions that had combined and separate colleges, and from a student perspective I cannot say that I saw a difference. However, post-degrees I have seen great value in having a separate College of Geoscience (or similar). Though not chosen as peer institutions in the report, schools like UT Austin and University of Oklahoma have Geosciences colleges/schools that highlight the strengths of these programs internationally. Most universities do not have a college dedicated to Geosciences because they do not have a large number of faculty and programs, like atmospheric sciences and geology, are combined in a single department. Texas A&M's Geosciences program continues to grow in size and recognition nationally and internationally. Giving these programs their own college demonstrates the importance of this work at TAMU and will continue to attract students and industry recruiters. Yes, the College is small compared to others within TAMU, but I do not believe this adds layers of inefficiency. I work at the International Ocean Discovery Program (IODP), housed within the College of

Geosciences. This program brings in tens of millions of federal dollars annually and is the largest Geosciences NSF facility in the country. The current program will end in 2024 and I hope that TAMU will submit a proposal to continue hosting the program. However, this will require a lot of work by the Dean of the College. If IODP is brought under a LA&S college, I am very concerned that the Dean will not have time nor the interest to continue IODP. We need to have administrators at TAMU advocate for us and work with NSF. Losing IODP would be a major blow to the Geosciences program at TAMU and its prestige.

---

I agree that trying to reduce the redundancy in the life sciences is a good idea. I'm concerned about moving the department of biology to the very applied agency of AgriLife. The culture of the department as being focused on fundamental science could be hurt or underappreciated in that agency. Perhaps students interested in the life sciences in general could start in biology within the College of Arts & Sciences (where University Studies will be centered, anyway, in case they want to move more broadly), and then transfer to AgriLife later in their career.

---

I agree with creating a College of Arts and Sciences. Only concern is having a dean that has no interest or background in anything regarding Liberal Arts and vice versa. There must be a dean that can support and has knowledge of both. I love the idea of a school of visual arts. TAMU is losing students to other schools because it has no Music degree program, and yes visualization should be a part of School of Visual Arts. I also agree that a Department of Journalism should be at TAMU. I did not get my degree at TAMU for this reason. There was no Journalism degree at TAMU when I was going to college many years ago. I don't know about a new small animal hospital. I don't know how old the building is. Only if it is needed.

---

Climate change is an existential threat to Texas, Texas A&M, and the world, and however the geosciences disciplines are reorganized, their UNIQUE ability to tackle this huge threat must be empowered, not limited. Geosciences students and graduates are going to be the leaders who help the world deal with, mitigate, and survive climate change. Additionally, reorganizing three colleges into one College of Arts and Sciences solely for efficiency reasons seems to have many blindspots - what about the quality of the students' educational experience? How will we help students not fall through the cracks or not just be a number in a sea of students? Geosciences students LOVE their small college and deeply value being a Geosciences student. That is a value statement, and the monetary value of that attachment is going to be lost/damaged in this realignment. Also, the Texas A&M Libraries do not need to be moved or realigned. They do terrific work for every discipline on campus, and do not need to be changed. Adding a Masters of Library Science to TAMU would be a good idea, but otherwise please leave Libraries as they are.

---

Not Sure that combining Liberal Arts and the Sciences together is a very smart idea. Now you take away at least one Dean position. A Dean position is something all faculty members strive for. The opportunity to begun a Dean is something people will come to this University. I really can't see why a school with a major emphasis on Engineering and Architecture would even entertain the idea burying the Geoscience College in a Arts and Science College. Geoscience is a key component on which Engineering and Architecture are built. Not sure a four legged stool with the Health Science as a leg is a good fit for this University. Health Science is a pretty weak leg and one that struggles to be a team player with the rest of the University.

---

While I would always wish that the College of Geosciences could stay separate and not be combined, I know that will probably not be the outcome. With that being said, I would like to express my sincere hope that Ms. Barbara Bayer, Assistant Dean for Finance and Administration in Geosciences, would be asked to help lead the Business/HR part of the merger if it should happen. I have been employed with the College of Geosciences for nearly 40 years. In all my years, Barbara has by far been the best leader in our business area. She has reorganized our whole business structure and it has made us a cohesive team! She is smart, driven, organized and would be a tremendous asset for making this huge task a successful endeavor. She always thinks one step ahead. She has experience and knowledge in academics, research, financial/budgets, HR, etc. – all the areas that will be needed to make a transition of this magnitude.

---

About Recommendation #6 “Merge the University Libraries into the newly created College of Arts and Sciences and create a new Department of Library Sciences” This is a demotion for the Libraries. We have our own Dean and four Associate Deans. We function as a College in our own right with our Dean having decision-making and purchasing authority. The Libraries exist to serve and support ALL Colleges equally, we should not be absorbed into a single College’s reporting structure. To do so would create a conflict of interest in purchasing decisions and in priorities handed down to the five different Libraries faculty and staff. Putting a Dean of the Colleges of Arts and Sciences in charge of the Libraries (a Dean that I assume would not have a library degree) does serious damage to TAMU Libraries ability to recruit and retain top-quality faculty librarians. The Libraries should have their own Dean with decision-making and purchasing power. Perhaps the consultants don’t understand the difference between a library school (staffed with PhD faculty who

are tasked with educating future librarians) and the TAMU University Libraries, which operate with masters-degree-holding faculty and offer services, programs, and instructional/research support to graduate and undergraduate students and faculty in all the colleges at TAMU. There are already three well-established, American Library Association accredited, library schools in Texas with PhD-wielding faculty. Those schools are competing for enrollment. Texas Tech recently attempted to start a program but they were unable to obtain ALA accreditation. Texas doesn't need another school; there is no huge career market for librarians. The entry-level degree required for a career in libraries is an ALA accredited Masters in Library Science. There is very little career market for bachelors degrees in library science, so TAMU would be wasting its resources offering it.

---

Recommendation #6 - Merge the University Libraries ... I will preface my comments with noting that I work in the Libraries. When I read "rational #6" I get the sense the Libraries are simply an afterthought in this report. Someone disassembled the machine and when putting it back together found a spare part (the Libraries) and then proceeded to "find" somewhere to put us. This is evidenced especially by the statement "... offers an academic department home ...", as if we are homeless at the moment. I am not a librarian but understand there are multiple library schools in Texas. Referring again to the Bureau of Labor Statistics there doesn't appear to be an expected increase in demand for librarians (<https://www.bls.gov/ooh/education-training-and-library/librarians.htm>), simply the average for all occupations. I am skeptical that creating a Department of Library Sciences is a prudent course of action. It isn't clear to me if the proposed course load is simply formalizing the instruction and literacy outreach librarians are currently doing or is additional. If it's additional, there will be some significant offloading of duties (onto who?) involved in simply keeping the buildings open and the curation of the collection. Not everything is digital so we built a robust infrastructure to preserve collections and make them widely accessible. This work is ongoing so removing components (librarians) would negatively impact this work. During my time at the university I've heard people talk about "enterprise" services. I would submit that the Libraries provide an enterprise service. We are analogous to Switzerland - friendly with all parties but neutral. I fear this neutrality will be impacted, intentionally or not, by putting the libraries under the College of Arts & Sciences. Where will our loyalties lie? Do the favorite journals of the other colleges take deeper cuts compared to those of the arts & sciences? Would we then favor our own college's students (implicit or otherwise)? We have already established a learning commons with the formally named Business Library & Collaboration Commons. Absent the construction of an entirely new building we continue to collect input from our customers and adjust our services to be more in line with the learning commons service model. We continue to review collection usage and relocate unused materials to archival storage at the RELLIS campus. It takes time to clear space and then requires funding to remodel in a well thought out manner. We want to do this and have been working toward it within our means. Perhaps it was overlooked but the Writing Center is housed in the Evans Library and we provide them space in the Business Library & Collaboration Commons. This arrangement has been in place for years. We currently share conference rooms and coordinated with them during our last major remodeling project. Until recently the Office of Graduate Studies had offices in the libraries, this was a multi-year arrangement. We developed Vireo specifically for OGS to support the electronic ingestion and publication of theses and dissertations.

None

---

I believe the perception of the Biology department as underperforming is an outdated perception. Over the last few years, the department of biology has taken on more students and more faculty, all with no increase in staff. The staff in particular have shown incredibly efficiency and resilience during these increases and in the face of covid-19. In the face of the pandemic, the faculty and students of the department of biology have also shown incredible resiliency during a very difficult time. The rapid increase in students and faculty numbers, as well as the covid-19 response, have been supported by an entire department committed to excellence in research and education. Between teaching success and hiring new tenure-track faculty, the biology department is on an upward trajectory with a new department head at the helm. My comments are that I want to suggest the department remains as an intact department in the outcome of the changes across the university. It has an incredible team of people in every position, and there are many potential ways to keep growing with the teamwork and efficiency shown by this department. I have seen firsthand the collaborations and support from the College of Science for the biology department and my opinion is that losing that support could have a large impact on members of all departments in the new College of Arts and Sciences. Since 2010, I have been an undergraduate student, graduate student, and now staff member in the biology department. I have seen the commitment of its members, and the path of improvement it has been on for years in the College of Science and the university as a whole. I feel the best way to continue this growth is to keep the department intact, and to allow the

members of the department the chance to continue improving and working hard for this university that we all care deeply about. Thank you for considering my feedback.

I probably ought to say, I'm sorry that in the following words an evident train of thought may not be found :) Perhaps it will be more boring than nonsensical :) The first reference mentioned in this section is an article from the Chronicle of Higher Education, "Shared governance over time", which gives statistical information for the types of decisions with which faculty have been involved. Basically the next step in the Review is the recommendation to combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. In the early 1960's the College of Arts and Sciences was split into the three separate colleges. Faculty were involved in the decision in the 1960's, though probably with a limited purview (the questions they were asked to address), and it was the science faculty who were instrumental in splitting into individual colleges. The Department of Visualization uses computer software to model and create much of its content, as I understand. I wonder if more of their work is technical rather than performative. Concerning the Bush School, and I am sure this is known by many and may be mentioned by many, there is a small Policy Sciences and Economics Library located there that is part of the A&M Libraries and it has an important role of making books available to students without requiring travel to main campus and also for the librarian support available there for students. The Presidential Library is not part of the A&M University Libraries, not answering to the A&M Libraries and not funded by the A&M Libraries. Regarding Finding #6, having to do with A&M librarians and the library itself. I agree with the leading statement regarding information skills. I am not so sure how much can be taught in an individual library consultation. I was actually thinking about the classes that university faculty often request that the librarians teach, usually tailoring general library instruction with class assignments or purposes. A consultation is a scheduled meeting requested by student, staff, or faculty with a librarian, typically for guidance on how to research a given subject using library and other resources. (I myself support the software EndNote, so I also meet with customers in this way, however, typical consultations would be much more focused on library resources. Since I do not have these kinds of meetings and do not have as refined a sense of information literacy and its components, I am not sure I can describe consultations very well. They do seem too brief and limited in possible scope to help the students as much as possible or to meet the need or to convey the knowledge that is being given in consultations.) Though consultations may seem limited in time to fully instruct, going from what might be one hour of interaction to several meetings and several hours does not seem to follow. Reference questions have been declining basically everywhere since Google was established. I understand that there were internet search sites before Google, however, from the year Google was established, libraries have received fewer and fewer research questions. At the same time, when we interact with students or faculty and staff, it does not seem that they know the things we tell them in reference interactions. It is much easier to search Google and find some related information than it used to be to go to the library and find what books had the needed information. When libraries study what is going on with students (for example, Studying Students: The Undergraduate Research Project at the University of Rochester, an ethnographic study of how students do research) some sources say that students do not think of the library as a possible help with their schoolwork and it seems in many cases their teachers are not giving them an incentive or indication to visit the library. An established researcher working in their own field might not miss opportunities doing so, however, even an established researcher might be benefitted with asking at the library. Regarding recommendation #6, merging the libraries into the new College of Arts and Sciences, the library is busy with work totally unlike classes. Some library interactions can be educational and doubtless can be very beneficial for students' classwork, however, much of what is going on in the building with the number of students is studying without interaction with library personnel unless problems are encountered like too much noise. A significant use of funds and attention is paid to using the funds to purchase books and electronic resources (typically databases for finding journal articles and selection and purchase of ebooks). There are also one class instruction sessions and consultations taking place, but these may account for about 10% (or less) of the visitors in the building during business hours and maybe 1% at other times. In the Library Peer Institution Review, mention is made of the article by Bolin. She mentioned an article by Hill, "Constant Vigilance, Babelfish, and Foot Surgery: Perspectives on Faculty Status and Tenure for Academic Librarians". She makes a good case for the amount of work involved throughout the library to support those going up for tenure. Just commenting on her title--she is speaking of the vigilance required to deal with new administrators who are unaccustomed to libraries and what faculty status involves there. She mentions at one point that she did not like the idea of faculty status for librarians and yet now does. This gives the sense that it is not an overwhelming case for or against. Babelfish was a translation program on the internet that didn't always translate things right; and that goes with the need to explain what faculty status means in the library field; i thought her article did a good job of that; foot surgery had to do with the experience of fitting skates on

boots that did not fit and the harm that that caused and the relief in finding boots (a faculty process) that fit the library application. I wonder if the opportunity to provide a learning commons model will be very successful. As I mentioned, right now students do not seem to be at the library to work with library personnel or even make use of things the library makes available other than physical resources such as study space, study rooms, a relatively quiet area with snacks and coffee available; some students like to study around books :) To say, let's us two or three programs work together and really wow them; will they be wowed? Learning commons have been much-discussed and probably visited by many libraries. It seems surprising to hear about the library leader, once they're put into the College of Arts and Sciences will have the opportunity to try to make the learning commons successful.

---

Again, kudos for attention to the Liberal Arts. Journalism - YES!!!! Consolidating Biological Sciences offering. Expect hurt feelings. Proceed as planned. OUTSTANDING recognition of Library Sciences. Long needed. Longer deserved. TAMH - TAMU relationship is tense and rocky at its very best. Expect hurt feelings. Proceed as planned WITH ONE CAVEAT: TAMU has not sufficiently considered that clinical operations and the interface between professional health students and patients is VASTLY different from any other teaching field. Invest time and close examination to retain and expand needed clinical administration and compliance. Many health professions students work in academics, research and clinical practice all at the same time. We need cooperative convergence at the interface of the three respective management areas.

---

This does not impact me personally, but I could see how Liberal Arts folks are worried about being potentially buried in a College of Liberal Arts and Sciences. However, some folks have also noted that this works in other institutions. I think this, and all, decisions, should be considered in light to TAMU peer institutions, with specific examples provided and metrics reported as to how these mergers positively impacted all parties. The Bush School part makes sense, however, the creation of a journalism department seems strange, given that the journalism department was dissolved years ago. Again, it seems as though some of these recommendations were made without consideration of TAMU history or structures. I understand that data say what they say, but recommendations should be made with regard to previous initiatives, or at least recognition that some recommendations are in contrast to the way things have previously functioned. I disagree with the wholesale realignment of the health and kinesiology programs into the School of Public Health. Again, this makes sense on paper, but huge parts of these programs rely on knowledge and understanding of K-12 school contexts and early childhood and adolescent psychology, which is why they are currently housed in CEHD.

---

Finding #9d - moving the technology management degree to Engineering Technology may have a negative impact on the current degree seeking students. They are in an engineering degree program and receive an engineering degree. The Tech Management degree program has different standards for coursework that does not align with the engineering requirements.

---

Makes perfect sense to align Arts and Sciences. Many of our peer campuses have this model. By combining these two schools, they will make one of the largest in the university. Also, this is a much better alignment for student desires and make interdisciplinary work within the new college more effective.

---

I am concerned with how this would impact current employees positions. Would departments in turn be eliminated completely, in turn costing people their positions. Would people maybe be reassigned to other departments on campus to alleviate terminations? I believe it could be a good change because it can help with increasing our student count. I believe it could also give departments other opportunities that they previously wouldn't have had access too.

---

It feels, from reading this report that the major idea is to upgrade and realign to improve structure and focus the "professional" schools on the work of certifying professionals (Vet Med, Education, Mays, Architecture). It raises a few questions: Will faculty research suffer? Are there grants or funding sources that may be negatively impacted now or in the future? Will there be any negative impacts on recruiting high level faculty or retaining those we already have? I don't understand the use of the term "Institute" for Biological Life Sciences. What is the difference between a department and an institute that makes this desirable? KINE may be a good fit to Public Health and elevate it, but will there be negative impacts on KINE? Is this the best fit for student success to be achieved? Many colleges did not initially like the University Studies degree, but students have seemed to thrive with it. Housing it in one location with access to courses all over campus would elevate this program and add some consistency, possibly making it easier for students to access. If a new animal hospital is built, who will use it? Right now, the cost of using the small animal clinic is prohibitive. All the people I know won't take their pets there because of the high cost of services. Moving the arts to different locations focuses on our strengths and keeps them from being scattered across campus. Are there any discipline specific accreditation, THECB or SACSCOC considerations that may warrant attention before these academic shifts occur?

The academic realignments, where consolidation and regrouping were outlined, made sense.

---

Creating a fine arts program would be beneficial. With that there needs to be more marketing for that program as the Performance Studies department great students but they need to be promoted more to show how great they are at what they do. If that program is created I would want to see them have more availability to actually have a space big enough to perform. They are currently housed in the liberal arts and humanities building and only around 65 students are able to come see performances in the Black Box theater and they do not have a stage that makes them limited on what they are able to do. Rudder has wonderful performances and it would be neat to see more collaborations with those that put on performances there. I worked with Political Science and I think it is a great opportunity for them to merge with the Bush School. They use to be housed in the same building and it seemed like collaborations were frequent when I worked there. I do not agree that construction science should be taken away from the college of architecture. After speaking to some students/friends/colleagues from the college of engineering and some from architecture opinions and thoughts were that this would hurt many of those in architecture as construction science has a well established platform in architecture and this is the biggest major in the college with the most students enrolled. Engineering already has a vast amount of disciplines including civil engineering. What sets Construction Science apart is that it is more of a community and tight knit group. If we take away Construction Science and Visualization from ARCH there will be a lot of hits to the College of Architecture. As a university we need to show that each department/college/unit is valued equally and how these moves don't just benefit one entity. I don't see the benefit of Liberal arts and sciences merging into a mega college. It seems like both sciences together would align better as many of those in Geosciences take classes within the college of sciences, that would work better for both programs. Creating a big college does not seem like the best course of action in this area especially when we look at the enrollment of the "big" colleges we are looking at. Again as stated previously we are a unique university. If we look at A&M through a lens we are completely different than most universities and bring something that only land grant universities can bring to the table. What if A&M creates new systems that would be unique to universities of this size?

---

Rather than adding one or more required courses (in library instruction) to already heavily committed undergraduate coursework - and thus cutting number of elective courses further - expand existing embedded teaching programs and task the library, in partnership with academic department, to develop targeted online modules that compliment classes. This allows engineers to have information literacy teaching focused on their needs, and education majors to also have focused teaching. Requiring engineers to learn how English majors experience information literacy is a recipe for disaster.

---

Combining colleges does not reduce administrative structures: you can't expect the same number of people do handle triple to volume of work, as combining three colleges into one would require. I cannot imagine why in the world we would create a Department of Journalism. We used to have one and got rid of it not that long ago because of low enrollment. Why on earth would we bring it back, especially in the face of, as you say, "local newsrooms closing and downsizing at expedited rates." Is the idea for this department to single-handedly revive the local journalism industry? I genuinely cannot think of a legitimate reason for A&M to invest in this. If the idea is to provide good journalism for the good of the state, then create an institute or outreach program for it, but don't sink more money into a program that no students want to major in. The rationale for moving University Studies to the College of Arts and Sciences makes no sense. By that logic, you could move ALL degrees to that college because the College of Arts and Sciences would become primarily responsible for the university core curriculum. If students are focusing their University Studies degrees in a particular area, let them be in that area. The rationale for reorganizing the College of Architecture also makes no sense. Removing VIZA doesn't allow for it to grow, expand faculty, and position itself as a uniquely qualified to meet the needs of a very specialized industry. That's possible within the College of Architecture – it just requires an investment of funds and space, which the university could just as easily give to the College of Architecture. You don't need to move them in order to do that. The report mentions strong ties between Construction Science and various Engineering programs, completely ignoring connections it has with ARCH, LAUP, and VIZA within the College of Architecture. Again, there is no need to move this department.

---

Department of Journalism would be "brought back," not created. The Department of Journalism was dissolved in 2003. What would keep the same thing from happening again after effort put in to bringing it back. I am thoroughly against having all the sciences combined with liberal arts just to make a huge college. It seems like centralizing advising would

make advisors who are simply generalists, not particularly well-versed in any particular department.

---

Create a Journalism college. No I think not. The argument put forward jumped from a commentary about lack of trust in media to the unsupported statement about expanding a program. Instead the justification centered around the notion that "We" would benefit from greater media literacy. Training a group of media literate individuals just makes more potential employees for the current untrusted media. We'd do better to buttress a Technical Communications degree program oriented toward an employable skill. STEM as a goal set in a Liberal arts College is frankly laughable. The idea that we as an institution will benefit from this is also unfortunate. Liberal arts degrees aren't particularly marketable aside from within academics. The STEM goal set within visualization will be laundered to support non technical MFA programs in the fine arts. Unfortunately, I am acquainted with too many MFA's as it stands. This degree isn't particularly employable outside of Academics and as such shouldn't enjoy support. Construction Science runs a real risk of losing its identity to the interests of Civil Engineering. As it stands COSC is a management degree that enjoys huge support from constituent corporations that seek input into a product. (the Student). If they disappear into the juggernaut that is engineering, these students interested in management might as well get a PMP (project management certification). This is a functional degree. Cosc has a fairly active donor base. I wonder if a cost assessment has been performed as to foundation loss, and loss of donors to the College/University. The Department of Architecture lacks the leadership to be a world class organization. Restructuring is required. As it stands we've been unable to attract any valid Dean or Department head candidates for the last several years. In all honesty, this looks like creation of low hanging fruit to be eliminated in the future in favor of Architectural engineering. The idea that a stand alone college might perform better is ludicrous. We currently have a real 40 percent loss once you recognize that USAR is just the catch all for those who didn't "make the Grade". Our historical management has never been able to shake the cognitive dissonance that they get from reading their own press. They seem to actually believe it. The shop and Makerspace functions within the College will become low hanging fruit similar to the Technical Reference Center (TRC) and will be done away with in favor of Faculty interests. Increase the size of the Bush School? I am ambivalent about increasing the role of the Political Science Department in an organization that is successful as it is. Adding numbers does not increase excellence, it just lowers the statistical basis. Actually this is a prime example of a move to certify the notion that Texas A&M is good at being big, not at being good. A merger with poly Sci whose mission is supposed to be about education is nothing but a mission mismatch and a watering down of the Bush Schools nominal excellence. The notion that we are inefficient when it comes to the presentation of our Biology programs is disturbing. If our Biology department is inefficient then merge them or redistribute them to the two other entities. The idea that all will do well under a newly created Arts and Sciences department simply means that the various scientific interests of Agriculture, as opposed to Biomedical, will be generalized to a single interest set as is the case of other Universities like this. The "generalization" of Biology will result in the unintended consequence of weakening the support of Bio research in agriculture at a time when modern agriculture is most in need of the next technological leap. Our diverse interest set in Biology is a strength, not a "cost inefficiency". Merge the Libraries with the College of Arts and Science? Because we have Librarians capable of teaching. Not really, no. Our Library Staff are not big enough to stand up a Library Science Degree. Additionally, have you noticed that much of our teaching is done by instructors with masters degrees in a specialty, not by people trained as educators? It's one of the greatest fallacies in higher education in general, never mind by an institution with a tradition of education student with at least two classes a year taught by mostly English capable international T.A.'s. Alignment of Staff to a general titular organization removes them from the need to respond to the organizations they serve. A business office under FMO isn't helpful to a college in need of help. I suggest that the flexibility of local solutions might become problematic under a one size fits all staffing solution.

---

The idea of 4 mega colleges is interesting, but it reduces the strength of other colleges that aren't listed such as Mays Business School and Vet Med. These Colleges provide prestige to TAMU and have made names for themselves. Additionally, the University Libraries would die if it fell under the College of Arts and Sciences. The purpose of the Library is to be the indispensable Hub of discovery, learning, and creativity for the entire University. It supports both students and researchers across 7 buildings, and sites across Texas. If the Library is pigeonholed into a single college then thousands of students will not be supported. Additionally, an idea of an information resources program is different from the current function of the 300 plus employee population of the Libraries. The Library already has strong partnerships across campus with Engineering, Ag Life, HSC, Mays, and other groups such as the Writing Center, and the Bush School to provide information resources to the TAMU community. The Library needs to stand alone as its own College just as many other University Libraries are across the country.

This would take so much from each of the proposed colleges merging these colleges together. You can not evaluate or operate the difference between apples and oranges. ie- humanities and social sciences?

Recommendation #9d: Consolidate the Department of Health and Kinesiology in the School of Public Health, including clinical research associated with the Department of Health and Kinesiology. The rationale to move HLKN Dept from CEHD to SPH was narrowly focused on some perceived overlap of Health degree options. Given the number of students and multiple degree options within the department that includes health, kinesiology and sport management , it is worth looking at the entire organization in more detail. Also the HLKN Dean's office provides significant support in areas like academic advising and that needs to be taken into consideration when looking at moving the HLKN Department.

In regards to finding #9d, I would argue it makes more sense for the HLKN department within the College of Education and Human Development to absorb Public Health. HLKN serves 3400 undergraduate students, more if you include graduate students, and hundreds of faculty. Public Health is a much smaller program. Additionally, this finding and recommendation makes no mention of Kinesiology, PEAP, and Sport Management - all of whom exist within the Department of Health and Kinesiology. It makes absolutely no sense for Sport Management to move colleges which is why I think it would be better for Public Health to move in with HLKN. Public Health and Community Health are two completely different degree programs focusing on different areas of the health field.

Merging the science and liberal arts colleges isn't a good thing. It's better for a university to have a strong STEM program than strong arts programs. Improving the journalism program won't improve trust in news organizations for various reasons. It would be better to focus on writing courses in other majors, and improve job opportunities for those majors rather than wasting money on a journalism major. Science communication for example is something rarely discussed at A&M, and it would be better for a biology major to develop that writing skill and find that job than a journalism major. Merging the BIMS program with biology is a good idea if the degree maintains its flexibility. I chose BIMS instead of biology because all the elective credits I could choose what I wanted and was able to cater my degree to what I wanted to do. Incorporating a "create your own major" idea is good if advisors and career councilors can help you tailor your degree to finding a job.

I think considerable thought needs to be given to how we are styling colleges, schools, divisions, departments. It is clear from this report there was a general lack of understanding (particularly on the non-academic side) of the actual structure and the appropriate names associated with this structure. If the College of Arts and Sciences is created; there needs to be delineation about the structure at the next level. For example, the College of Arts and Sciences, School of Architecture. If that is the case, the Health Science Center should follow suit. The College of Health Science, School of Medicine. Or alternately, the Arts and Sciences Center, College of Architecture. Apply the same logic and styling to both. Liberal arts and sciences do not seem to mesh, in my mind. Science and Geosciences, yes. I do think it would be great to bolster performing arts and to establish a school of visual and performing arts (though I don't believe Texas A&M will ever be a leading school in this area.) I favor bringing back the Department of Journalism and partnering with others for this effort. Merging the Bush School and political science makes great sense, as do the remaining others.

Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. At face value this move presents a large opportunity for the university as a whole. I honestly believe that education and architecture could be further divided into what would become the remaining 5 colleges. There is a large overlap in education and what would be the Liberal arts and sciences so fully merging these would make sense. In the cases of departments like the Human resource development/ higher education administration group, they could be better suited in the Business School as their undergrads already require a business minor. Removing visualization from Architecture will dramatically shrink that college so converting it into a separate school within the Engineering super college. This would allow 6 large colleges to exist, the smallest being the Bush school. School of Visual and Performing Arts: This is a reversal of changes made 6 or 7 years ago that killed off the Performance studies department. Investment into the arts is critical for the development of a well rounded society. It is not a coincidence that the same age that brought us great thinkers like Copernicus and Galileo is also the time of Michelangelo and Raphael. re-Establish a Department of Journalism great idea. Increasing an emphasis on broadcast journalism, digital journalism, and photojournalism are needed.

Gutting the college of architecture is a giant mistake. Moving viz could make sense, but taking university studies and cosc would be terrible for the students in those programs. cosc would not get the attention it needs and deserves in engineering and those students would no longer benefit from all the interdisciplinary programs and classes they currently have. USARS moving does not make sense at all. these students are studying our programs, not some

generalized degree. it is the only way they can change majors while in school without starting over. COA is a 100+ year institution at this college and leaving us with only 600 students would be devastating to the level of education they receive.

My concern with the incorporation of more colleges under the Health Science Center campus is the lack of scholarship and grant funding available to students in the HSC. I work in the Scholarships and Financial Aid office and it is always difficult to explain to students how, though we are one University, the State of Texas sees the College Station campus and the Health Science Center campus as separate and, therefore, funds them separately. Students in the HSC are not eligible for Aggie Assurance, and we very often run out of Texas Grant funding for HSC students. Please consider the impact this will have on student financial situations before proceeding with this integration. There may definitely be an answer that I cannot determine from my viewpoint, but I wanted to express a concern that may not have been evident right away.

Recommendation #9a. Reassign the University Studies degree program exclusively to the College of Arts and Sciences. This could be a good reassignment to re-evaluate the degree plan requirements to ensure that students have more say in the degree setup and not have the degree solely used as a "catch" for students who can't get into other programs.

•The way the first recommendation is written makes it seem like this is a punishment to the School of Liberal Arts. If having the word liberal in the school's name is an issue, just make two separate schools. One of arts and one of Sciences. This is a good example of a recurring theme in this report where Texas A&M is being recommended to fit into a mold created at another institution without considering what makes these entities at Texas A&M unique. •Make the School of Visual and Performing Arts and make it a priority. Same with Journalism. Put the same resources towards these schools as you would any school in Engineering and they will pay enormous benefits. •Do not make TAMU Health into the UT Austin Medical System mold. •Before removing the undergraduate component of the Vet School, please consider the students who are on the accelerated 5-year plan. Programs that attract competitive students like this are what make <sup>T</sup><sub>SEP</sub>•The reorganization largely makes sense, with the exception of Marketing and Communications with is a whole mess. Texas A&M unique.

In my opinion merging departments is not so effective. However, some units may be transferred between the departments. These are the units which are not the core units of the departments

I mostly agreed with the recommendations in this section of the review, however, I don't see A&M expanding the arts curriculum. That would be understandable since A&M was founded as an Ag/ENGR school and is still widely known for that. I do believe moving visualization out of architecture would be helpful and give it more opportunity to shine on its own. I'm surprised A&M doesn't capitalize more on the successes of visualization graduates. Also, if creating a "standalone" JOUR department leads to better communication and programming from the KAMU team, then do it.

I think this portion of the suggestions will probably anger the most people. The School of Visual and Performing Arts makes sense as those degrees mentioned are absolutely redundant and confusing for students, but the department of Journalism makes no sense to me. There was a journalism major at TAMU within COMM and it was not successful, and there is currently an Agricultural Communications and Journalism degree within the College of Ag and Life Sciences that does all of the things that were communicated in recommendation #3 successfully but is ignored by this "comprehensive" review. The Bush School is a wonderful addition to campus and should be treated as such. Right now it is viewed as a separate entity and bringing it under the larger umbrella and focusing on its needs and capacity will provide a wealth of knowledge and opportunity to the students at TAMU. There have previously been issues with POLS department and other departments on campus with resources, and combining them could eliminate some of the potential crossover or competition for faculty, the Bush School has more prestige. There are too many crossovers and redundancies in faculty placement within what would be included in the new Institute of Biological Life Sciences. This compilation makes sense. Bringing Health services under TAMUHealth makes sense. Bringing HLKN into SPH makes sense, but will cause distention and anger. Moving the University Studies degree program exclusively to the College of Arts and Sciences eliminates opportunities for students to be in a US\*\* degree within the other colleges, which seems exclusionary instead of inclusionary. Each college keeping one or multiple US\*\* degrees makes sense because while the university core curriculum is necessary, it is also not the part of the US\*\* degree that makes them "Build your own".

The combining of biology programs makes sense. Primary alignment in AgriLife does not. Primary alignment should be reversed so that it remains in the College of Science (or Arts and Sciences) with strong ties to AgriLife. Several of the findings in #9 (such as removing Vis Lab and Construction Science, highly regarded programs from Architecture) would appear from the rationales to be a case of trying to fix what isn't broken. Are those programs part of what kept

## Architecture in the top 25?

I really had to think on this one. I do agree with the overall goals of the realignment and turning the university into a STEAM university. I think it would be a fantastic boost for the university as a whole. I'm just not for sure I 100% agree with all of the realignments.

I believe that some of these changes would be good, however, some of these may not be so good. I don't think that all of the Colleges should have their programs taken away from them but some of them should. I believe that we should form a journalism major and that we should have fine arts. However, I am not sure about HLKN being taken away from Education. I don't want people to lose their jobs during the restructuring. There is a lot of good staff and faculty members in the departments that will be eaten by other Colleges or realigned, and I don't want them to be punished.

Based off of the first line of Rationale #9a there seems to be a serious misunderstanding about what the University Studies degree program is. Contrary to the opening line of Rationale #9a University Studies is an actual degree program that conveys a BA or BS in University Studies. Additionally the program is not filled with "students who do not have the qualifications or interest to enroll in a College degree program". It IS a college degree program. Like any major there are borderline students, but the majority of the students in University Studies are good students who either had a rough start, transferred in with too many hours, or are pursuing a career that does not have a corresponding major at TAMU. I find the characterization of the students as lacking "qualifications or interest" to be offensive to the students in the University Studies program. Additionally this characterization indicates a lack of due diligence on the part of the consulting firm. They clearly did not research the program enough to discover that the University Studies program IS a degree program. Nor did they actually produce any data to backup their negative assertion of University Studies students. The second line is little better than the first as it states "The program staff can work collectively with all University Studies students to develop plans of study that meets expectations for both student and institution." This is already what University Studies staff do. Each degree plan is customized to the individual student based off of their career goals. I find it insulting the consulting company recommendation is what we already do on a daily basis. Based off of the work that appears to have gone into this single recommendation one has to wonder if the other recommendations were as poorly researched and composed as this one. If it was important enough to suggest reassigning University Studies it should have been important enough to do actual research and review actual facts. Talking with staff who work with the University Studies program seems like it should have been the first step before making a major recommendation. There are undoubtedly issues with the University Studies programs as there are with all programs. But actual research and actual suggestions would have been more useful than insulting the students in the program and suggesting that the program be housed in a centralized college and operated the way it is currently operated. An actual recommendation would have been: build in entry seminars and capstone seminars to assist in the difficult task of assessing such a flexible program. Instead the consultants disparaged TAMU students and suggested that the program be centralized in a single college and operated as it currently is.

While consolidating some of the colleges looks daunting, it is, as noted, a progressive trend in higher education. In addition, merging the Department of Political Science into the Bush School is a recommendation that makes perfect sense given the nature of the work.

The timeline for academic realignment should be reconsidered - it would be more beneficial to the university as a whole to implement these changes either during the summer or spring semester due to impact on faculty, staff and students (especially incoming freshman).

My question with centralization of academic advisors is that if everyone is centralized into one area, would that cause some people to lose their job because you don't need 4 advisors from one dept to advise. I also think that having the advisors in the dept is extremely important, but the biggest concern is putting a large amount of people in one location would that cause us to lose our jobs.

Very insightful. Good luck with making that happen.

This section has a lot of recommendations. While the concept of having a few large colleges sounds good, this is a large amount of change. I would be shocked if this level of change could be accomplished by September 1, 2022. Each one of these findings and recommendations is fraught with difficulty and will be hard to accomplish. Recommendation #1, combining Liberal Arts and Sciences to one college would be a big move and would take a long time to accomplish. I believe at one time these were one college and were separated. Recommendation #3, we used to have a journalism school, it wasn't profitable and was closed. Recommendation #4, clearly the report writers know very little about the

Bush School and the school of Political Science. Recommendation #6, the role of the University Libraries is clearly misunderstood. There seems to be some contention with the fact that many Librarians are faculty, yet they do not "teach". Clearly the role of the Library and Librarians is misunderstood. The Library provides a large number of services that many don't realize and regularly collaborates with places like the Writing Center. Moving the Library under a college would present a potential conflict of interest. Student success is tied to an open library that reports to the right people to ensure that the focus is on the students and not one department.

---

Do not realign Biology into Biological Life Sciences and one major/area - this is not a good idea in that many of the students DO need a separate College to handle their specific focus of a major. It would be a better change to start early with educating advisors on the possibilities of majors

---

Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. (pp. 24–25) Recommendation #2: Establish a School of Visual and Performing Arts with new departments in music, performing arts, and fine arts, and relocate the Department of Visualization to anchor this new school. (pp. 25–26) Recommendation #9c: Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning. (p. 37) I support these recommendations. There is a tremendous amount of interest from current and prospective students--as well as potential donors and investors--in using technology in the arts. Texas A&M is quite strong already in the STEM disciplines, and it makes sense that it would also be strong in complementary STEM-based artistic areas. Indeed, this could be a point where Texas A&M really shines. Arts technology is also an area that lends itself very well to collaboration between various departments and fields (e.g., electrical engineering, computer science, acoustics, design, and so forth). Developments in arts-related technology can also bring in tremendous amounts of revenue. As a classic example, Stanford University made over \$20 million from licensing a single music technology patent. It was the FM synthesis patent, licensed to the Yamaha Corporation back in 1975 (the technology was developed by John Chowning, while researching at Stanford). The patent remained the second biggest money maker in campus history until it expired around 1995.

---

It is noted that the university will combine liberal arts and sciences and I think that will leverage the budget for liberal arts but may provide a breeding ground for leadership competition and faculty hiring preferences. I may have missed it but where does Mays fall into this realignment? I see that there will be a focus on the "four legged stool" but no mention of Mays's position within the university. The department for performing arts would be a big undertaking. Our "rural" location does not provide the performance opportunities such as Houston, Austin, or Dallas. I think most performance majors would choose a university closer to a larger city and this endeavor may not provide the ROI needed in order for it to be created. There would definitely be a need for some multidisciplinary degrees within that college - design, stage constructions, sound engineering, stage management, etc.

---

I agree with the new college alignments with College of Arts and Sciences and changes with School of Public Health. I was 10 years at SPH - its terribly run.

---

I agree that some realignment needs to happen: working in Biology in three different Colleges is madness. Kinesiology is not part of Education- most of their graduate work will happen at the HSC. As a former dance student at Texas A&M, I'm interested to see how a School of Arts would perform with the current population- PERF has been riddled with issues, not having a permanent head in years, constantly having to reach outside their department for an interim, and losing three assistants to the head in a row to positions in the Dean's office. I also think bringing back Journalism is a great idea- as a local, I know many of my friends from high school who went to tu not because they were Longhorns, but because they wanted to work in marketing or journalism and when Mays declined them, they went elsewhere. Now, where I received my degree and currently work.... Liberal Arts needs some work. After years of completing external reviewer charts I know that Arts & Sciences is common even if it sounds unusual. I would not have any worries about Economics in this- we make a ton of money, especially compared to our other humanities colleagues. However, if you're shuffling CLA departments, I would argue that POLS and ECON both belong elsewhere. Even as a student here, I thought that to get into the Bush School you majored in one of those then when on to a graduate degree in that School. I was not aware that those two departments were shunted across the trains tracks as lonesome members of the College of Liberal Arts. If ECON were not to move to the Bush School, I would ask to consider us moving to Mays. While not my favorite college, one item we are asked when posting positions is what type of college we are associated with- a prospective graduate student or faculty member will choose a lower-ranked business school based economics department over a higher-ranked liberal arts based one. I would also note, the faculty from other departments we work with the most are (in order): Public Service and Administration, Ag Economics, and Statistics. None of these are in the current CLA and only one (STAT) would be in the proposed College of Arts & Sciences.

[REDACTED] I am also a former student, class of 2008, graduating with my MBA this December. 12th Man Productions would be willing to do whatever it takes to help establish a department of journalism. Personally I specialize in broadcast journalism, [REDACTED] 12th Man Productions already has one of the best facilities in the country, and I think we could really help build up this revamped department. [REDACTED]

The recommendation to create a School of Visual and Performing Arts is a great one! The Department of Visualization has long felt like the red-headed step-child in the College of Architecture. Many prospective students don't even know that Visualization exists as a degree option for them because it's hidden away in a college that they aren't looking at. A large number of students only learn about Visualization after enrolling in a different program at A&M. For many of those students, this costs them time and money, and in some case, the chance to enroll in Visualization due to having too many hours. Being realigned with programs more related to Visualization would help make the program more visible to prospective students. It would also allow for new courses and even degree programs to be created. Visualization students would have easy access to courses, facilities, and resources that aren't currently easy to find or access. All of this would help Visualization to grow all its programs and be competitive in recruiting the best students from Texas, the US, and around the world.

The rationale behind colleges having their own academic advisors is to ensure that those advisors are experts in those degree programs. It will be more than difficult to keep students on track for degree completion if all academic advisors become generalists. The Change of Major process is intended to have several steps to ensure that the student takes time to consider the change, and that they will still graduate within a reasonable time. In the past prior to the current process students would take 5 plus years to graduate due to changing majors multiple times. The College of Science and the College of Liberal Arts are currently separate due to size. Will the University be hiring additional staff and faculty to accommodate growing enrollment and the merging of these colleges? Adding a Journalism and Library Sciences programs will justify the need to grow the support staff for the merger. Regarding the proposed College of Arts, is there current demand from admissions? Where is the data supporting there would be students to justify the creation of a new college? University Studies is housed with TAP at present with Student Success. Will all of TAP move to the new College of Arts and Science or remain with Student Success? In addition, adding cultural events and opportunities to help retain faculty and staff will have little to no impact with the cost of housing in the area.

Some of the recommendations for academic realignment are clearly needed where very similar programs can be more closely aligned to achieve efficiency and synergy. However, the primary arguments for a combined College of Liberal Arts and Sciences are weak and superficial. These arguments seem to be that a) bigger is better and, b) TAMU needs to look more like other universities. A bigger college does not provide a better experience for students, as I have observed while watching my own son struggle to navigate the College of Engineering at TAMU. On a related topic, centralizing academic advising would only make this worse; academic advisors with specialized knowledge of the college or department are often a student's closest ally in the struggle. One reason that TAMU doesn't feel like a very large university has to do with the many smaller academic communities in which students reside. The College of Geosciences is a great example of an academic unit in which students benefit from being known and supported due to its small size and hands-on involvement of faculty and staff. It is also a unique feature of the university not found in many others across the country and an anchor for world-class international research programs such as IODP. How does TAMU stand to benefit by looking more like other universities? We have a unique origin story as a STEM-focused institution. We need to continue to leverage and build upon that reputation and strength. Instead of hiding the sciences in a larger college with liberal arts, we should seek efficiency and synergy that elevates the stature and quality of the sciences and highlights our unique scientific assets.

I fully support all of the recommendations provided by MGT as it relates to Academic Realignment. I do not work in that arena but the recommended solutions appear to address the reported findings.

My primary concern is with Recommendation #1, that combining colleges will undervalue staff in the process and the university will suffer brain drain and the loss of many qualified members. I also want to recommend that the College of Geosciences be used as a model example for structure and efficiency where staff are highly valued, invested in, and retained. Didn't TAMU eliminate Journalism 15 years ago because it was failing as a department?

I think that the creation of the College of Arts and Sciences, creation of a Visual and Performing Arts unit, and bolstering the Bush School are all excellent ideas. The organization and day-to-day functions of many departments are still

engrained in the idea that "we should do things in this way because it is how we've always done them," but that kind of thinking does not lead to innovation or efficiency. This university as a whole could really benefit from restructuring that maximizes talent and effort. However, I think that climate will be a large challenge to making these changes. As the report briefly mentions, many faculty and staff are on the older side and may be on the cusp of retiring or are not open to the idea of changing how they do things (in my experience). My department in particular has had many faculty retire over the past couple of years and has not been given the opportunity to hire new faculty to replace the gaps in the curriculum retirees have left behind. In addition, when a staff member leaves/retires, there is no evaluation of whether or not we need to replace that position; positions are always renewed in order to retain budgets. Duplication of effort is a huge problem in staff positions and many efforts at significant change are abandoned because approval processes involve so many parties and move so slowly that, in the end, nothing ever changes.

---

I am not in a position to provide good insight into these changes.

---

I have not had any interaction with them

---

I found moving the University Libraries into the new super Arts & Sciences college showed that the consultants did not have a good grasp of how the Libraries operates and who we are. It seems that the consultants did not deeply assess us as an entity on campus. They did not notice that we already have great partners across the campus, one library has collaboration commons in its name, nor that we have the University Writing Center embedded in two separate libraries. It was also very disappointing to see our special collections library, Cushing Memorial Library & Archives reduced to being seen as a potential museum, ignoring the fact that it is the home to the University Archives and more importantly, all of the important research that occurs in Cushing because of its unique collections. The report also does not recognize the important work the Libraries does in DEI and the impact their work has on campus climate. It is a shame to see the stature of the Libraries diminished rather than this being an opportunity to provide the Libraries with even more resources because we have a unique position to directly effect student success in many ways. I hope current administration creates an opportunity to supplement the information presented by speaking directly with the Libraries Administration to gain a more accurate understanding of the Libraries.

---

WRT Journalism, please be sure to include those with a historical memory of why the Journalism Department was shuttered in the early 2000's - no need to repeat the same mistakes less than two decades later. WRT HLKN moving under SPH, once again, one really cannot see what that will look like from the consulting report, so I would like to see a more concrete example of how that would happen and what it would look like before commenting. I do agree there is significant overlap in the two programs. What happens to the Byrne Center for Academic Success if HLKN leaves COE?

---

I will leave academic areas to the academics. Finance is really a service function to enable proper resource allocation and budgeting. We need to know the mission so that we can enable success through proper allocation of financial resources.

---

Makes sense to reduce the number of colleges and also has the potential to reduce the silos of disparity between them as well.

---

Generally support consolidation of colleges

---

Why do we need a new "mega-department" of Arts & Sciences that will potentially drive decision-making due to its large size? Different is not always insufficient. If the university currently does not have students asking for degree opportunities in journalism, what is the rationale for creating and staffing an entire department of journalism? Considering that such a department would be new and unrecognized, recruitment of students would be challenging.

---

There was ALOT of talk about growth and continued growth. My opinion is that the recent UNCONTROLLED GROWTH has lead to the problems we have now. Massive uptick in student enrollment WITHOUT increasing staff and upgrading infrastructure got us to where we are now. Has ANYONE thought about putting on the brakes (slow down the growth) for a little while until we can get things in order?? Growth without proper processes/procedures/staffing in place is a recipe for disaster. Another example of this is that house pricing in CS has FAR exceeded salary adjustments and widens the divide of people that we can attract to this area. Low PAY, High cost of Living not sustainable.

---

Some parts of this plan make sense, however others, like moving Biology out of science do not. We had a wonderful Journalism department in the past, but struggled with provided enough sections for upper level students to complete their degrees on time. It would certainly be good to apply Aggie ethics and values to journalism training again. I have concerns that combining too many colleges into four areas could create huge bureaucracy similar to some that is being

torn apart by these recommendations. It seems almost contrary to the rest of the report.

---

Major concerns are of overloading the workload capacity for existing staff, losing staff and losing the current structure which is working efficiently

---

The Texas A&M Political Science Department was recently rated the #13 Political Science Department in the World. The report is correct that the department could benefit from investment in faculty and programs. Being under the College of Liberal Arts has provided minimal funding opportunities for this department and prevented recent faculty hiring and retention of diverse faculty. However, realigning the department under the Bush School is not a good move. The department would be lost in the Bush School's strain to reach its "full potential" and good faculty will leave. The department has an excellent graduate program. These students have chosen to be POLS students, not Bush School students. The Political Science faculty currently have a first class business hub, shared with Economics, that meets their needs in a timely and efficient manner. The staff are cross trained which limits the lag time in case of absence. The business hub has implemented a paperless environment utilizing shared drives for retention of account files and graduate student personnel files. The major reduction of paper purchases alone created a significant cost savings. If realignment is necessary I feel that Political Science and Economics would be a better fit within the new College of Arts and Science.

---

Since I'm doing research, I will comment on academic realignment focusing on Recommendation #8: Improve research organization at TAMU-Health. The recommendations are overall reasonable with great intentions. However, the suggestions about IBT in Houston are rather shocking. It is a fact that, compared with University of Texas, TAMU has much weaker presence in the biggest city in Texas and the world's largest medical center. Instead of moving out half of the research groups to other places, I feel strongly that investing more by TAMU to expand IBT is urgently needed and will only make TAMU stronger and better known both nationally and internationally. And relocating many labs at the same time is always a terrible idea, which will lead to nothing but loss of PIs especially those who are doing really well. I would like to recommend streamlining the structure of IBT's to let us devote more efforts towards drug development.

---

combining these Colleges into a single bigger/stronger College, does sound like a positive change. What doesn't sound positive is the decrease in moral amongst the staff within these Colleges. Loss of identity, feeling of failure, uncertainty for the future etc.

---

Sciences should remain a stand alone college because: 1. Texas A&M Strategic Priorities guide the campus to produce highly trained professionals in a specialized field of study. Combining Arts and Sciences would detract from the specialization 2. A combined 'mega college' may contribute to students feeling like a number vs. a unique voice. 3. The Sciences contribute support for furthering research in various disciplines... engineering, natural resources, bio-innovation, and more. An alternative consideration may be to advance interdisciplinary offerings by assigning the Liberal Arts 'major fields of studies' accordingly into the college of Education and Human Development (E&HD), college of Geoscience, college of Science, college of Medicine.

---

Combining of the smaller colleges to make the 4 major colleges could be better for students to take classes in the departments of their choice without going outside their Major. It may help the finances of the smaller colleges and possibly help them reach students they normally do not reach because of the decentralization.

---

None

---

8: Rather than, or in addition to research organization at TAMU Health, TAMU Health could benefit from a greater focus on support for pre-award and post award administrative services. See CERD within the College Of Education and Human Development for a model of these services. 9d: Health and Kinesiology is more broad than just the division of Health Education and the School of Public Health is more broad than just HPCHS. While there is overlap with Health Ed Division and HPCHS, combining all of HLKN with SPH fails to recognize the needs and expertise of the other divisions such as Kinesiology or Sport Management within HLKN and Epidemiology or Environmental/Occupational Health within HLKN. This recommendation only considers a small portion of the larger entities.

---

Recommendation #2: If A&M can get the buy in from the state to allow for this, I think it would be really cool and help A&M compete more with UT; I would have been able to consider coming here as a student. If not, I still think moving Visualization out of Architecture makes a lot of sense. (It might make sense in the College of Arts and Sciences.) But it's also worth saying that Visualization has been struggling in recent years due largely to decisions and management within the department and may not be as effective at anchoring a new school as you might hope. Recommendation #3: I think this is wishful thinking, like it would be nice if this existed, but all of the reasons listed as motivation to have this

---

department are perfect examples of why the department would likely fail. I think we'd be better off just trying to get the existing program ACEJMC accredited. Recommendation #5: I think a solution to make all of the entry-level biology classes be the same so students can transfer more easily is spot on, but the name "Institute of Biological Life Sciences" seems to be at opposition to the definition of "institute" by TAMUS, making things more confusing. I don't think under the existing definition academic programs and departments can be part of an institute, and if they can, that's very confusing. Recommendation #6: Merging the actual libraries into one college could create unnecessary turf wars. Creating a Department of Library Sciences and letting librarians teach some classes as appropriate would be fine though. Recommendation #9c: Taking away BOTH Visualization and Construction Science really makes the College of Architecture (COA) barely a college any more. (A college with only 1,000 students? Wouldn't that make it the School of Architecture?) Construction Science is by far the best program in the COA and taking it away would really weaken the college, especially since the architecture programs are performing very poorly and are not accredited. If the ultimate goal is to let the COA die on the vine, I get it, but I think you should be aware that this is a distinct possibility if you split up the college that much. Construction Science also wouldn't get to shine as much if it was in the College of Engineering. Recommendation #9d: the engineering requirements would eliminate a lot of students who would excel in the Tech Management program.

---

Aligning to the four pillars similar to other schools makes sense. It should create some synergy and reduce redundancies. Also as mentioned above, break down silos.

---

Academic realignment to some extent might be useful / fruitful, but not to the extent in which this report describes. I will elaborate further on this in general feedback.

---

- The recommendation to create a new College of Arts and Sciences makes sense - Elevating the Bush School will yield tremendous value to TAMU; integrating Political Science will provide a wider reach of this program and better experience for TAMU students - It is unclear what value will be created by moving Construction Science to the College of Engineering

---

I disagree with moving the visualization program although could live with that. Also disagree with realigning the construction sciences program. The latter fits well where it is for the same reasons listed for realignment. In the end, I'll defer to the CS or COA leaders.

---

I think the academic realignment may not be super popular, but it will be a good thing for the university. Oftentimes small units are dwarfed by others, and this could be an equalizer of sorts, leveraging the resources, the voices, and the direction of multiple essential units by combining them.

---

I completely agree with the recommendations of alignment. Having been at FSU (Tallahassee) and the University of Florida (Gainesville) for 20 years, I completely agree with the concept of a College of Arts & Sciences. I believe each of the colleges will elevate the other(s) and will raise retention/graduation rates in the process. I also believe the College of Geosciences will be able to be featured more prominently and that finally the University-at-large will recognition the contributions made by faculty, staff, and students.

---

Redundancies are plenty at A&M so this all made sense and projected to make A&M more efficient.

---

N/A

---

The College of Engineering already struggles to provide adequate advising to its students due to its size---this is an issue that even prospective students know about (my parents both teach at high schools in Texas and have parents complain that their student's cannot meet with advisors). By creating another mega-college (arts & sciences) you are going to duplicate these issues by creating another mega-organization that inadequately supports student advising.

---

While it is logical to integrate Health and Kinesiology into SPH to attempt to access HRI formula funding. The missions, activities, and methods of these departments are entirely distinct. As an alumnus of SPH, I will say Public, population-level measures attempt environmental interventions to eliminate disparities among populations. I.E. Clean Air, Clean Water, Ergonomical Health and Safety, Management of Care in Hospital Settings, Policy Analysis, etc.....in short, Sickness treatment and disparities at a Population Level. Health and Kinesiology is the creation of Health, and Healthy Educated Individuals knowledgeable about their bodies, and active in motion to create and improve health. Nutrition, Biochemistry, Exercise, Injury, and Motion studies of physical activity and movement and Health. It is understandable to perhaps look for a better fit than the College of Education, but the answer is closer to Biology, Anatomy, Chemistry and Physical Sciences than it is to Policy Management, Population Sickness Interventions, and Healthcare delivery.

As a former student that felt rushed to choose a major and ended up confused about which degree plan was right for me - I agree with many points under the Academic Realignment section, including combining the Arts and Sciences college and having centralized advisors, the move of HLKN to the School of Public Health, and having general studies under Arts and Sciences. I was in general studies for just one year before I was told to choose a major. I knew I loved the Sciences, but also felt outside pressure to do a pre-nursing school degree track for the money and to please others. I rarely had access to my advisor and it felt like my advisors changed many times during my 3.5 years at TAMU. I was encouraged to choose the Allied Health degree, and didn't find out until my senior year that it was mostly appropriate for those that knew they wanted to get an additional degree (like BSN) after leaving Texas A&M. It would've been wise for me to get a degree in Public Health or Community Health. It also would have been nice if I could have taken more general science courses my sophomore year so I could discover what I truly enjoyed, rather than having to focus on specifically pre-nursing courses before I was able to realize I did not want to pursue nursing school.

I think that bringing PoliSci within the Bush School is a great idea. There are duplications in programming and services that could be reduced and made more efficient. The two colleges reach students with similar interests and life goals. Expanding the Bush School would elevate the status of the school and better enable Texas A&M to train the next generation of government leaders.

Several of the proposed changes do not seem to fit together academically, and will create a huge administrative nightmare when it comes to faculty tenure decisions, appointments and teaching loads.

I agree with a support the recommendation made by MGT. I'm interested to learn more about how Mays Business School would or would not play into the four-legged stool approach.

FOr

N/A

As a Liberal Arts graduate of TAMU, I actually like the proposed merger. While it on the face of it seems controversial, it brings us in line with peer institutions and if it allows for increased and targeted investment and eliminated of inefficiencies then it makes complete sense.

WHILE I UNDERSTAND THE NEED TO CONSOLIDATE AND REALIGN SOME OF THE COLLEGES AND DIVISIONS, I THINK FOUR AREAS MIGHT BE A BIT TIGHT. I WOULD ENCOURAGE ANOTHER LOOK AT SOME OF THOSE UNITS THAT FALL UNDER ONE OF THE PROPOSED MASTER HOUSES AND SEE IF THE CURRICULUM AND FACULTY FIT WITH THE MISSION OF THE DEGREE PLANS.

I agree with the findings in this section.

## Academic Realignment - Student

Please provide your comments related to Academic Realignment:

In regards to Recommendation #1, Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences: I am vehemently opposed to this, and to the creation of a "four-legged" stool concept when it comes to consolidating colleges. TAMU is already too large in the student population size, and there is an issue in the larger colleges -- such as engineering -- when it comes to students finding a sense of community. By combining liberal arts and sciences, we further push an agenda that TAMU is only focused on STEM, when in reality, we are focused on building and developing leaders who will impact every facet of the world after graduation.

I am currently a Jr. Geophysics student in the College of Geosciences and as soon as I heard that the likelihood of my college being taken away and being combined with liberal arts and sciences I was devastated and thought about how much I wish I could go back to my senior year of high school and accept my admission to the University of Texas instead. I chose to come to A&M for the amazing opportunities I would have within the College of Geosciences and for the first 3 years of my time at A&M I have gotten to and am going to get to partake in those opportunities. However, it saddens me to think about how different and scary my senior year is going to be. If I had known I wouldn't get to graduate in the College of Geosciences I wouldn't have applied to A&M at all. I chose this school and to apply to UT in order to be in a

college dedicated to just geosciences. With this potential change I have so many fears and unanswered questions that have been causing me to much stress. Will I lose the advisor who has gotten me through countless hard classes and academic situations? Will my diploma not say "College of Geosciences" on it? Will I lose my job and research position within the College of Geosciences due to cuts being made? I urge you to rethink merging the College of Geosciences, the College of Sciences, and the College of Liberal Arts. I believe that it is so important for geosciences to have its own college due to how diverse and important geosciences is. We are important for taking care of our planet, drilling for oil to fuel things, predicting natural disasters so people can better prepare for them, etc. I think people tend to forget just how important geosciences actually is and due to this importance I think that the College of Geosciences should not be taken away. I noticed one of the reasons for this college merger is due to the Liberal Arts College needing more support in a STEM university. I disagree with this. I am a part of a college with around 1200 students, which is by far the smallest college on campus, and am also in a major with approximately 8 people in my graduating class. While we are small, we are also well taken care of and very well supported. My advisors and professors know who I am, how I am doing in my classes and personal life, and don't forget me as soon as I am done with their class. I have professors from two and a half years ago who still know who I am because of how much they actually care about me and my education. The size of my major and college doesn't hinder my experience at Texas A&M but instead helps it. I love being in a small college and it has never made me feel less supported. I have also talked to my Liberal Arts friends and none of them agree with this merge either. I do not understand where the idea that these students aren't being supported came from. In your report you said there are around 9000 Liberal Arts students. That is about 7.5 times as many students as the amount of students in the College of Geosciences. I urge you to rethink if they are going to benefit from this merger or not, because from my perspective and many of my peer's perspectives we do not agree that these liberal arts students are going to benefit from this merger in any way, shape, or form. However, in the case that you do decide to merge the colleges I would like to put in a few requests that would make it more comfortable for me and the countless people I have talked to within the College of Geosciences. 1) Many of us (including myself) would like our diplomas to say "College of Geosciences" on it and not "College of Arts and Sciences". If it is possible, would seniors graduating in fall 2022 and spring 2023 be able to have their diploma still say "College of Geosciences" on it? We will have spent 3 out of 4 years in that college and since we didn't have any say in this college merger we think we deserve to have our diploma say "College of Geosciences" on it still. (I am also worried about how "College of Arts and Sciences" sounds less professional on job applications than "College of Geosciences" and if this will impact me in interviews and future endeavors because it makes it sound like my Geophysics degree came from an art and science school and I am trying to be a scientist and not an artist). 2) My advisor (Mrs. Rosser from the department of Geology and Geophysics) has been one of the biggest helpers in my time here at A&M. Everyone in our department would like Mrs. Rosser to continue to be the advisor for geology and geophysics students. So, if it is possible to keep her as my advisor it would make the change a lot less scary and a lot less stressful. Without her I am honestly not sure what to do with the rest of my time here academically. But if she stays my advisor I know I can get through it somehow. 3) Please do not cut down on the amount of research within the College of Geosciences. I am so scared I am going to lose my job which is not only one of my sources of income but it is also an amazing opportunity I have as gaining experience in my field. I currently work as a student lab tech in Halbouty and because of this I am gaining research experience and job experience since I am on payroll. Losing this job due to research being cut from this college merger would be devastating and would cause me and so many others to lose opportunities at grad schools and gaining experience. So many grad schools want their geoscience graduate students to have research experience so it is so important this isn't taken away from us. So, if you merge the three colleges please do not cut down on how much research the College of Geosciences and geosciences students are a part of. Thank you for taking the time to read my thoughts on this proposed change. I hope you decide not to merge the College of Geosciences, College of Liberal Arts, and College of Science. However, if you do please consider taking into account my few requests because they are not only my requests but the requests of so many of my geoscience peers and would help make the transition a little bit easier for us.

I do not think the College of Liberal Arts should be combined with the College of Science. The two colleges have distinct focuses that are not similar and have different appeals to students. By combining the management of both colleges, the individual personality of each college will be negatively affected. The students in science and the students in liberal arts come with different skillsets. If the desire is to increase the advocacy for the liberal arts program, the college should be kept separate. As an incoming student, there is more appeal in a separate, stand-alone program that shows the school cares about that program. The program can be run by individuals that are passionate and knowledgeable about that particular field of study. Combining these will also create more complexity for students to communicate with the leaders

and decision-makers of their college. I am a student studying Mechanical Engineering and doing research with the Construction Science Department. However, my interests are more similar to that of an Architectural Engineering major. I had an easy process to get my research approved as a technical elective despite being located in a different college. I do not see a need to move the Department of Construction Science to the College of Engineering. In my experience, the College of Engineering is already overwhelmed with class sizes and space, despite having a new building my freshman year. Many advisors are already overwhelmed and not knowledgeable about their assigned majors. The various changes being made to the basic degree programs have also caused confusion. However, the main problem has been the large number of students in the College of Engineering. Increasing the students in engineering will continue to devalue the degree provided by A&M as the quality of students decreases and class size increases. There is already difficulty in connecting with professors due to large class sizes. I have friends in construction science that would never have gone through the requirements of engineering. The students in construction science have no need to go through classes about coding and the ETAM process. The department has a small, close-knit community with close industry connections. Moving construction science to engineering will quite honestly ruin the community and quality of education of the construction science degree, as well continue to increase the complexity already present in the engineering program. As a student who has experienced both engineering and construction science, the department of construction science operates smoothly and offers many advantages due to its sole focus on construction science. Students will no longer feel compelled to join construction science if they are required to go through the difficult processes that engineering requires. Students will be less inclined to choose construction science when there are not strong industry connections.

As a graduate student in the College of Liberal Arts, I am firstly concerned at how few graduate students were consulted for the survey listed in Appendix 1 - 22% of 1775 student respondents comes out to under 400 graduate students, when there are nearly 15,000 graduate students enrolled. This is reflected by this report barely mentioning graduate students, which indicates an alarming lack of concern on the part of those conducting the report for the furtherance and success of graduate students. Secondly, the merger of the College of Liberal Arts with those of Sciences and Geosciences, while potentially a beneficial arrangement, deserves more discussion and thought put into it than an outside report made without the consultation of the vast majority of the constituents affected. Programs in the College of Liberal Arts do not run identically to those in either of the other two colleges and, while the College of Liberal Arts is the second largest college on campus according to student enrollment, it is very commonly treated as a second-class college (and its students, including its graduate students, as second-class citizens). Witness the small percentage of College of Liberal Arts faculty who receive campus-wide acknowledgements of their accomplishments or the much smaller funding granted to the College of Liberal Arts as opposed to smaller colleges. How frequently do Hagler Institute fellows represent the College of Liberal Arts, for instance? I fear that combining the College of Liberal Arts with other colleges will not only result in even further decreased acknowledge of and funding for the members (students, staff, and faculty) of the College of Liberal Arts, but that the departments within the College of Liberal Arts will also suffer from being run differently from programs in the sciences. Graduate student teachers in the College of Liberal Arts, for instance, cannot run multiple classes with hundreds of undergraduate students enrolled every semester, because such courses are taught on the basis of papers and participation, not lab reports and easily-graded scantron tests. My hope is that if such a merger is effected, the very least that Texas A&M can do is ensure that the programs in the College of Liberal Arts are represented in the administration of the new combined college and that the differences in the way our disciplines operate are respected, instead of being forced into a "one size fits all" pattern.

DISCONTENT with Recommendation #1: The Colleges of Liberal Arts, Geosciences, and Sciences should NOT be combined. By combining these colleges, students in these colleges would have a dean that has to view issues in the college holistically, but because it would be a combination of colleges that are so academically different, there is likely to be disparity in how a dean would treat departments that used to be in separate colleges, whether it be because of lack of knowledge or understanding, or because the combination is unnecessarily merging colleges that are extremely different in discipline. DISCONTENT with Recommendation #4: The department of Political Science and International Studies should not merge with the Bush school. There are already programs that allow early entry into the Bush school from these majors (such as the 3+2 program), and graduate school programs should remain largely separate from undergraduate programs. By merging these departments with the Bush school, that would force undergraduate students, who may not have access to easy transportation or may not have the time to transport long distances during the day, to constantly move back and forth between main campus and the Bush school for classes. Also, by merging these departments with the Bush school, the Bush school would lose funds reserved for the graduate program, funds that allow the school to run with the programs it does. By merging undergraduate departments with a graduate school,

there would be a depletion in funds for the Bush school's graduate programs, programs which are arguably need more funds than undergraduate studies.

a. Combining fundamentally different principles into a single college (requiring you to list those members because you cannot group them in a single term "Arts and Sciences") undermines the sense of pride and community of individuals within the previous colleges, likely causing a rejection of the smaller departments brought into a college alongside more historically renowned and substantial programs. From a student perspective this would backfire in terms of advocacy for those smaller departments. b. Similarly, moving departments and programs from homes that provide more substance to the degree from a utilitarian perspective would devalue the degree even if it is felt they may be more related to another. For example, biology and biomedical sciences in a college of science provide a more versatile and understandable degree than one under the name of AgriLife. Students' goals would likely align more with the School of Public Health even. c. Liberal arts seems more at home and related to other arts like visual and performing with their exploration and expression in society, if the goal is to make a new school of visual and performing arts d. I think that the Bush School of Government and Public service should be elevated as it is a highly revered part of the university that could definitely benefit from a closer relationship to the Department of Political Science as well.

This suggestion is a huge move that should require more consideration than a third-party company's few-month report. This is fundamental restructuring of the university and its colleges should be taken lightly. Even this suggestion in its rather abrupt manner has already caused uncertainty among faculty, some of whom have already resigned. In my opinion, the fact that A&M is a public university means that it does not have the privilege to solely focus on metrics and creating "singular focus" colleges and departments at will. It has a responsibility to the state and the public to keep a variety of degrees available. Merging colleges and throwing departments back and forth will cause small programs to get brushed aside and the university as a whole will be worse off because of it. Even if someone has a different opinion, I think that the gravity of this change deserves a public, open, conversation that is not based on a single group's opinion. More study is required at a minimum, and preferably this process should be drawn out over a year or two so that all potential issues can be brought to light and considered appropriately.

Strongly agree with reorganization of Colleges. Combined school College of Arts and Sciences would provide strong opportunities for interdisciplinary collaboration and be able to better support staff and students. Also agree with the elevation of the Bush School and integration of Economics/Political Science/International Studies departments into the Bush School. The existence of both the Bush School and College of Liberal Arts fractures TAMU's expertise

The department of Construction Science needs to stay where it is at. Moving it to the college of engineering will inevitably take away from the incredible teachers that we have and personal affections we hold towards construction science. Also, a lot of people move from engineering to get away from the toxic environment A&M has created through weed out courses in the college of engineering and accepting any breathing soul that wants to be an engineer. That's why we are one of the top construction science programs, but not nearly the top engineering programs.

Don't combine liberal arts and sciences!!! I can understand combining geosciences and sciences, but liberal arts has a completely different focus and electives and courses than sciences. Sciences have a much more technical course load and won't mesh well with liberal arts. Geoscience and science makes sense because they are both sciences.

There is no summary of the realignment as proposed. Specifically, there is no list of departments as they currently stand and where they will be after the realignment. The proposal is vague and has an incorrect accounting of number of departments and degree programs for at least the College of Geosciences, and fails to mention the number of graduate degree programs. Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. - this is vague and later recommends to strip the Biology Department from the College of Science and form an Institute of Biology. There is an expanded list of facilities services in Appendix 3 detailing specific funding for Daily restroom cleaning, Install white board in GA, Install cabinet in department office classroom, Graffiti removal, etc. However, there is no summary of the departments as they are located housed (specific colleges) and where they are planned to be housed in the proposed realignment.

While I like the idea of Recommendation 1 and the creation of a new College of Arts and Sciences, I am concerned about how funding will be allocated. I am an English PhD candidate, and my experience at every institution I have been in, and the others were liberal arts colleges, was to cut the arts or liberal arts courses in favor of the sciences. If there is one college for both arts and sciences, I worry that my programs that I am part of, or programs I will have been in as a student, will be gutted due to budget cuts in favor of the sciences. Additionally, graduate students in the English department already get paid less than graduate students in science departments. That inequality should be balanced

out. I don't think we need a department of journalism on this campus. Journalism can be done by English majors if journalism courses are offered or there is a certificate program for it. I don't think an entire department is needed for that. Additionally, adding journalism pulls students away from the English Department and English degree programs, which could then in turn be used as motivation to get rid of or shrink an English department. Encourage adding a journalism certificate to the English degree instead as opposed to creating a whole new department. I have some issues with Recommendation 9a. It states, "To ensure that each College focuses on its mission and are not distracted with students who do not have the qualifications or interest to enroll in a College degree program, the University Studies program should be unified in the College of Arts and Sciences." Why is that not distracting to the College of Arts and Sciences? Once again, this is my fear that a College of Arts and Sciences becomes the dumping ground for any "problem program" that the University has, and all of us are fighting for funding. I do think it's a really good idea to become a STEAM university as opposed to STEM. That would set the university apart from others. However, my experience has not shown that colleges are serious about promoting the arts, especially when they force them to compete with the sciences for funding.

---

Rationale 9C talks about relocating the Department of Construction Science to the college of Engineering. I do not agree that this is better for the program as the present program is one of the leading programs for Construction Management and it primarily focuses on the management of Construction projects. It is also friendly to architecture and engineering students. Having Construction Engineering and Management under the the College of Engineering is good enough and these both should remain independent of each other.

---

As a Visualization major, I think that the creation of a new college would be wonderful for Viz! We have needed better support and more resources for a very long time, and I think being a foundational pillar of a new college will really help us to take off and continue to do the great things we are known for.

---

My primary comment will be on Recommendation #1 to combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. I understand the pros to this realignment but there are consequences that I am not sure were understood. As a geosciences student, one of the best things about the college is the size. It was one of the many reasons besides the majors offered that I chose the College of Geosciences. The environment this college creates is friendly, kind, and encouraging to anyone. The faculty and staff do everything in their power to help us succeed as students and prepare us for the professional world. On top of this, many organizations and offices now reside in the College of Geosciences. Departments and centers like Texas Sea Grant, the International Ocean Discovery Program, the Center for Atmospheric Chemistry and the Environment, the Center for Technophysics, and the Texas Climatology office are all held here. If we were to combine into one, massive college, I am unsure of what would happen to these centers and departments. To keep this short, this recommendation is not a good idea. Trying to put three very different colleges together could cause a lot of issues within each department in the future. All I ask is that you listen to what the faculty, staff, and students are saying before making your decision. Geoscientists make a large impact in this ever changing world and contribute to many things. Please understand our position on this recommendation.

---

I strongly believe that "Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences" is not going to benefit the students of Texas A&M University. Arts and Science are very different field groups which require personalized advising and separate administration. If there is the need for significant cost savings by combining three administrative college structures into one administrative college structure, I propose combining the College of Science with the College of Geosciences because both colleges have much more in common than either college has with the College of Liberal Arts. If these two colleges were combined into a new all-encompassing TAMU College of Sciences, the new College would have 11 departments, 72 degrees, and 5,445 students. This would result in a five-legged stool structure that preserves the overall specialization of advising and administration. To create a four-legged stool structure, I suggest combining colleges that have similar rather than different field groups. For example, it makes sense to combine the Bush School of Government & Public Service with the College of Liberal Arts into a new all-encompassing Bush School of Government & Public Service because those have many similarities. It also makes sense to combine the School of Public Health with the College of Nursing into a new all-encompassing School of Public Health & Nursing because those also have many similarities. It does not make sense to combine very different colleges with specialized professors and advisors for only either field. Furthermore, there are many students concerned about the reputation of a degree in science from a "College of Arts and Sciences" that combines very different field groups. I asked for the opinion and feedback of my former professor at the community college I attended before transferring to Aggieland about her opinion. As a graduate

of Class of 1992, she is not amused about the possibility of a "College of Arts and Sciences". The comparison with those 19 peer institutions does not validate the recommendation. 12 of 19 peer institutions using this model is not an overwhelming majority (<2/3). The comparison to those distant universities is questionable. The arguably nearest peer institution (University of Georgia) is roughly 900 miles from Aggieland. There are many peer institutions much closer than the universities that are used for comparison. I would like to know whether our rival institution TU, the University of Texas at Austin, has the proposed Liberal Arts and Sciences college structure. We should compare our college structure mostly to peer institutions that are not distant across the country but rather in our home state.

---

The college of liberal arts should be kept separately from college of sciences. The bush school should be absorbed into the sciences college.

---

A lot to say here with not enough space to say it. All of it disagreeing with what has been proposed. Everything in the proposal benefited the liberal arts department and had nothing of benefit to the science and geoscience students. This merger would lessen the specialized geoscience field of study that we are able to have with being a stand alone college. Hate is a strong word and I think it's acceptable to use here when saying many of the geoscience students will absolutely hate this if this merger goes through. Many of these geoscience students were attracted to this college and A&M as a whole specifically because it is a stand alone college at this university. Several current students, along with myself, would not have even attended this university had the college of geoscience not been a stand alone college. By merging the science, geoscience, liberal arts, and parts of architecture and lumping them all into one college you would lessen the quality of the degree of all of the students would eventually earn, insult the STEM based majors, and make many current students unhappy while also losing the interest of many potential students. While having one huge college looks appealing for the University, it is not beneficial nor attractive to current and future students. It feels like the university wants to boast over having big things without actually considering how affective the bigger college would be for the students compared to now, with our current smaller, specialized colleges. The proposal also sounded like it wanted to boost the liberal arts college by riding off the current successes of the science and geoscience colleges. If this happened it would only bring everyone down, not boost liberal arts up. I would also like to point out that A&M is a STEM and research based college, not a liberal arts college. Why sacrifice two very successful examples of STEM and Research for a college that is not of main focus. If this happens myself and several other students have talked about seriously considering leaving the University as a whole. If this is not even slightly concerning, then this just proves to myself and other students that this merger is not in thought about the students, the reason why this university is here in the first place, but only the bragging rights of having a big college. Overall this merger sounds like a bad joke, an insult, and a horrible idea. I would love to write a short paper on what all I found wrong with the proposal. I hope this is helpful in your decision against this merger. Thanks and Gig 'Em

---

I don't see the benefit in combining the college of science and liberal arts besides making a bigger group. Having math and physics majors in the same college as a classics major doesn't make sense. My fear is that the academic advising for degrees like this would decrease in quality due to a lack of knowledge in a contrasting subject.

---

I truly believe that moving the Construction Science program to the Engineering Department will do more harm than good. After discussing with some of my peers, we all believe that the Construction Science program is thriving where it is and should stay. Thank you!

---

Homogenizing the assessment of Arts and Science by creating a combined college may do more damage to the schools of liberal arts that holds different values that cannot be easily quantified. My personal associations with the University Libraries does confirm the excellence of the librarians. Incorporating their expertise with information science could serve as a great bridge between the schools of liberal arts and science.

---

I do not like it and do not think it will be efficient effective or necessary

---

The joining of political science and the Bush school has the potential to affect professors in several ways. If they're asked to take away some classes from their current teaching catalog it will drive them to leave the university. One of my favorite professors is someone that actually helped inspire me to pursue research. I would not have gotten that opportunity without him. I firmly oppose the Bush school taking in political science. I have heard it would lead to many professors leaving.

---

I think that the consolidation of advising would have detrimental effects on the ability of advisors to serve A&M students. It is already very difficult to meet with an advisor due to the large student body, and consolidating these services would exacerbate this issue. Also, advisors need to be equipped with tailored advice to a student's major. Departmentalized advising makes training advisors more feasible and ensures students receive accurate information. I do not support

combining the college of sciences and the college of liberal arts. I also think eliminating the Biomedical Sciences major and/or resolving it's relationship under the college of vet Med would be detrimental. The College of Vet Med facilities serve BIMS undergrads very well. The classrooms and labs excite me about professional school, specifically continuing my education here at A&M.

---

The uniqueness of A&M having a specific college for geosciences is special to many Aggies. I have met countless students who are so passionate about the fact that they are represented with their own school and make that jokes about how it "rocks". My friend reached out to me, asking us to help defend the the college staying separate from the colleges of liberal arts and science, it is people like her that there is passion for geology and for Texas A&M. Shoving their college into a group of others is a slap in the face to the Aggies it applies to, showing them that they aren't important enough. Please consider keeping the colleges separate so that their passion won't die.

---

As a student of the geoscience (meteorology to be specific) I chose TAMU as my first decision because of its outstanding performance for all geoscience students. I was also looking at other nationally known meteorology programs. TAMU has been in the top three schools for geosciences for so many years. If this goes through all geosciences will be watered down and so many opportunities will be taken away from all the students. Not only that but many establishments and businesses will favor a student with degree from a geoscience school verses and student with a meteorology degree that's from an "arts and science". This is taking so much away from so many students that chose this university for the geosciences. Not only that but the size of the geoscience college makes the students, myself included, feel more included and heard. If I were part of a larger college I would feel like I am just another "body" that profs don't care as much.

---

The construction science department which as of now under the College of Architecture, enjoys a certain degree of autonomy in how the curriculum is set and how it is interdisciplinary in it's standing with the Dept of Architecture. The current proposal to move it to the Engineering department poses questions on how this would influence the way the program is structured and the possibility of an unbalanced change the program might start seeing in the future owing to the demographic of faculty that the Engg school has. The faculty at COSci are people who are experienced in "active construction" and not just people who have sat down and done structural design or analysis. This sets apart the program and I am sure the industry commends the curriculum and the influence of the faculty on the students. CoSci students are known to be practical learners and have hands on skills to tackle issues in project planning, management, scheduling, estimation and many advanced project management skills. The move though does not clearly state it's details but the possibility of it becoming a twin of a CEM / Civil program is highly likely. We could lose the national standing we have in terms of what the program is known for. Hence, I believe the CoSc dept under the College of Arch should stay as is and maintain-build further on it's uniqueness.

---

I am a current PhD student at the Department of Political Science and will be possibly affected by a merger with the Bush School of Government and Public Service. If this recommendation is acted upon, I would hope that our department retains our faculty and ability to dictate the Political Science curricula. I would very much miss the opportunity to work with such talented faculty and receive the top-tier training that is offered here. It would also be appropriate to bring along the Economics department if such a merger took place to maintain the academic environment that we currently possess. Thank you.

---

please DO NOT merge these colleges, so many organizations and sub groups within each one will not hold the same significance as they do right now and on top of that this would make texas a&m less unique as we would have more cookie cutter colleges just like other schools. These are complete different fields of study with different organizations that are special to each college. We don't want to lose that

---

There is no reason Liberal arts and sciences should be merged into one college. 1. They are TOTALLY different fields of study and 2. All the independent councils for each college would be indefinitely messed up. Tamu is known for having a college for geosciences so let's keep it that way and have the 2 different colleges for the way different majors that each college provides.

---

please DO NOT merge these colleges, so many organizations and sub groups within each one will not hold the same significance as they do right now and on top of that this would make texas a&m less unique as we would have more cookie cutter colleges just like other schools.

---

I don't believe that the construction science department should move colleges, it would make things confusing and works well under the college of architecture. The construction science department is one of the best in the nation and by moving the department it may cause more issues than fix problems

---

As an Aggie since birth, I have looked forward to graduating with a degree from Texas A&M. These recommendations make me dread the day I receive a diploma from the "College of Arts and Sciences". I cannot express how betrayed I feel by my university right now. By clustering arts and sciences, which throughout all of history have been nearly opposites from each other, it gives the impression that these majors and departments are not important to the university. It comes across like the other colleges were created first, then everything left over was hap-hazardously compiled into "the other one". The purpose behind this is to be more similar to our peer institutions. I am offended by this. Our core values-Respect, Excellence, Leadership, Loyalty, Integrity, and Selfless Service- are what make this university an honorable place to attend and give meaning to the ring we wear on our hand. To restructure our college in order to fit in with other schools tells the student body that our university officials do not care about the excellence of our student body and reputation. It tells us that it is better to conform ourselves to appease others than to do what we know how to do well. This is not the attitude of the university that I grew up believing in.

combining the college of science and liberal arts sounds like one of the worst ideas i've ever heard. they are COMPLETELY different and there is no reason someone who is a Statistics major should be in the same college as a Communications major. that makes no sense and they are good separate and should be kept separate. because they are so different advisors will have to work so hard to learn soooo many different degree plans and processes and will result in worse advising for the students. additionally, i don't agree that biology and biomedical sciences should be shoved together because they are SO different too

This all sounds like a good plan. The university in the last 30 years has evolved in a way where it's core academic areas have become uniquely developed in ways where they have not been able to support one another, and sometimes not even themselves. The report highlights this very well and gives key points on how to fix the issues that are now finally being talked about thanks to the report. It would be extremely beneficial for the university to follow through with these suggestions on how we could make our university better for the future, and more prepared for the inevitable growth in the coming years.

I do not believe the department of construction science should be moved to the school of engineering. What we learn in construction science has its similarities to some engineering field's, but we learn to be builders and how to build a project from the ground up. Engineers/architects are the ones who design these buildings, we (construction science students) plan, procure, and execute these projects.

I am a BIMS PhD student (I also did my UG here in BIMS with a double major in psych). I am so thankful for my time within the CVM and I LOVE the community provided. As an undergraduate, I appreciated the close contact with the vet school, and worry that this camaraderie would be greatly hampered if the BIMS program was moved out of the CVM. If you DO choose to move the BIMS program outside, I think applicants would appreciate the prestige of being housed under the College of Medicine, rather than Bio/Life sciences. A downside of moving the BIMS program out of the vet school is the loss of connection with veterinary professors and research. As a graduate student, I can personally attest to the great benefit of the resources to animal research afforded to me because of my affiliation with the vet school. I believe this would be lost if the BIMS program was removed. Additionally, where would the teaching load of CVM faculty go? I hope to teach physiology to BIMS undergrads as they prepare to launch into med school, vet school, and PA school. I can see where the MGT people are coming from -- cutting down on overlapping admins -- but I feel removing the BIMS from the vet school would be a disservice to our students and faculty. My BIMS education (both undergraduate and graduate) have been greatly enriched by the close ties with the vet school. Thank you for hearing my thoughts!

Simply put, academic realignment is unnecessary and is bound to create conflict and confusion among former, current, and prospective students. More specifically, the realignment and formation of the "College of Arts and Sciences" is unnecessary and unrealistic. As a current student of the College of Geosciences, I enjoy being a part of a smaller college, as there are many benefits. From the relationships I have and will continue to grow with professors and fellow Aggies, to the ease of advising and advising appointments with a RECURRING advisor. The combination of the many different colleges and majors, in the "College of Arts and Sciences" will be more of a con than a pro, in my opinion. Personally, I enjoy being able to say I am a part of the College of Geosciences, and I can assure that my peers feel the same way. It's simple to understand exactly what I am studying, but the "College of Arts and Sciences" will confuse many people and also seems to delegitimize specific colleges and majors. I would expect that to be the last thing Texas A&M, a world-class University, to do. To add, I have personally began looking to transfer if this does proceed forward. As I am sure many people may be considering as well. Thank you.

The colleges should remain separate because even though there is some overlap between classes many of the proposed integrations are not significantly alike.

I am not fully opposed to combining Arts & Sciences, but I know more transparency is needed or the University might face a mass walkout of faculty and staff unhappy with the way their service to the University is being treated. I am not against enhancing a performing arts space, but the University already has performance space that are being underutilized. Why can't the performance arts program use existing performance structures on campus? Or even rent more public spaces out (Wolf Pen Creek?)? There is also a robust community theatre presence that could benefit from being allied with the Performance Studies academic program.

None, agree with the MTG Report.

While I value the process of soliciting and receiving outside constructive feedback, omitting graduate student voices in the body of knowledge MGT amassed to make their recommendations is a glaring omission. As significant contributors among the student body, we deserve adequate representation. I speak as an English PhD. student. In the humanities, GATS function more as junior faculty than the lab assistants found in the STEM fields. We control large portions of our course content and implementation. As a result, we influence several critical metrics important to the university's mission. For example, all our department's graduate students will teach ENG 104 and ENG 210, directly reaching the university's largest population of first-generation students. We do so earning a low pay scale that directly inhibits recruiting the best graduate students available, hampering the inclusive excellence that could further diversify our departments. I will keep my comments to these brief concerns, but I would have welcomed the opportunity to speak further on how we as humanities GAT's contribute to the university's success in these key roles. Therefore, I have issue not with the findings of MGT, but in how they were solicited. Our English department is flourishing by all metrics and inhabits a unique realm that requires careful thought before merging into a college of Arts and Sciences. If that is ultimately what happens, I will embrace it, but I urge for more input from those whose voices were overlooked because we contribute too. Findings may have been different had we been consulted.

Texas A&M administration is taking for granted the strength of its world-renowned geosciences program. I am going to specifically reference examples of the department of oceanography and the department of atmospheric sciences because I am most familiar with them, but this reputation applies to other departments as well. Texas A&M college of geosciences is the current science operator of the International Ocean Discovery Program (IODP). We have been the science operator of this program for nearly 40 years. IODP is a project that manages the ship JOIDES resolution, a drillship that can collect core samples of the seabed from nearly anywhere on earth. IODP also has a building on campus that houses ocean core samples that are as old as 1968. By dissolving the college of geosciences, we risk the National Science Foundation completely pulling out of Texas A&M when the project is up for re-evaluation in 2024. The college is also one of the founding members of the University Corporation for Atmospheric Research (UCAR). UCAR provides the college with a Unidata LDM, an ultrafast internet link to practically any atmospheric observational data or model output that any student or faculty researcher could ever want. By dissolving the college of geosciences, we risk losing this access. TAMU's meteorology program is frequently ranked in the top 3 meteorology schools in the nation. The other two schools are PennState University and the University of Oklahoma. PennState has a distinct college of geosciences that houses their meteorology major, while OU has an entire college dedicated to just meteorology. The report suggests a "four-legged stool" design of Engineering, Ag, Health, and Arts and sciences. It's clear that of the four colleges, "Arts and Sciences" is designed to act as a "junk drawer" for majors that cannot immediately be disposed of, but also don't fit in the other three "legs" of the stool. This is a slap in the face to the reputation of the atmospheric sciences department, which many of the faculty have spent their lifetimes to gain. Meteorology is modeling of three-dimensional vector calculus. It makes no sense to me that we would be placed in the same college as English majors. Of the 120 hours needed to graduate with a degree in meteorology, 66 of those hours also apply towards engineering degrees. I think it's a mistake to get rid of the college of geosciences, but I also know that the president has received a large amount of money with the sole purpose of getting rid of the college to keep her donors happy. I see this as corrupt, but if the college is going to be dissolved anyway, I suggest that the atmospheric sciences department be realigned into the college of engineering instead of the college of arts and sciences. We are more similar to engineers than we are to artists.

As a student in the College of Geosciences, I do not think alignment with Liberal Arts will provide any benefits and think the College Of Geosciences should be left to stand alone. Students in Environmental Programs want to receive a Bachelor of Science, not a Bachelor of Arts. The college of "Liberal Arts and Sciences" makes it seem like all of the small

colleges were just grouped together when they have nothing in common at all. Texas A&M is a huge university that is known nation wide, I personally do not know why we are trying to follow in smaller colleges footsteps with these changes. Students in the geosciences are very satisfied with our small community and our own personal identity on campus; it was one of the reasons I decided to pursue an environmental degree at A&M. In an attempt to increase the arts, you very well could be diminishing the environmental programs here at Texas A&M which would be a big shame to future environmentalists. I implore you to keep the students in the College of Geosciences in mind when you make this decision. We do not care we are a small college. We would like it to stay that way. The College of Geosciences is nothing like anything else offered here at Texas A&M. It should not be placed into a group of Liberal Arts majors just because it is small. It does not make any sense, nor will it improve anything within the College of Geosciences. If anything I see this change having negative benefits in the community and counseling aspect. Thank you for taking the time to read.

---

The academic realignment strategy seems lacking and unproductive in some respects. For example, the new "four-legged" stool structure ignores both the business and architecture schools all together. The engineering school should not hold degrees that are outside of engineering. This will ensure the engineering school holds its prestige and can focus solely on engineering. With this being said the Construction Science Department should stay within the architecture school. This is part of the built environment.

---

-make tamu have 5 pillars instead of 4 -have their be a dedicated arts school and a dedicated sciences school because there are way too many students for one designated dean to worry about -just because the "better" schools have a combined arts and sciences school doesn't mean it'll work for us and our large student population -arts & humanities should be a separate school and should be allowed to grow on campus and have a bigger part -aside from that all other planned changes are cool

---

It would be best in the best interest of the university to let the Department of Construction Science remain in the College of Architecture. I do understand that there is a relationship with Civil and Mechanical Engineering as highlighted in the report. I also recognize that the College of Engineering at Texas A&M is also world class. However, as also stated in the report, the Department of Construction Science is already nationally recognized as one of the top programs in the country, and a lot of this is due to how the program is currently structured and the wonderful faculty we have within the program. I can speak from personal experience, the Department of Construction Science has provided me with a great education, landed me an internship, and has truly made me feel that I will be ready to enter the industry as soon as I graduate. Texas A&M is known to hold on to our brilliant traditions, and this is an area where there is no need to break tradition. With the great success of the program, there is no need to make any adjustments, and no need to move to the College of Engineering. This is justified by observing the large amount of support we have from alumni, current students and faculty, and all of our CIAC members. Not to mention the marvelous career fair we hold each semester, and most importantly, the classes we attend everyday. I am always so proud of how well recognized and respected we are, and am honored to tell people I am a Texas A&M Construction Science student, rather it be on a jobsite or just striking up a conversation with someone. Both Texas A&M and the Department of Construction Science are both well respected and synonymous with excellence, and it is imperative we continue to uphold these values by continuing our current operations and organization.

---

I am giving my feedback for Recommendation #1. I do not think it would be wise to combine the College of Liberal Arts, College of Science, and College of Geosciences into one college. Focusing on rational 1, as a geoscience student, this point seems to favor the liberal arts. Throughout this recommendation, the size of the college is emphasized often. The reason I choose the College of Geosciences at Texas A&M was because of it's size as it is now. I want to emphasize that I think the College of Geosciences and College of Liberal Arts should not be combined because, as students, we are so different. My sister is in the College of Liberal Arts and we think so much differently. I even think reducing the administrative structures to one would be a disadvantage or an incredibly hard job for whoever is put in that role. They would have to juggle so many different niches, from the oil and gas industry, international diplomacy, to the medical industry. This may be hard for companies to recruit from as well.

---

I believe that the consolidation of the college of liberal arts, science, and geoscience is a way to pander to liberal arts and weaken the strengths of the college of science. It is understandable that the university wishes to become more well rounded. To do this they should focus on implementing successful strategies specific to colleges like that of liberal arts. The overall restructuring feels pointless and an unnecessary way to cause mayhem in the university.

---

Sport Management is under HLKN. Getting moved to the school of public health/ Kinesiology moving into a health department would leave sport management stranded without a department. On top of it all, even if SPMT stayed under HLKN if it was moved out of Education and Human Development, tuition rates would increase exponentially. I am

interested in getting my masters of sport management here at Texas A&M, but if SPMT gets moved, I will be looking at other options for post-undergraduate education.

---

I chose to attend A&M because it was one of the few schools that had Performance Studies as an undergraduate major. If a School of Visual and Performing Arts is established, it would be a great asset to continue to offer a BA in Performance Studies due to the fantastic faculty and staff that are one of the major reasons I have stayed at the school through the pandemic. They have been nothing but supportive and pushed me to be the best artist/scholar I can be. The School of Visual and Performing Arts would be made more complete by keeping the academic research element alive via Performance Studies. I agree with the report that creating, collaborating on, and learning about art is an important element of becoming a leader. Theatre, music, dance, visual art, and research should all happen alongside one another, where the most effective collaborations can occur.

---

I support the idea of creating a new Institute of Biological Life Sciences as housing the biological life sciences under one institute will allow for greater collaboration between them due to the many overlaps between the biological life sciences. However, I am skeptical of the idea of moving them into the College of Agriculture and Life Sciences and AgriLife. If anything, I would support the creation of the institute under the College of Science. As a student in the College of Agriculture and Life Science majoring in biochemistry, the resources provided to us in the College of Agriculture and Life Sciences are more geared to agriculture rather than scientific research which many of us wish to pursue as a career. For instance, sometimes I feel out of place in my Hullabaloo U Course run through the College of Agriculture and Life Sciences. Most of my classmate want to go into agriculture focused careers, so naturally, the class orients itself more to that perspective leaving those of us wanting to enter research outside of agriculture feeling "left out." I can image that the College of Science has much more appropriate resources for biochemists than the College of Agriculture of Life Sciences does. Similarly, I apply this same line of thinking to the biological sciences. Placing all the biological sciences into the College of Agriculture and Life Sciences can cut off their students from the plethora of resources provided to them in the College of Science as, like mentioned previously, the College of Agriculture and Life Sciences has resources more orientated towards agriculture. While I understand that a rationale for bringing the biological sciences into the College of Agriculture and Life Sciences is to "allow for easier collaboration for the biologically oriented faculty in the College of Agriculture and Life Sciences to collaborate with faculty throughout the university working toward similar interests," this can already be done with the biological sciences being housed in the College of Science where the College's student resources will not be sacrificed for those students. Finally, I also believe it would be beneficial to move the Department of Biochemistry and Biophysics into the new institute as there exists sufficient overlap between the Department of Biochemistry and Biophysics and the other departments proposed to be moved into the institute.

---

Please keep the BIMS degree under the college of veterinary medicine. I love being a BIMS student, and I really like the BIMS directed electives. BIMS electives are very geared towards prehealth students, so the classes are really interesting and applicable. If BIMS moves to a different college, many pre-vet and pre-med students will be confused. Additionally, please keep the department of biology under the college of science. Biology classes are super important and moving them to the college of life sciences and agriculture will prepare students less for the tougher upper-level sciences.

---

Do not combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. That is the most ridiculous thing I have heard in a while. Especially combining liberal arts with the others. At least science and geosciences are very related. Liberal arts and science is possibly the most unrelated colleges and they recommend we combine them? That make absolutely no sense. They are different colleges for a reason, and it should stay that way. It might be more efficient for the store to combine all the fruits into one giant pile but nobody is going to do that for obvious reasons. The same logic applies to this. They are different colleges studying completely different things. Do not combine them.

---

I and a lot of other students in the college of Geosciences do NOT want to combine our college with the college of liberal arts. It is not related to science whatsoever, so it does not make sense to combine any college of science with them. I am frankly very offended that this is even being considered. Being grouped with a college of art degrades the level of difficulty of my degree and I do not agree with this proposition.

---

My input is mostly regarding rationale #2, recommendation #9a, and #9c.; although, I may mention others. As a University Studies Architecture (USAR) major this is concerning to me. My experience within my major has allowed me to make my degree plan more specialized while still being fully immersed in the welcoming culture of the College of Architecture. The College of Architecture is unique because the students collaborate between majors which is important when working on creative projects because our diversified perspectives allow the project to flourish in ways that would

not be possible without collaboration. If the College of Architecture was broken down and separated, leaving only ENDS, Landscape Arch., and Urban Planning this diversification would be lost. As a USAR student, I value the connections I have made within the College of Architecture. Construction Science majors have voiced their opinion that within internships they do not connect with engineers. Instead, they connect with the architect. Visualization majors are valued for their wonderful creative abilities and the joy and insight their ideas bring to our college (COA). I know the idea is to elevate the College of Architecture, and I am excited to see that the University is attempting to make this happen, but I am worried that this is not the best way to do it. It is also amazing to see A&M wanting a College of Visual and Performing Arts. I think the university would benefit greatly from this advancement. I propose that instead of breaking down the College of Architecture to elevate it, we expand it. Bring what would be the new College of Visual and Performing Arts to the College of Architecture. Build the COA more space to allow Visualization, ENDS, and the other majors to grow. The student body of the COA would be overwhelmingly happy to welcome more creative minds into the wonderful community that we have created.

As a student who changed their major to construction science from engineering, I personally do not advise A&M to follow through with this merge. I, as well as other former engineering majors, mutually agree that the way professors deliver courses in the COSC department is far different than in the engineering school. Firsthand, I have experienced the willingness and compassion from professors in the COSC department that I never found in engineering. My first year here, I was only another student in the engineering school. In construction science, I found a family, where everyone is willing to help me, rather than being more concerned about their own research. Furthermore, the content is somewhat similar to architectural/civil engineering but would be a mistake to merge these precisely because of the facts that COSC majors interact more with the architects hand in hand. I have friends in both departments, and the architecture major's knowledge and grasp of the material is closely related to mine more than the civil engineer. With this in mind, I hope officials realize how this merge would negatively impact the students, not only academically but also in their relationships with their professors.

Please consider stop making super colleges where everything is combined under one name. Funding and space are becoming increasingly sparse within engineering and it is hard to oversee so many students on an individual basis.

None

As a Student Senator of the College of Liberal Arts, I ask for these changes to the suggestions: Please keep the Journalism degree in Communication, immediately rebrand the Communication department to Communication & Journalism, rename the degree Journalism and Media Studies (B.A and B.S. and 3+2 Masters), while working towards a future School of Communication & Journalism.

I am concerned with the concept put forth in the report regarding the merger of the Bush School and the Department of Political Science. I fear that this merger would completely irradicate the culture of the Bush School and supersede the intention of its programs as envisioned by George HW Bush. The report seems to imply that there is overlap between the political science department and Bush School programs, and I would point out that this is a gross oversimplification of both programs. Political science focuses entirely on social science and the graduate programs prepare students for academia. The Bush School prepares students for lives of public service and educates them in international security and policymaking at the practical level, not theoretical. Having been a student of both the department of political science and the Bush School, I firmly believe that joining the two schools would ruin both programs. Further, we would likely lose a large number of Bush School faculty members, especially the practitioners who provide valuable insight and instruction from their incredible real-world experiences. The picture painted by this report is clearly from an outsider's perspective who does not understand the intricacies of both programs and feels that simply because they're both somewhat related to government and politics, that they are interchangeable. Force-fitting the department of political science into the Bush School would ruin George HW Bush's living legacy because the school would no longer be about public service, we would lose practitioners with incredible professional backgrounds who come to teach at the Bush School because it is not academia focused, and our remarkably high percentage of students who go onto public service would drop drastically. This merger would be a mistake that neither the Bush School or the Department of Political Science supports, and I would hate to see future Bush School students receive a subpar experience because of it.

I believe that the Department of Construction Science should stay in the College of Architecture in respect to field operations. In field operations COSC majors communicate more with architects than engineers. Furthermore the department of Construction Science is based on the management practices that go along with construction rather than the designing process.

I support recommendation #4, which discusses elevating the Bush School. If their programs were more accessible to undergraduates, many would be interested.

---

I do NOT think it's a good idea to combine the college of science into the college of arts. It's disrespectful that instead of trying to provide more resources to the individual colleges, the easy way is being taken out by just throwing together all the colleges that don't seem to get much attention, further pushing them into the corner of "we don't really care about you." As a chemistry major, the last thing I want on my degree is the "College of ARTS and science." It feels like it's diminishing my accomplishments and all the nights I spent crying and stressing over my classes for the "science" to be an afterthought. I did not choose A&M for my chemistry degree to come from the same section as an English degree. We will be ostracized for 'picking' a school where our degree is from the "college of ARTS." Students will be less encouraged to join the science and geosciences majors if it's thrown in with the humanities. The college realignment is possibly the worst idea out of the whole MGT report. You are expressing to the students that you do not care about putting in the effort to foster a better education experience in the individual colleges, and instead want to combine them so you have to spend fewer resources on them. Seriously reconsider this suggestion as I believe it will severely affect the future of your science and geosciences majors.

---

Construction Science faculty must remain in their positions. They are great professors and deserve to continue to teach our excellent program. Keep the College of Architecture, as its students have many different needs than the Engineering students. The College of Science is one of the best colleges we have on campus. By combining it with the College of Arts, the needs of the students and faculty could not be adequately met, since Art and hard sciences are very different from each other. The research is different, the classes are different, the students are different. Science and Art are both very important, but not in the same way. Therefore, science and art should not be combined into one college and under one leadership, since the two fields are too distinct from each other.

---

The single largest thing I disagree with in this report is the creation of the College of Arts and Sciences. Unless students' degree plans are able to grandfather in and allow them to stay on their current track without disruption from this change, then it will disrupt too many juniors and seniors.

---

More emphasis need to be placed on engineering and agriculture since A&M is a mechanical and agricultural school not fine arts. There are plenty of other universities to get a fine arts degree from, A&M needs to keep its focus on engineering, science and agriculture.

---

I believe that taking away the College of Geosciences will significantly hinder my academic experience. I am a GIST major who loves the small atmosphere of the College of Geosciences. I have a relationship with several professors and faculty and am an active member of the Student Geosciences Council. I believe that if we lose our status as an individual college, we will not receive the levels of funding and support because we are much smaller in size than the Colleges of Liberal Arts and Sciences. I am grateful for the chance to attend such a great institution but I feel like things are better the way they are right now. I hope that student voice is considered because I feel like there is some relatively strong opposition in the College of Geosciences. I don't want to lose my home within a home here at Texas A&M. It has really made being part of such a large institution more manageable for me. Thanks.

---

The college of Liberal Arts is in desperate need of more investment in faculty and research, as evidenced by its inability to create enough basic classes (e.g. Spanish 101, etc.) for students who need them. A college of arts would fill a huge hole in Texas A&M's academic offerings. My sister, a National Merit Scholar, was unable to consider or take advantage of TAMU because it did not offer her desired degree in Music Education.

---

This comment refers to the proposed merger of the Political Science Department with Bush School. While it is understandable to try to recruit more paying graduate students (for the Master's in Public Administration Program at Bush School) through integration of the Political Science Department, I believe this can be achieved through other initiatives and the proposed organizational changes are not the best way to achieve this. We have a very highly ranked Political Science Department which needs to be protected. Please refrain from doing anything that would damage the department.

---

I am a TCMG student and I would love to see my program moved to engineering! I feel like we are out of place where we are at.

---

The move to combine the College of Liberal Arts with the College of Science and College of Geosciences focuses on the improvements to the College of Liberal Arts while ignoring potential negative impacts on the Sciences. While there are some majors that do overlap both fields (psychology, economics, anthropology), the majority of students in the college of sciences have very different academic paths in college and very different post-graduation plans. The support they

need is different, and it makes sense for them to have different colleges reflecting that.

---

i think that the colleges should stay separate, it is the unique identity and independence of each college that makes tamu great and our experience as students different than at other large universities

---

When it comes to creating the College of Arts and Sciences, the negative I see is that it may become too big and the cultures that exist in the different colleges now may go away. There's a certain camaraderie amongst the people in the different colleges, as there are a good number of shared experiences/courses that people can bond over, as well as similar interests in general, and I fear that lumping everyone together in one big college might make it harder for those bonds to form. The positive I see is for people like myself, who may have been interested in majoring in something in one of the colleges, only to discover that they would like to make the switch to a different one would find it easier to do so if this merger were to happen, as they wouldn't have to change colleges, just departments. I think a journalism department would present a lot of interesting opportunities for students, and agree that the Bush School should be more visible/better integrated. As of now, it feels very distant, and not just because it's on West Campus.

---

1) I support the creation of a new school or department for visual arts. The formation of a new school can and will help elevate the arts, which are an important cornerstone for a society. It deserves as much focus as government, engineering, or public health. 2) I also support the shift to move programs not related to architecture and urban planning out of the school. This will help streamline our programs and help tailor the additional resources to the overlapping needs of the aforementioned group. 3) I do NOT support the consolidation of university studies. After speaking to multiple students that are in the university studies program, they have all voiced their concerns. They feel that what makes the university studies program unique is the access to the college's courses, resources, and academic advisor. Their major concern is losing access to these resources if the university studies is moved outside of the college of architecture.

---

Currently, the College of Architecture being under the category of a science and allowing them to get a BS is much more beneficial to them as a way to get hired after college, as getting a BS shows that they are more knowledgeable in their field and can do more than strictly what their major entails. It would not be beneficial for them to be considered arts students because a BA is less useful in the industry than a BS is.

---

The combination of the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences may not prove to be as beneficial as some of the other recommendations as it may shaft some departments within each, for example, psychology. Psychology is a smaller department here at TAMU but it is of immense value. Decreasing funding towards this department could affect the future of these programs.

---

Students on campus have widely been AGAINST combining the College of Liberal Arts, College of Sciences, and College of Geosciences. This measure does not seem like it would give Liberal Arts majors an advantage, like mentioned in the MGT report feedback. It just further implies that Texas A&M prefers to only focus on those in the College of Engineering or Mays Business School.

---

I do not believe that it is a good idea to merge the College of Liberal Arts, College of Sciences, and College of Geosciences. I have many friends in the Geosciences and they all love the fact that they are the smallest college on campus because it has allowed them to have a close-knit community and strong relationships with their faculty, advisors, and administrators. The rationales listed in the MGT report focus on how this merger would benefit the liberal arts, but nothing is mentioned as to how the merger benefits the sciences. I agree that the arts deserve a greater focus at A&M, but I don't think this merger is the way to do it because it takes away from the sciences. I understand the desire to decrease the size of administration, but a compromise might be to create a College of Arts and a separate College of Sciences that merges the geosciences with the other sciences.

---

I am against the idea of merging science, liberal arts, and geoscience. I take pride in Texas A&M's uniqueness; it is what makes us the best university in the world. Merging the colleges because our peer universities already have is a weak rationale. A&M should be proud of its focus on STEM. I would support an expansion of the Bush School. It is an honor to have been chosen as the home of the Bush library and it would be even more beneficial if undergrad majors were offered. A merging of the Bush school and political science majors makes sense.

---

25 by 25 engineering plan will decrease the value of an Aggie engineering degree while decreasing the quality of education. Few engineering professors are worried about being good teachers, most of them are just worried about their research.

---

Merging the Department of Political Science and the Bush School would be a perfect fit. The change would potentially allow the department to expand its resources, ultimately helping students in enjoying a successful career. An

undergraduate program in the Bush School would also likely help increase the popularity of the school as it currently only serves graduate students. Political Science may become a more attractive major being apart of a school of government with graduate programs in public policy.

---

let university studies remain in the colleges that they are in. This is what makes the university studies major unique, it gives students the opportunity to educate themselves on the aspects of various details but also keeps the focus on a specific college.

---

I believe the push for emphasizing art and sciences (STEAM) is a fantastic idea, though it should not be approached by realigning some departments. For example, moving construction science to the college of engineering would further divide art and science fields rather than unify them. The college of architecture is a perfect example of the unification of arts and science. Removing visualization would allow for less flexibility for architect majors who find themselves leaning towards the design and visualization aspect of architecture. Those who are better strong suited in the science aspect of architecture have the flexibility of learning construction science within the college. Separating the departments from the college of architecture removes that flexibility.

---

I have very mixed feelings about merging the College of Liberal Arts, College of Science, and College of Geosciences. While merging the College of Science and College of Geosciences into a single college makes very logical sense to me, the additional merging with the College of Liberal Arts gives me pause. I feel as though this would further separate the departments within the College of Science from the departments in the College of Engineering, and the departments within the College of Science have significantly more in common with the departments within the College of Engineering than the departments within the College of Liberal Arts. I fully support requiring undergraduate students majoring in the natural sciences take humanities and social science classes and vice versa, especially as I attended a liberal arts college for my undergraduate degree, but I do not believe merging the Colleges is required for this to be the case. I worry that merging the College of Liberal Arts and College of Science may negatively impact the graduate programs currently offered by departments in the College of Science as these graduate programs are structured quite differently than those offered by the departments within the College of Liberal Arts. As a small aside, I do find that the current naming convention of these Colleges is quite confusing. Historically, the liberal arts quite specifically include both math and science, so having a College which consists primarily of humanities and social science be named the College of Liberal Arts seems like an incorrect categorization. However, this naming issue is really beside the point. Simply put, I do not see why the engineering and technology branches of STEM have been placed in a separate College than the science and mathematics branches of stem, or why it would make more sense to place the science and mathematics branches in a College with the humanities and social sciences. I highly support the creation of a School of Visual and Performing Arts. I believe the Fine Arts are incredibly important, and bolstering the Fine Arts programs here would benefit all of the student body. Strong Fine Arts programs offer cultural assets to the community through their performances and art installations which help to make the students who attend more well-rounded individuals.

---

I am concerned about combining the College of Liberal Arts, College of Science, and the College of Geosciences. The rationale of "most of its peer institutions: 12 of 19 peer institutions use this model" seems flawed. Simply because it is the more popular model does not mean it is the best. Is there any concrete data that shows the students are directly benefitted under this model than our current model? If so, the report doesn't say. It only highlights any potential; savings for reducing administration costs. By combining the colleges, it becomes more likely that specialized interests/degrees/majors might be lost amid the large pool of available degrees. By combining liberal arts into other scientifically oriented colleges, I fear that faculty, staff and students might be hamstrung by losing administrative focus.

---

The restructuring of colleges within the TAMU system is an absurd idea. If you want to give the college of liberal arts more focus, combining them with another college is not the answer. Most people who attend Texas A&M are aware of the small nature that their school offers, and if you want to grow our liberal arts program, we should focus more attention on expanding the programs already existing within the college.

---

I do not support Recommendation #5: Create the new Institute of Biological Life Sciences which will contain the Department of Biology and the Biomedical Sciences Program. As a BIMS major, it is already difficult enough to get into our classes (most of us have to force request into our classes every single semester) and it is nearly impossible to see an advisor. Furthermore, if we are able to see an advisor, they are often wrong or ill-informed and combining colleges would only exacerbate the problem, given that BIMS has 2 degree plans currently (Fall 2018-Prior and the current one) and advisors are still unable to give appropriate advice. Combining colleges would also eliminate the benefit of being a BIMS major over being a Biology major, for example. BIMS is designed to help students focus on a pre-professional tract whereas biology is more generalized and meant for students to gain knowledge in a particular field. Finally, the fact that

we are required every semester to submit force requests for classes because there are not enough seats is disrespectful, the opposite of the Aggie Core Values. Proper respect of student time and money would be to have enough professors, sections, and space to host the classes needed for graduation. The University has the capability to know if X amount of students are enrolled in Organic Chemistry II, then Y% of them will move onto Biochemistry I, meaning we need Z number of seats in Biochemistry I the following semester. It is ridiculous that the estimations are off every semester and by combining colleges and therefore force requests, I can only see this problem becoming greater. I have also discussed this recommendation with my fellow classmates and have yet to find anyone who thinks there would be any benefit in combining the colleges. One of the main reasons I chose A&M was because of the uniqueness and purposefulness I saw in the BIMS program.

I am concerned that combining the Colleges of Liberal Arts, Science, and Geoscience is not in the best interest of these students, but for the sake of furthering the STEM-focus of this university. Lumping these colleges into one undermines the distinctness of these areas of study. Liberal Arts and Science are far from similar. Trying to merge them into one large college with little common interest will cause confusion and inefficiency for both students and faculty. The students in the College of Engineering face many challenges due to the large size of the college. These students lack the relationships with their academic advisors and professors that students in the smaller colleges get to have. Creating a College of Arts and Sciences would take away the small college feeling that these students are grateful to have.

Really like the idea of relocating the undergraduate BIMS program to a centralized Biological Sciences department, at least from a student perspective. The CVMBS could once again be just the College of Veterinary Medicine, with focus on post-graduate/professional degrees/research. I'm not sure how it would affect faculty, however. I guess any that taught undergraduate courses and professional courses would now have dual appointments between AgriLife and CVM?

Do not combine college of liberal arts, science, and geo science. There is a reason they are separate.

don't know enough to have an opinion plus I'm in the College of Engineering which would not be impacted much

I do not believe the college of liberal arts and the college of science (or the college engineering) should be combined. This decreases funding and negatively impacts students degree prestige and funding.

As a business student, I am concerned where the school would be located under the realignment. I think consolidating it to be in another school will impact the quality of the academics and the support students currently receive.

Fine with LA being combined with sciences, but the budget of the LA program needs to increase from where it is now.

The more I think about it, the more I do like combining the College of Science with the College of Liberal arts. The report is correct in the need to increase the renown of A&M's liberal arts programs at a STEM-focused school. Reducing administrative overhead is also generally a very good thing. Merging the libraries with this new College could also prove very fruitful.

I completely disagree with the recommendation to combine the College of Liberal Arts, the College of Science, and the College of Geosciences. I am a Molecular and Cell Biology Major in the College of Science and I see absolutely no reason why combining Science with Liberals arts makes any sense. Students of the College of Science have a completely different career path than those in the College of Liberal Arts; the majority of my peers are aiming to enter pre-med or, like me, go into scientific research. I could accept adding Geosciences to the College of Science as they both contain similar coursework (my brother is majoring in Geosciences), but Liberals Arts has no place taking away from the hard work and intense study that my classmates and I put into our education in science and technology.

I am harshly opposed to the Recommendation #9d portion stating: Consolidate the Department of Health and Kinesiology in the School of Public Health, including clinical research associated with the Department of Health and Kinesiology. I am a public health student and this is simple not how the School of Public Health is ran. The structure of the SPH is to allow students to be an undergraduate student with exposure to the five core disciplines of public health. From there, students determine which core discipline they would like to pursue for their Master of Public Health or for their Master of Science program. Thus, the undergraduate student in public health belongs only to the Public Health Studies department, and no other of the other Public Health departments host undergraduate students for their BSPH degree. The other departments (Health Promotion and Community Health Sciences, Health Policy and Management, Epidemiology & Biostatistics, and Environmental & Occupational Health) only host MPH, Ph.D., or DrPH students. If the Department of Health Promotion and Community Health Sciences is taken to add in HLTH and KINE undergraduate, Master, and Ph.D. students, it would throw off the purposeful structure of the School of Public Health. Moreover, it

would make funding for Public Health, Health Studies, and Kinesiology extremely competitive. As per the SPH website, faculty received about \$12 million in research grants in 2020; per the Department of Health and Kinesiology received approximately \$3.2 million in funding in the same time frame. Another massive point that compounds all of this is the size of the Health and KINE department as the largest academic department, hosting all KINE 1-hour courses and other major specific courses for their departmental students. This would cause an enormous need for human resources restructuring within the Department of Health Promotion and Community Health Studies. The purpose of the HPCHS department focuses on external and national public health improvement, while the Health and KINE department takes a physical and clinical health approach. I have talked to faculty, staff, and students from the SPH who feel this is a mechanism to stifle the voices of the Health Science Center and the SPH. We would have an enormous amount of changes to make and given our department sizes being small for a purpose, it would overthrow the balances given to the SPH departments in their foundational nature. Finally, the department of Health Promotion and Community Health Promotion does not conduct any clinical work specifically whereas the Department of Health and KINE could not exist without it. The former takes a population and community based approach that contrasts the needs and purposes of the latter department. This recommendation is not what the SPH would need to better our departments, students, faculty, or staff.

---

Although merging the college of liberal arts and the college of science would encourage attendance of liberal arts majors at a STEM university, I believe that some in the college of science will feel as if their degree is less “scientific”. Some might think that by encouraging liberal arts majors to attend, it detracts from their STEM based degree as they’re now lumped together.

---

Please don't do the plan. It's not a good plan. We don't like the plan.

---

As a student not affected by this move, I think it is incredibly important for me to speak out and stand up for the students who are being affected by the realignment and echo their dissatisfaction with it. First and foremost, Texas A&M is an university built on its uniqueness. That is one of the main appeals for students like myself to come to this wonderful campus and enjoy the life of an Aggie. It seems almost against the very premise of our culture to simply “do what they’re doing” and match other programs combinations and realignments. Secondly, I believe that this alignment would do the exact opposite of its intent of drawing more students into both schools. Personally, and following the opinions of many other individuals as well, I would much more likely move to a school dedicated to my desired field of study, like a dedicated school of science. Mushing these different programs together would be a huge turn off for me, as well as many individuals I’ve spoken to, when considering what school we’d wish to join. At the end of the day, I know I don’t have the knowledge of a management firm and I certainly don’t think that I know best. However, I am an Aggie through and through and I am proud of that. Our university prides itself on its uniqueness, so let’s keep that spirit loud and proud!

---

After reviewing the report submitted by MGT about the realignment of colleges within the university, I feel strongly opposed to said changes. Combining arts and sciences is overall regarded as a terrible decision within the student body population, as this devalues our individual colleges, makes getting a spot in our classes during registration even more difficult than before, makes advising even worse than it already is, and has the potential to turn away future students from the university. I know that I speak on behalf of many of the students at Texas A&M when I say that if this realignment had already been a thing when I was deciding on where to go for college, that would have turned me away from choosing Texas A&M. So to reiterate, I and most all other students at Texas A&M, are strongly opposed to these changes, and recommend leaving things as they were. Thank you for your time and consideration.

---

Don’t combine the College of Liberal Arts, College of Science, and College of Geoscience. The arts and the sciences are on opposite ends of the spectrum of academia nine times out of ten. I think combining them, would complicate many things as any new policies put in place to help members of the College of Science and College of Geosciences could impair members of the College of Liberal Arts and vice-versa. If y’all are dead set on consolidating some of our colleges I think it would be more beneficial to just combine the Colleges of Science and Geoscience rather than all three colleges.

---

For academic realignment, no attention was paid to the departments losing people, which provide some of the most diversity to the overall graduate student population. For example, the Department of Sociology continues to give some of the most talented students in the field but are not given the tools they need to survive and thrive. My fear as a student is that combining the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Science would further create a discrepancy. Also - if this combination occurs, all graduate students need to be paid the same similar to what our peer institutions do. Otherwise, it just enhances the divide

between the value of liberal arts and sciences working together. Moreover, it seems as if the only logic supporting the decision to combine the department is to provide better support to the "STEM-focused" university. All of our students are not STEM-focused, and the college of liberal arts, which thrives in its production of empirical research, provides spaces for students to understand that learning is valuable in all ways. Students in the College of Liberal Arts already feel unseen because of the university's values on other colleges without uplifting the college of liberal arts. Again, I feel an erasure is happening that isn't being paid enough attention to.

---

In regards to the realignment of the POLS division into the Bush School of Government: I do not agree with the recommendation. The purpose of the Bush School is to provide education and experiences to public servants that goes beyond an undergraduate degree. PhDs are oriented towards academia, not government service. The masters programs based on capstone projects provides students with experience for future careers in the field. Additionally, the culture of the Bush School is unique because of the nature of the programs it offers. The small size allows students to create relationships with each other and their professors to promote professional growth; this would not be as effective in a combined setting. Even if it were combined with POLS, why not also combine with the INTS department too, given the MIA emphasis at the Bush School? The emphasis on POLS alone does not seem ideal if realignment is the goal.

---

Good.

---

Do NOT combine College of Geosciences, College of Liberal Arts, and College of Science. Makes no sense. Keep Liberal Arts separate, they don't even take science classes so should in no way be included in a College of Science.

---

In regards to the BIMS program, I am indifferent towards realignment, however there needs to be change within the department itself. As an incoming freshman, I heard from many upperclassmen BIMS students that classes were extremely difficult to get when U3/U4 status was achieved. Now, I am living that reality. For example, there are a total of 130 seats for the BIMS specific anatomy class (which cannot be substituted) when there are HUNDREDS of students that are needing to take this class in order to graduate. Furthermore, if a student is seeking to pursue medical, veterinarian, or any graduate education, this will be delayed. It is absurd, and this issue is not unique to this anatomy class. It is seen with the BIMS specific genetics and microbiology as well. Students should not have to be panicking or worried about not reaching full time status which jeopardizes their financial aid and their position for further education due to their graduation being delayed. Another issue is the ratio of advisors to students. It is one that is far out of control. Before this fall semester began, I sat in front of my laptop for over 3 hours before I could finally meet with an advisor for an update on my force request because, to no surprise at all, I was not at full time status for the upcoming semester and all of the classes I needed were full. When I finally got with the advisor, the meeting lasted a total of maybe 5 minutes. 2 weeks prior, I emailed the office for an update on the request as instructed from an email sent about force requests to which I received no response until 2 days after I met with the advising staff. This needs to change, and this is also not unique to just me. Please, I urge you to consult other BIMS students about their satisfaction with the advising staff and class availability. The advisors are nearly impossible to get into contact with, which is a huge issue, and it's simply due to the ratio being extremely disproportionate. There either needs to be more advisors/faculty/staff to accommodate for the large number of students, or there needs to be stricter standards for admission to the program. Just about every required upper level BIMS course is full or, most often, overbooked. While growth of the program is good, if other aspects that are vital to students success cannot keep up with it, growth becomes a hindrance. I think this situation asserts very strongly that there is such a thing as being "too big," and I hope to see change for the next generation of Aggies. I love this school, but the problems described above have been more than frustrating and ridiculous. Change is needed for the BIMS department. The same ratio issue is also seen with the OPSA. [REDACTED] both always highlight that there are just simply too many students and only one of them. Don't get me wrong, their work is greatly appreciated, but ultimately not everyone can be accommodated for. The solution is either higher more professional school advisors, or tighten admission standards. I know Texas A&M cherishes being the largest university in the state and one of the largest in the nation, but once again there is a trade off between size and quality. Please also consider this. I'm not exactly sure who will be reading this, but if this message could be please forwarded to appropriate contact for the BIMS department, that would be greatly appreciated because, with all due respect, I know I won't be able to get in contact with an advisor or anyone else in the department to express my concerns.

---

Do not "realign" the colleges. They exist for a reason. Texas A&M will never get a dime from me as a former student if they just slap it in with two other legitimate separate colleges.

---

Recommendation 9a: By combining all university studies majors into one department, there will only be more segregation between students in university studies and those in other related majors. By keeping university studies

students in their respective departments, students have the chance to be fully emerged within their department of choice. While I agree with the idea of A&M needing more consolidation to make things more efficient and cost effective, I do not believe we should do so at the expense of student well-being.

I believe that students that were admitted to the future College of Arts & Sciences under its former names should be allowed to graduate with their respective colleges of Geosciences, Liberal Arts, and Sciences; if this is not able to be accommodated, at the very least, permitting graduates to have their desired college on their diploma would make almost all of the affected student body much more comfortable with the change.

This sounds almost like too much. Although there does need to be an establishment

The university does not have the infrastructure or culture to support the creation of a School of Visual and Performing Arts. The unification of the current programs will not increase involvement in the arts on campus; the current programs currently do a fantastic job of pulling support and participation from students. Serious investment should be made to develop and publicize the Bush School. By pairing it with the undergraduate Political Science department, Texas A&M could become home to one of the nation's premiere institutions of politics and public policy. The department of construction science is currently unique in its culture, system, and career paths because of its placement in the college of architecture, as opposed to the college of engineering. The soft skills required to be successful in construction science are typically devalued by the general engineering coursework and system. The transition of Technology Management is in a similar situation. Allowing spaces for non-engineers to study fields that may be related to engineering allows the university to produce a more diverse, well-rounded set of graduates.

I am not in support of the merger because I have friends in the College of Geosciences who are student workers and are concerned about losing their jobs, and thus their ability to afford to attend Texas A&M University. I also think that realigning these colleges goes against the traditions of TAMU because we have always been different and special in many aspects, and one of the main reasons that the report cites as a reason for the colleges to be joined together is because other universities have all of these colleges grouped together. However, Texas A&M is known for being different and special, always caring about tradition and keeping to the way things have been done and will continue to be done since the creation of the university.

I think combining the College of Geoscience, Science and Liberal arts into one college is an outrageous idea. There are little to no parallels between majors between all three colleges and each one has amazing opportunities (especially the College of Geosciences) specific to those colleges and none else! Yes TAMU is mostly a STEM and Agriculture focused university, and there is a reason for that and there is nothing wrong with that. There is a liberal arts college and just because it's "underrepresented" compared to other Universities does mean we need to combine liberal arts with a bunch of newly centralized science departments and majors. What a gigantic mess that would be. I don't care for the idea of a College or School of Visual and Performing Arts. Again it's not something that TAMU is known for or needs to be known for. Why don't we focus on making the programs and majors we have right now better rather than creating new ones and pushing programs and majors that TAMU has never specialized in. Also, I get that liberal arts is a required elective for everyone regardless of major because Universities seem to think that it helps people expand their horizons or develop more critical thinking skills, etc. But none of the creative arts electives I took were beneficial and I truly don't know anybody who has told me that they learned anything of use in World Theater, History of Electronic Music, History of Rock, etc. They are ALL blow off classes and a waste of time, money, and resources. I am not against Liberal Arts, there are benefits but for the most part, especially with the way those electives are taught (i.e. the lack thereof of instruction and actual learning in those classes) these classes are completely useless to most non-liberal arts major. I know there are communication majors out there that want to major in Journalism but I would be careful of the amount of money and resources that go into something like creating a whole department just for Journalism...it's a dying major and career. I am very pessimistic that a department of Journalism would benefit TAMU in anyway.

As a liberal arts graduate student, I am concerned about the proposed changes to the college of Liberal Arts and combination with science colleges. How would this directly benefit me? It only seems like liberal arts would be further reduced in terms of representation. If you would like to actually show support for liberal arts and recognize its importance, equal funding should first be distributed towards research endeavors, faculty salaries, and graduate assistantships. There are no direct reasonings or benefits outlined in the report for why this combination should happen other than it is what other schools have done. However, the proposed change to the Visualization program and the addition of a robust arts program will only increase the university's reputation and output. It is frankly embarrassing that Texas A&M does not offer ubiquitous art classes such as pottery and allow students to major in the visual arts. Even

engineers need to be well-rounded and have an outlet for creativity and stress.

---

The College of Dentistry should be moved from Dallas to College Station and be made a part of the Medical School. There is a huge potential in the dental field. The College of Dentistry should be expanded to ensure better enrollment. Like the Rackham Dental School in University of Michigan, there should be a lot of money spent on the Dental School and inter-departmental collaborations should be facilitated as cancer research is closely related to dental research. The Medical School, in general, should be expanded and upgraded. There is a lot of potential. Texas A&M is currently heavily reliant on the Colleges of Engineering and Agrilife. This needs to change. More money should be invested to hire better faculty in the smaller colleges.

---

#9a The USAR degree is special BECAUSE it is part of the college of architecture. Take that away and it will be like all other university studies degrees- which are not special. I am a senior USAR major and I believe my job leads so far are based on my "design based" degree and the fact that I was part of the college of architecture. I think USAR is a really cool degree, but I wouldn't have chosen it if it was in a different college.

---

I really appreciated their focus on expanding the fine arts program and providing more of a space for these interests on our campus. As a student with past involvement in the Dance Science program, I have had a front look at the passion of the students in these types of programs as well as how unrecognized they go on our campus. I feel that if we want to continue excelling nationally, we need to make a place for the arts to give our students well appreciated and well funded programs. I agree with the consulting group's assessment of the current programs and the need for expansion.

---

I strongly believe that Recommendation #2: The establishment of a School of Visual and Performing Arts (and relocation of the Department of Visualization) would greatly benefit the student body academically and culturally. By providing the opportunity for students to pursue careers in performing arts, a wider variety of students would feel supported at A&M, while students involved in other majors would have a greater chance to balance STEM-based coursework with artistic pursuits.

---

Please do not get rid of the College of Education and Human Development.

---

Please don't change anything.

---

I honestly do not know my position on the proposed unification of the three colleges. Especially Geoscience is weak on its own, and consolidating them would give them the ability to focus on academics. However, it also causes them to lose stature and independence. Many people in the college of science are concerned about losing funding to support weak or useless departments in liberal arts. There also in such limited subject matter overlap that it doesn't really make sense to eliminate the independent vision of each college. Every individual department would have to be considerably strengthened, and I don't know if that is good management or not. I don't see a need for there to be a full fine arts program. I doubt it would be successful without massive use of resources. We do not have the infrastructure to support such a conservatory performance program and there is no need. I am as happy as can be simply playing for fun in the University Bands. There are enough strong music programs in Texas that building one from the ground up would be expensive and probably inefficient. To me, it simply does not fit the mission and purpose of this University. It is certainly good to expand the arts program and provide for more arts education on campus, but trying to start with world-class musicians is a step too quickly. I support the integration of fine arts program into the College of Liberal Arts. Uplifting and allowing the Visualization department to grow is desperately needed, as it is a strength that is underutilized and its current position in the College of Architecture hinders its ability to increase in stature. The idea for collaboration between engineering and fine arts is a good one, however it requires recruiting specialized faculty and lots of attention as it is technically difficult. The more that engineers can be exposed to the arts, the stronger they will be, especially with the removal of the engineering ethics requirement. I fully support the creation of a Department of Journalism. There is a massive need for this program, and with the success of student media such as KANM and The Batt there is student support for it. The fact we don't have a journalism and media department is a massive oversight. Local news is exceptionally important and civic engagement on this campus is low and a department of journalism would help that. I fully support the expansion and merger of the Bush School. I fully support the creation of the Life Sciences Institute. However, it does not belong in the College of Agriculture. It is a scientifically based field and belong sin the college of science, or at the very least the school of public health. It is good to promote collaboration between biology and agriculture, especially for industry applications, but housing the institute in agriculture is illogical and irresponsible to the scientific foundations of biology and biomedical sciences. They are research and possible med-school focused. Creating a degree program for Librarians is good and a great opportunity to create a pipeline of talent. However, the

management of the university libraries should be kept in a purely administrative sense and not in the college of liberal arts. It creates an unnecessary burden on that college to manage what is essentially a business. Also, Cushing libraries and University libraries should be integrated. Reassigning University studies to Liberal arts is logical and I support it. Refocusing the college of vetmed to graduate programs is good and I support it. I fully support consolidating Kinesiology into Public Health.

---

I think the school needs to focus on giving funding to all its programs and making sure they are offering all the classes they are saying are going to be offered. I know as a graduate student there has been a lack of classes that were promised and it is sad to feel lied to.

---

I do not agree with the suggestion to combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. Go out and ask any engineering student; I bet they will say that the worst part of the College of Engineering is the size. I cannot understand why Liberal Arts would be grouped together with Science. The benefit of individual colleges under such a large university is the specificity, the ability to associate with individuals pursuing a similar career path and to create degree programs appropriate to each field. The leadership of each college can become an expert in their arena, learning how to appropriately govern the education of a particular subject. Each College should not be run in the same way if we want to achieve the best possible education system, as disciplines vary greatly in the way that they are most effectively taught. The proposed benefit to this change was to boost numbers, mimic other universities, and save money. If that is the goal of this university, rather than educating students so that they can make a real difference in their field, then this is not the Texas A&M that I thought I was attending. Do not sacrifice the individuals of each college in the university for the sake of your numbers. I also do not agree with the suggestion to create a new Institute of Biological Life Sciences, containing the Department of Biology and the Biomedical Sciences Program. While many people do not understand the difference between Biology and BIMS, I know that I do, having graduated with a degree in Biology and advised many students switching into the BIMS program. Biology is rooted in hard science: experimentation, pure scientific method, and laboratory education and research. BIMS is more oriented toward healthcare, with classes on anatomy and physiology, history of disease, and medical microbiology. Both degrees are excellent, but they have different focuses to cater to different students. Putting both of these departments under the same umbrella will eliminate the major differences between the two. I couldn't imagine going through the biology degree program if it were not in the College of Science; it was part of my identity to be a student of science, closely integrated with chemistry, physics, and math. It was the interplay between these disciplines that taught me what it meant to be a scientist. It would be more difficult for this to occur if the Department of Biology was separated from the College of Science. I can't speak as personally to the BIMS program, but its strength is definitely rooted in its relation to medical science. Now, I do think that there should be a way for some cross over between the two degrees, such as allowing Biology students to take BIMS electives that relate to biology, but this can be done without a drastic change to overall structure of the departments.

---

Howdy! I am a senior applied math major under the College of Science. After reading the consulting report, I immediately became concerned with the proposed restructuring of departments and colleges. Specifically, combining the College of Science with the College of Liberal Arts would not be beneficial to students in the College of Science. STEM degrees are typically considered more difficult than most degrees offered under the College of Liberal Arts. I do not deny the importance of these majors. Indeed, society needs brilliant minds in those fields, and I happen to know several intelligent, impressive Aggies from this College. However, it would be a disservice to the students under the College of Science to combine these schools. Logically, this restructuring would not make sense because the two schools are vastly different. One way to see this is by comparing statistics for average GPAs in the College of Science and the College of Liberal Arts. Another fact to consider is the percentage of students that do not graduate from the College of Science because of the coursework difficulty required to graduate. The Dean of the College of Science shared this fact during my orientation. It takes hard work to graduate with any degree. For me though, I take pride in the fact that I will graduate with an applied math degree from the College of Science at A&M. I have worked hard studying and have spent hours upon hours in office hours with professors to understand math and do well in my courses. A few recent courses I have taken include Cryptography I and II, Advanced Calculus, and Mathematics of Interest. Students who have been accepted into and completed degrees in the College of Science would not be rewarded by the restructuring of these colleges. I am respectfully asking that the proposed combination of the College of Science and the College of Liberal Arts be rejected. Thank you so much for your time and consideration.

---

The Bush School is a very special place because of its specific focus on public service. I fear that adding the Department of Political Science to the Bush School would detract from the mission that President Bush had in mind when the school

was founded. I agree that the profile of the Bush School should be elevated, but I don't think adding the Department of Political Science accomplishes that goal. I concede that most other public policy and international affairs programs have undergraduate and Ph.D. programs, but those programs don't have the same commitment to public service. If this does happen, the quality of the Bush School and the legacy of President Bush must continue to be preserved.

---

Concerning Recommendation 9c: As a student of the department of Construction Science, (CoSci) I am hesitant of moving the CoSci department under the College of Engineering. Although it may appear the two colleges to have some overlaps, we do not. We are concerned with the actual construction, which is built on experience, management, and people skills, not based on calculations and theories. Additionally, the College of Architecture relates more to CoSci since they design buildings. They do not design other products as engineers do, they focus solely on buildings and of the like, just like CoSci. Furthermore, our degree is involved more with scheduling, project management, and estimating (project forecast / budgets). We are not involved with the actual mathematical calculations for the construction. We are involved more with the process of transforming it from those numbers / plans into reality. Also, the best professors I have had in the department were those who worked in the industry for numerous years. Yes, they may have not had a masters or a doctorate, but their experience made them worthy. I am concerned moving CoSci to the College of Engineering will deprive students from such knowledgeable professors. From what I have seen, the College of Engineering is interested in hiring those with a masters or above. For construction, a masters or doctorate is not needed to show one is skilled or knowledgeable in the profession. For us, our years in the line of work and the projects we are involved in serve are just as important. In fact, I would prefer a professor who has worked in the industry for 25 years than a professor with a doctorate in construction and never worked in the industry. We need people in the line of work to teach what the line of work requires. Another concern I have with moving the CoSci department is losing the CIAC, who both provide us with internships and scholarships. The CIAC serves as our construction network. We are able to apply for internships or full time jobs offered by the members of the CIAC. I personally interned with a company from the CIAC and I believe if TAMU did not have that connection with them, I would have failed to find an internship. On my internship I was able to put into practice what I learned in my classes. I also learned so much from that amazing experience. Additionally, I received numerous scholarships from the members of the CIAC. They helped paid for my education and minimize my educational debt. Through our CIAC, we are able to be one of the departments with the greatest financial aid available. They also inspired me to later on in my life give a scholarship to a CoSci Aggie student. If we lose the CIAC, I am worried future CoSci students would not have these amazing benefits. The CIAC is like our mini Aggie Network. Moreover, I am concerned of how the admissions process would change for CoSci. I am aware the students of engineering go through a general admissions program then have to reapply to the major of their likes. I believe this will not benefit CoSci since students who do not have the passion can be filtered into the program. CoSci requires students to have the passion to manage projects. Additionally, once again, I feel the majors do not align to even be considered in the same "general" classes their freshman year. Our department is well known as being a part of the College of Architecture. I believe if we are in the College of Engineering, our reputation will be overlooked by the engineering majors. Our classes do not align with engineering, we require professors with experience (not a certain degree), we need our CIAC, and we need passionate students who love the major. Please do not let our prestigious reputation as being one of the best CoSci departments be lost.

---

As a senior student that is part of the LAUP (Landscape Architecture and Urban Planning) department of the College of Architecture,(COA) I am strongly against moving any of my fellow classmates, future or present, to a different college. The Department of Construction Science is a core part of any architectural course and it's not uncommon for Landscape Architects or traditional Architects to delve into the realm of construction. To move any aspect of Construction to the College of Engineering is counterintuitive as we often do refer to their teachings and if anything we should be working much closer with our fellow Cosci classmates. The Visualization program likewise is also a core aspect of the COA and has thoroughly been integrated into our college through the help of professors such as Professor Russell Reid for example. To remove the aspect of creativity from the COA goes against the idea of architecture and limits the resources available to students, future or present. With these views and opinions in mind, I have to restate how displeased and disappointed I am with TAMU for so greatly misunderstanding what the COA is and what we do after A&M.

---

I would be hesitant to support a merger between the undergraduate department of political science and the Bush School. First, the report states that this move could help the Bush School become one of the highest-ranked schools of public policy. However, the Bush School is not a school of public policy. It is a public affairs or international affairs school. The ranking that matters most in this regard is US News & World Report's Best Graduate Public Affairs Programs. This is a minor error, but it might be indicative of a larger misunderstanding of what the Bush School is trying to do. Also,

rankings are overvalued. The methodology for the USNWR ranking is based entirely on reputation. This favors older and prestigious universities, even if other schools are doing a great job of teaching students and placing them into successful positions/careers. It also does not take into account finances (average debt at graduate, etc.) or how the school helps those most in need. Having a high rank is useful for marketing and fundraising (and I enjoy that the Bush School has been rising in this ranking), but it should not be the primary goal. Second, the Bush School already admits a large number of TAMU undergraduates as part of the 3+2 program. So many that the average age of a Bush School enrollee is lower than more competitive programs. This has a noticeable effect in the classroom. Although these undergraduate students bring a lot to the table, their lack of real-world experience sometimes makes discussion rudimentary. Third, I don't see how the Bush School benefits from this merger. I would be surprised if any Bush School professors would want to teach undergraduate students. I also do not know how having undergraduates adds to the culture of the Bush School. The fact that the Bush School just offers Masters programs helps it stand out from competitors. This is a benefit. Fourth, I would also caution against adding Ph.Ds to the program offerings. The mission of the Bush School is to train public service professionals. Although many Ph.Ds do work in the public sector, their opportunities are fewer. Producing Ph.Ds also raises a moral issue because so many with these advanced degrees have difficulty finding adequately paying work. Overall, I understand and agree that the Bush School has room to continue improving. But we should acknowledge that it is already growing and improving and not harm its culture or progress by merging it.

---

Please do not separate the university studies degrees from the college they are already in. The university studies degrees are already going to take the classes in the specific college anyway, so there is no need to change where they are.

---

While I get that many universities are moving to a "build your own major" approach to higher education and this can have some great advantages for students with specialized and interdisciplinary interests or career aspirations, I do not think you have to do away with University Studies concentrations in the process of adding this approach. Some students, like myself, like the balance of structure and flexibility as compared with traditional majors. The challenge of the "build your own major" idea is it is created completely from scratch, but these concentrations are useful templates for students and give more depth in a particular area of study without being as specialized as some traditional degrees. Also, contrary to the current impression out there about University Studies degrees, not all students who got in to these majors were ones that failed to get in to other programs. Some students actually chose these degrees and emphases intentionally. For me, this has been such a relevant and rewarding degree, and it would be such a shame to see future generations not get the opportunity to learn about leadership as I have. This is one of those degrees that doesn't just grow people academically and professionally but personally as well. As far as where to house the advising for the University Studies degrees, I agree about putting it in the new College of Arts and Sciences to streamline the administrative processes. However, I hope you can come up with an alternative to keep the specializations, even if it means making them a required minor plus a few extra required courses. This puts responsibility on the student to get approval for the minor within that department and make sure all required courses are completed, along with prerequisites, but none of this is new for the University Studies student.

---

All of the majors should not be grouped into one hierarchy of a system. Each major, specifically university studies, has their own specific purpose and students' should not be grouped just to have a larger college. Grouping all majors together to create a larger college does not, but promote complications between organizations that do not normally work together. Not to mention, people would have to be restructured which would take away from valuable resources that can have a positive affect on students. Being a university studies major varies per college, and taking away that experience to develop around peers, will negatively affect the purpose of university studies.

---

I believe that the USAL major is one of the few that embody all the core values of Texas A&M University. Without this major, I would have not found my place at this university. What we learn within this major I have found my passion for leading and I believe that it would be an unethical decision to take seats this major.

---

I do not believe the merger would benefit the school. The merger would lessen the experience of students. Particularly the geoscience students would be greatly impacted in a bad way. They might not be able to go on as many field trips which is a major part of the experience you come specifically to A&M to get. Everyone in the geoscience program comes to TAMU because the program is amazing and you get to say you are a geoscientist which is not something you can get anywhere else. Also something to think about is IODP and how that might effect the financial standing of the college if the merger happens. General advising on a large scale would not be great for students or current advisors jobs.

---

As a student in the College of Science, I strongly oppose the suggestion to join the College of Science with the Colleges of Geosciences and Liberal Arts. I strongly believe that this merger will decrease the value of the education I am seeking

here at Texas A&M, especially as I came here for studies in STEM. The subjects and disciplines covered by the College of Science and College of Liberal Arts are greatly different and I do not believe this will provide any benefit to the students that it will affect. Although I understand the sentiment that liberal arts majors must feel supported at this stem-focused university, I do not believe a merger with an entirely different college will accomplish this goal. Additionally, I believe it is the responsibility of Texas A&M to put the value of education above their agenda to save money on overhead costs; by merging the administrative faculty between the College of Science and the College of Liberal Arts, Texas A&M will be decreasing the quality of assistance we gain from these roles because the backgrounds are so vastly different. Please consider the students of these Colleges prior to any academic realignment.

---

This is a terrible idea. Keep the college of science and liberal arts separate. It is not like A&M is struggling for money. We need more advisors and more support, not less. Cutting corners by combining these two colleges shows how much y'all prioritize getting big paychecks than the welfare of the students.

---

If I'm reading the MGT's rationale correctly for combining the Colleges of Liberal Arts, Science, and Geosciences into a new College of Arts and Sciences, their reasons seem to boil down to 1) other universities do it, 2) it would benefit liberal arts, and 3) it would reduce administrative costs. However, it seems they have not addressed why different colleges exist in a university. I would say they exist because any problem has distinct facets and having different colleges reflects that there are different mindset-perspectives for tackling problems. A scientist, an engineer, a philosopher, and a public servant will tackle the same problem (say renovating a degrading water pipeline that crosses state boundaries and that is subject to interstate treaties) with different mindset-perspectives because that problem has distinct facets that no single field could adequately address by itself. I believe that Geosciences has a distinctly global and stewardship mindset-perspective inherent in the disciplines of geology, geophysics, geography, meteorology, oceanography, environmental geosciences, and geographic information systems. This makes it very distinct from the more fundamental and lab-based mindset-perspective inherent in the disciplines of physics, chemistry, biology, mathematics, and statistics (though I admit zoology is a gray area). I also believe that these global-and-stewardship and fundamental-and-lab-based perspectives are very different from the interpersonal perspective inherent in Liberal Arts. Science looks at the fundamentals of our natural world. Geosciences looks at the relationships between those fundamentals as well as between people and our natural (non-living) world. Liberal Arts looks at the relationships between people. Based off similar mindset-perspectives, I would say Geosciences with Agriculture & Life Sciences (ALS) or Liberal Arts with Education & Human Development (EHD) would be better combinations; though I think having to deal with life and stage-of-life still make ALS and EHD different enough to remain their own colleges, respectively. In sum: though a stretch, I could see the Colleges of Geosciences and Science combined into a single unit. However, I fail to see how the mindset-perspective of Liberal Arts is similar enough to either of those two to warrant combining into a single college. Thank you for consideration of this feedback.

---

I think a lot of the changes being made are good including the reorganization of some majors to new and different departments. The only one that I would disagree with is the movement of university studies programs outlined in 9a. As someone who just switched into university studies inside the college of architecture, I would like to remain as a student in the college of architecture-where a majority of my classes will be. I switched into this major because I still wanted to be within the college of architecture and I will be sorely disappointed if my program leaves the college.

---

I believe that the dance program should remain in partnership with kinesiology and stay a bachelor of science. The TAMU dance program is unique in the aspect of science. It teaches its students how to go on and be good educators, Physical Therapists, and safe dancers. A new fine arts building would be nice and allow for more attention to the arts but it is important that dance stay involved with Kinesiology.

---

Considering university studies degree plans require students to take a mandatory level of higher level courses designated for their field of study, regardless of their minor choices, it belittles such students to consider them inadequate to be distributed into their individual colleges. Furthermore, taking into account that students pick the university degree plan they want to pursue, it is reasonable to assume that the student has chosen the plan that most fits their unique needs. Perhaps a renewed focus on mission would be helpful, helping clarify to students the intentions of each program, yet this does not mean that students should be moved into the college of arts and sciences as a way to group them, which can confuse the focus of a students study and possibly confuse future employers based on their college.

---

My comment is specifically related to the Technology Management Bachelor's degree, of which I am currently working towards earning. I completely and unequivocally agree that it should be moved to the Engineering Technology school. Where it is currently located makes little to no sense, a significant amount of the course work is useless for my career

field, and the academic support personnel don't really have any understanding of the career field either. The degree as it currently is offered feels more like a Human Resources degree with a few IT classes, which is not at all how it is advertised or should be taught. This degree should be placed in a school and a department that understands what is actually taught in the course work, knows what the career field looks like, and filled with course work that is actually beneficial to that career field.

---

You should not move biology to the college of agriculture. It's not fair to the students to move a prestigious degree to that college. It's not clearly expressed in the report how biology has been underperforming but with the amount of grant money our PIs have brought in that doesn't necessarily make sense either. Currently, I have a 4.0 GPA and would consider myself somewhat smart. However, if biology had not been in the college of science when I was choosing schools as a senior in high school, I wouldn't have come to A&M.

---

Combining these two colleges would be incredibly frustrating to myself and many other students. I am a straight A student at TAMU on scholarship, and I came to this school specifically for the College of Liberal Arts and its programs. Combining this college with the College of Science could lower my GPA, alter my prerequisites for grad school, and limit the attention received by my college. If these two colleges were to combine, I would fear for the future of the Liberal Arts College and its place at TAMU. I love this school dearly and I am so proud to be an Aggie, but I hope beyond hope that you reconsider this decision.

---

Plant science major (Department of Soil and Crop Science) should be an extension of the recommended majors in the recommended institute of biological science. It should be a path that is available for incoming biology majors to extend into.

---

I see the benefits of combining 3 colleges into the College of Arts and Sciences, but as a STEM heavy meteorology major having the words "College of Geosciences" displayed on my diploma would mean so much more to me. A&M has always been high on which colleges I wanted to attend, but I fell in love with A&M through the College of Geosciences. I take pride in being apart of the smallest college on campus, as I'm better acquainted with my professors and fellow students. For admissions purposes, I feel like it's important to note how unique the College of Geosciences is because it's a rare college to be found at other universities, which is a deciding factor to many as to why they decided to come to A&M over universities with similar majors in different colleges. On another note, I'm somewhat familiar with IODP on West campus, and if I recall correctly they're able to receive funding because we are the "College of Geosciences" and not linked to other majors. If there were no more College of Geosciences I would be very concerned for the future of IODP. I can't stress enough how important and unique it is to be apart of not only the smallest but greatest college on campus.

---

As a student that is a part of the Construction Science Department, I DO NOT agree with the department moving to the College of Engineering. Transitioning to this college would not only ruin the culture that makes Construction Science what it is, but it would also prohibit students from receiving the most beneficial education needed for the respectful careers most students from the Construction Science Department pursue, following their college careers. Students would not be able to create the same relationships with our current professors and faculty in the COE. Within the Construction Science department, creating relationships is necessary to be successful. One of the greatest things about this department is the ability for students to create tightknit relationships with their peers and professors, and this is due to the culture that has been established in this major. Many professors encourage Our department relies heavily on professors that have real industry experience, this is something that won't continue if we move to the COE. We would lose many of our faculty members due to COE degree requirements. The professors that would replace ours would likely have little field experience, if any; and this is a crucial aspect of Construction Science that can not be replicated in the COE. A majority of the students in the Construction Science department transfer into Texas A&M following their freshman or sophomore year, and this would be very difficult to offer in the COE. Due to the structure of the College of Engineering, transferring into the college is very difficult. Considering the fact that freshman year of being in the COE requires basic classes followed by the engineering placement exam. This means that students wishing to major in Construction Science will not even be guaranteed that major. If students wanted to be engineers in the construction industry, they are likely going to apply for Civil, Architectural, or Structural Engineering, not Construction Science. In most careers following the Construction Science program, our jobs are more in line with that of architects. COSC students need to know how to read and understand plans, specifications, submittals, RFI's, etc. These are all documents/procedures that would not be taught in the COE, as this is more math based. Learning to read the previously mentioned documents also teaches our students to manage a jobsite as well as give input for better constructability of whatever jobsite they may be on. Another issue that may arise from the transitioning of Construction Science to the COE is a decrease in funding from industry leaders that give a lot of support to the department, both financially and

academically. CIAC leaders show support through scholarships, internships, field trips, and other unique opportunities that are granted especially to COSC students. CIAC members, faculty, and students take pride in the fact that the Construction Science department has grown to become one of the best construction programs in the country without a ton of help from the university itself. Through these relationships, the program has had the opportunity to have its own career fair, and students are given the opportunity to give personal feedback to CIAC leaders and what they believe is and is not working within the program when it comes to academia, this is something students in other majors do not really have the opportunity to do. The Construction Science department is unique in its organization and culture, and that is a large reason for the program being as highly recognized across the country, as it is. Future students will not be able to experience all that the Construction Science Department entails if it gets forced into the College of Engineering. The Construction Science department has given me so many opportunities that I would have never been able to accomplish had the COSC department been in another college.

---

As a Construction Science major I am concerned with the proposed move to the College of Engineering addressed in recommendation #9c. I would like to say that i am not completely opposed to moving to the College of Engineering, however i would like to warn against potentially changing what we now know as the department of Construction Science currently. What makes our department the best in the country is our faculty, students and degree plan. These are the three major elements which i believe make our department the very best in the country and i am afraid if you alter one of these aspects that it would be detrimental. What makes our faculty so great is the industry experience which they have and are able to share with their students. They do not simply teach from the text book but from their lifetime of experience in the construction industry. The second aspect that sets construction science apart is the type of students, we are not engineers nor are we architects. construction science students possess skills and knowledge of building that neither engineers or architects have. Lastly, I would be concerned with how our degree plan may be altered if we changed colleges. I would be cautious of trying to change construction science into construction engineering. We are not engineers and there is a reason construction science graduates have nearly a 100 percent job placement after graduation. The majority of construction companies do not want engineers, they want construction science majors because we can problem solve, communicate, read drawings and most importantly we know how to build. These are each skills that not most engineers or architects possess. I am in no way diminishing the role and purpose of engineers or architects discipline, i am only trying to explain that what we do is much different and should be considered. In conclusion, i would urge the university to take these aspects of our program into consideration and not try and change or make us into something we are not. There is a reason that our department is nationally recognized and i would be very cautious before changing what makes us better than all other construction science departments across the country. Thank you for taking the time to read my response and i hope that you will take my response into consideration. I am very proud to be a student in the very best Construction Science Department in the country, at the very best University in the country.

---

Combining the College of Liberal Arts, the College of Science, and the College of Geosciences to create a College of Arts and Sciences would compromise each of those colleges. They have nothing in common, and combining them just because they are smaller is no reason to combine them at all. They are very distinct and need to be left as they are. I enrolled in the College of Science at TAMU, not the College of Arts and Sciences.

---

Please do not create the college of arts and science. Being a woman in stem is a very difficult thing to do, and to have my records read "college of arts and sciences" for a chemistry degree feels insulting and almost demeaning to the amount of work I have put into this degree. I know it will most likely not impact me directly, but for all of the future students who do the hard work of a stem degree, they deserve the designation of a college of science. Additionally, the liberal arts students are extremely talented in their own regard, and deserve to be treated as such, not lumped into a college that won't be solely focused on them.

---

I do not want the College of Science to be joined with the college of liberal Arts since each of them are important to have each one.

---

After a discussion with my professors and classmates, I feel that we share the same feelings towards the findings of the MGT Report- moving Construction Science out of the college of architecture would be an immense disservice to the students and faculty who strive to make it one of the most desirable majors on campus. After joining Texas A&M as an engineer in 2019, I quickly learned that the atmosphere was not what I imagined it to be. I knew that if I changed my major, it had to be away from engineering. It is disappointing to see a "recommendation" to relocate Construction Science into engineering, as it would greatly affect the number of Students who want to enter the major. Moving COSC into the college of engineering would take away the independence and specialty of the major itself. Similar to COSC,

moving University Studies Architecture (USAR) into another college would prevent the college of architecture from producing well rounded and knowledgeable students under its own wing. It is disheartening reading this report to find such recommendations that would reduce the college of architecture to effectively be the smallest college on campus. I hope there are many other comments similar to mine, as the report feels like an attack on majors such as COSC, which have been major contributors to the university.

---

As a student in the College of Geosciences, I fail to see what the benefits of consolidation into one school for arts and sciences are for student and faculty, and I do not believe any of these benefits justify changing the current structure for the most part. While I understand STEAM education is great and all, Arts really is distinct in its own way and I feel consolidation really takes away from that uniqueness. I also enjoy being in a small college at this university and having it separated shows that the College has room to grow even more on its own as the Earth undergoes changes due to human impacts and climate change. TAMU Geosciences needs more support than ever before, and I feel consolidation would be a disservice and lead to more disinvestment. Other than that, I do not mind the other proposals.

---

Strongly agree and supportive of creating combining visual and performing arts into one school and that school have its own center. Agree with and support moving the departments mentioned out of the School of Architecture so that the school can better focus on it's mission.

---

I am currently taking CLAS 101 and I would love to see a revived commitment to the Classics Department including the Greek and Latin languages as well as their other accommodating classes. This department includes many passionate people that are dedicated to this academic subject but recently this same department has lost a professor and there was no rehiring to fill their spot. I truly believe this area of academia and study is beneficial for everyone who goes looks into it and would hate to see the department start to shrink. Overall, the department is filled with wonderful professors and passionate students and I'd love to see more of that!

---

I think realigning the colleges will have a considerable negative impact to the success of students. Much of the reason that I chose to attend TAMU was the funding in the Department of Oceanography and the renown of the College of Geosciences. By fusing multiple colleges together, you will lose some of the small funding sources and opportunities within the department that make it such a desirable place to be a part of. I want my degree to come from the College of Geosciences, not over a large umbrella of Arts and Sciences. This consideration of realignment does NOT benefit the students.

---

Do not merge completely different colleges. We are different and deserve to be treated with respect for our differences.

---

I do not believe that there should be a college of science and arts. Each department is fine being separated as they are. I believe that some colleges, such as liberal arts, do not even receive enough attention on their own so this move will create an even greater negligence.

---

I am afraid that all of my work will be discredited by changing how the departments are structured. Instead of the full degree, it would just be bachelor of science and not my specific field. You guys strive for individuality and uniqueness but then sum all of the departments into one. Also, combining departments into 4 main ones will cause an unevenness in how many majors and students per department.

---

do not change the curriculum for construction science

---

I am writing in main concern to the MGT report concluding that the Construction Science at Texas A&M should be moved out of the college of architecture. My issue with this finding is that with the program moving to the college of engineering, the program will then have too much of an influence from the engineering curriculum. The Construction Science program at Texas A&M is one of if not the best program in this field in the country. The program has reached this by staying focused on the management aspect of construction rather than the design. This leads me to my main argument on the issue. I have spent the past several years doing internships in the summer. One conclusion I can make is that the design and building side of construction are two very different roles. Construction managers are much better suited to have a diverse set of knowledge in the building side of construction rather than engineering. What separates our program from many other schools is that we are driven by the industry leaders as well. This can be seen from the professors to the past alumni that give their input to what the program should be focusing on. Another extremely unique aspect of our program is that we have an very high job placement rate post graduation. This means that companies think extremely high of our program and want to recruit from here. I think this is mainly because the program is so focused on the building side rather than design. In my personal opinion one of the biggest issues I have seen in my short time in the construction industry is the lack of knowledge in the building aspect of the field. By this I

mean there is constantly issues with the design teams giving drawings that are incorrect. If the program moves towards the design side of construction this issue will only get worse. I respect everything the design team brings to the table, however the two programs should work together rather than blend together. In summary, I have been honored to be apart of the construction science department at Texas A&M. I truly believe that the program has put up the frame work for a successful career in the industry. Furthermore, I would like to see the program continue to provide a world class education for future students.

---

The department of Construction Science should not be changed. We are proud constructors that work towards the same goal as an engineer but in a completely different way. Our goal is to construct and not to design, and if we were to transfer to engineering, we would not be competent in our field. In our field engineers are not sought after because they do not know how to build and this would hurt our job opportunities. What it means to have a degree in Construction Science from Texas A&M would not carry the same weight. The history that we have created and the roots in the many companies is more than each of us and shall remain the same for the future constructors.

---

It would be an incredible disservice to the mission and legacy of President George H.W. Bush to merge the Bush School with political science. The Bush School is made of students who have self-selected to join a distinguished alumni population who are dedicated to an elevated, serious life in public service. Two of my favorite things about the Bush School is the small size of the student body and the small, but impactful and important group of former students. Another important point of my selecting the bush school was how prestigious and separate it felt from the main campus. The relationship between the Bush School and the main campus is just as it should be. Similar to Mays. Separate, but together. It adds a level of prestige. If you want to combine Bush with public science, then combine Mays with business administration.

---

None

---

I agree that BIMS should be paired with biology because I wasn't able to get into the classes I needed for my degree multiple semesters. If I hadn't of taken so many BIMS electives, then I would've switched majors the day I couldn't get into a science my junior year. I had to take anatomy in the summer to graduate on time due to the university allowing too many people in the major without hiring additional professors. I know multiple last semester seniors (including myself) in BIMS 320 because we were only now able to take it (due to animal science majors or BIMS minor students taking our spots). There's nothing more frustrating than paying money to come here and not being able to get the classes you need. If I had to do it over again, then I would've done research and chosen a school where you could actually get into classes you want.

---

I absolutely disagree with the finding of MGT in regard to moving the Department of Construction Science to the College of Engineering. The overall goals of these two do not align the same and a move would be a detriment to the students.

---

The academic realignment suggestions make no sense and would harm the biology students. Truly i believe were doing great things i see myself thriving in a department like this. Being a Bims students as undergraduate, i can compare both departments. I can say that this department is amazing and i love being a part of it. I wouldn't change a thing so neither should the provost.

---

I strongly support Recommendation #2: the forming of a School of Visual and Performing Arts, and relocating the department of Visualization to this school. This would better represent the academic mission and the culture of the student body of the visualization department, and provide opportunities for the college of visualization to become a leader in new media education (especially in film and game development). Increasing the size and resources of the department would also allow for better collaboration between the Visual & Performing Arts dept and the College of Engineering. Currently, hybrid degree plans like the Game Design and Development minor have a great deal of interest from Engineering students, but are limited by the resources provided to the college of visualization.

---

The report states that the Biomedical Sciences program will be placed under the College of AgriLife. While this is good for the BIMS majors who wish to pursue a career in veterinary medicine, this is not beneficial and may even harm BIMS students who wish to pursue a career in human medicine or academia. The current structure of the BIMS program allows for students to focus on their area of concentration and by placing this program under the college of agrilife, it will undermine BIMS students pursuing careers in human medicine.

---

I believe that realigning the college of science with liberal arts will be of benefit to all in those colleges. At previous universities I have received degrees at, these two colleges are combined and provide opportunity for interdisciplinary research and collaboration. Creating ideas and research otherwise unconsidered or difficult to coordinate. Additionally all programs will benefit from a more centralized and increased funding structure. This benefits undergrads, grads, and

faculty alike. It will help all of the involved departments to properly fund grad students and faculty at levels commensurate with our peers and make our school an even more enticing R1 institution for these developing and great minds alike to work at, influence, and produce groundbreaking and informative research.

I do not think that the College of Sciences and the College of Liberal Arts should be combined: however, I do think that the College of Geosciences should be combined with the College of Sciences. I definitely think a School of Visual and Performing Arts should be established- we lose too many possible students to schools with music and art degrees.

Broadly, I have found that the college experience of students in the College of Science and the College of Geosciences to have very little in common with that of those in the College of Liberal Arts. While the students of science often find their experience dominated by the extreme and time-consuming academic rigor of their degrees, those in Liberal Arts degrees spend more time building connections and pursuing new interests. To be sure, there are many exceptions to this generalization, and to a large degree its accuracy depends on the major, but these are still two very different college experiences. In this light, it seems odd to presume that administrators for one college would know what is best for students of another college, should they be combined. Concerning University Studies degrees, I have less insightful input. I cannot gauge the effectiveness of the recommendation to centralize them to a general studies college, but it seems to be built on a characterization of the University Studies degrees as appealing to students without the "qualifications or interest to enroll in a College degree program." However, I have found that these programs actually appeal to high-achieving students, some of whom do go on to graduate programs. Obviously, because I oppose the creation of the College of Arts and Sciences, I would not agree with the recommendation that it undertakes the University Studies degrees.

I am a doctoral student in HLKN graduating in May. This program is full of drama to put it frankly with so many organizational issues and faculty and staff turnover that there is little structure or support for grad students. After attending this program for three years I can't blame the faculty who have left this department as I don't think the drama brought forth by the faculty is worth anyone's sanity. HLKN has been absolutely unhelpful as they continue to go through reorganization with faculty and curriculum. HLKN needs to put a prime focus on addressing a lot underlining issues dealing with mentoring, discrimination, and diversity. Half of students deal with not having a chair or advisor being present or dependable during their time here. The only professors who have been helpful during my dissertation journey are from outside of the HLKN department and I would prefer to work with them. When it comes to curricula there are too many faculty members who basically teach the same classes. Most of our classes coincide with SPH and many of the grad students are getting a certificate from the SPH program. I completely agree with putting HLKN under SPH and encourage you to do so. I also think you should work towards diversifying your faculty as well as incorporating mentoring and diversity training especially within the department of HLKN.

Although hearing that about the possibility of a Department of Journalism excited me at first, it does not anymore. I fully support Dr. Blanton's alternate proposal for a "Department of Communication and Journalism." The ties that the journalism degree has developed with the department of communication as it is have been great and many of the goals listed in the MGT report are currently being met. As a former editor of The Battalion and perhaps one of the most prominent students enrolled in A&M's journalism degree, I think that speaking with people like me as well as journalism faculty would help make better-informed decisions regarding journalism at Texas A&M. I understand there may be alumni support for a Journalism Department because many former students graduated from the old department, but they are out of touch with where things are now and the progress that has been made with the journalism degree in the department of communication. I would love the opportunity to speak with anyone regarding this matter. My email is bradystone18@tamu.edu.

Moving construction science to engineering is stupid. We are in no way engineers and the engineer course work is unrelated, I know because I transferred out of engineering. Engineers are more similar to architects because they both design while construction science is about taking the designs to build or estimate or do actual work, not design and ensure everything others build is up to code.

As a student in the department of Construction Science, I believe that the inclusion of research in the field and at RELLIS facilities is an exciting proposal and would benefit my education greatly. With that said, I believe that the culture and communication between students, staff, and especially industry professionals that we have now is very integral to the caliber of construction degree that TAMU offers. If moving to the college of engineering means that Construction Science can uphold the core benefits that we have now (such as collaboration with the CIAC professionals and having professors that have real field experience over many decades), then I am for the move, but if we destroy our very best traits the degree and regard of our program within the industry will plummet.

I do not believe that academic realignment in terms of moving Biology into the College of Agriculture would be beneficial to anyone. The Biology program is one of the most lucrative graduate programs in terms of bringing in grant money, research publications, and allowing undergraduate students to get research experience. Biology is an intensely collaborative department, both via the sharing of knowledge and resources between the labs, and separating everyone will lead to a detrimental loss in productivity all around. Furthermore, Biology grad students depend on the TAs to supplement what their labs can provide and to allow for more students to be in Biology labs. Loss of that funding would leave many grad students underfunded, potentially leading to debt and an increased rate of students leaving without a degree. Personally, I am from an interdisciplinary program that is much less composed and supportive than Biology, and I feel lucky to have been welcomed into Biology.

---

I am currently a University Studies student in the College of Architecture. I feel that if we were to be moved into the College of Arts and Sciences it would be detrimental to my desire of being well-rounded in the Architecture world. I did University Studies- Architecture because I wanted to learn and understand a touch of what each architecture niche there was. I have always prided myself in being in A&M's College of Architecture and by this move, I would feel cheated out of that dignifying title. I also think that the architecture community is so intimate that if we got put into a bigger college it would make each student feel less valued and more like a number. I believe that being identified with a specific college gives each university studies student a deeper identity and pride in their major. Please consider not making the change for University Studies students.

---

I would like biology to be kept in the college of science

---

Regarding Finding #5 To say that there is a perception that the Department of Biology is 'underperforming' based on the comments from the interviews without any metrics to accompany this statement is preposterous. I have been in this department since 2016 and I have noticed a dramatic positive development of this department in every way. The department has been hiring new professors, several who are the top scientists in the field, the funding levels are equivalent to the top-performing departments in the University, there is an increase in the number of graduate students recruited, despite the more stringent selection process. The remark that most peer institutions do not have a stand-alone Biology department is false. Vast majority do, and only Cornell, which is mentioned as an example, does not. There is no confusion among the students regarding the selection of appropriate majors, the degree offered by the Department of Biology has a clear focus on general biology, unlike the those offered by the College of Agriculture and Life Sciences and the College of Veterinary Medicine and Biomedical Sciences. This proposal to merge Department of Biology with the others mentioned under the same Institute is unnecessary, and poorly argued for. Again, there are no metrics which to go by and the statements comparing our university organization to the others are false. The Department of Biology should remain in the College of Science, independent, and it will soon become even greater than it already is.

---

I am unsure if this goes specifically toward this comment box or not, however, I need to put it somewhere and this seems logical. Removing the Construction Science program from the college of Architecture is a mistake. Although there are areas of Construction Science which factor in a bit of engineering knowledge, it is no way related to engineering how it is to architecture. Being that Texas A&M's Construction Science program is one of the best in the Country, why fix something that is not broken. Just because there may be a more feasible or financially rewarding reason for "centralizing" Texas A&M's Educational Programs does not always mean better, and is it really worth doing so if you are negatively affecting the students whom this will affect, at least that is the whole reasoning for this, correct, the students?? Also, Consolidating the degree program of University Studies to the College of Arts and Sciences is a huge mistake, starting with the reasoning. It was stated that doing so is "To ensure that each college focuses on its mission and are not distracted with students who do not have the qualifications or interest to enroll in a College degree program, the University Studies program should be unified in the College of Arts and Sciences." I would like to see the evidence and the University Study program students who would state the reasoning of their educational path is due to their lack of qualifications and interest. The University Studies program includes many areas of education in a certain realm, would this not suggest their capacity for MANY interests and this program allows them to learn about many aspects of a particular college and industry?

---

Texas A&M's meteorology program is ranked number one in the nation, and people will travel across the country to come here. One of the main things that draws people to our program is that we have the resources of a large university, but the close-knit community within the College of Geosciences. Combining the College of Geosciences with the College of Science and Liberal arts will remove that factor and make our program less reputable. People will choose not to come

here if we offered a BA in Meteorology instead of a BS. Additionally, a lot of graduate programs require a BS to continue studies, and changing that would make our program less reputable.

I am a graduate student in the molecular and environmental plant sciences interdisciplinary program, however I work in a biology lab and am therefore a part of the biology department. I am also the president of the biology graduate student association. I did my undergrad at A&M, graduating with a biology degree from the biology department, therefore I have perspective as both an undergraduate and graduate student when it comes to Texas A&M's department of biology. For undergraduates, I think merging programs to streamline biology related majors is good. It takes out the confusion of having to decide which college to join. However, as a graduate student, I have concerns. In the report, it states that the biology department is underperforming. This isn't accurate. Therefore, any need to change the biology department based on underperformance is unnecessary. Secondly, major restructuring of the department is concerning for graduate students with regards to home labs and funding. Large-scale merging like this is bound to see lay offs of not only staff, but faculty as well. There needs to be assurance for current graduate students that they will not also be kicked out of the department or kicked out of their lab, forcing them to change paths mid-degree. Related, there also needs to be assurances for funding. Merging will also reduce the number of required TAs. Many graduate students depend on TAs for funding. It is necessary to have backup plans and support for any graduate students who may lose TAs, as this could jeopardize their future in graduate school. Having been a part of this department for 8, going on 9 years now, it's run very effectively and efficiently. Both undergraduate and graduate students have many opportunities and much support, both academically and personally. Our community is tight-knit, and while every department could be improved in places, the biology department is one of the best. I worry that these large-scale changes will disrupt the internal structuring and personnel which make the department what it is. It will displace graduate students and harm the department-wide collaborative and support networks. While these proposed changes may improve the university in the long run, the effects it will have on current personnel, including and especially graduate students, needs to be kept in mind and planned for.

Many aspects of the academic realignment seem to be a bit misunderstood. The school of architecture is a fantastic school and set up properly and shouldn't be tampered with. Specifically construction science. In the real world construction science majors specifically relate to architects and not necessarily engineers. It is one of the best majors to receive at our university and manages to have great success rates for all of its students. Therefore these changes don't make sense and shouldn't happen. Don't try and fix something that isn't broke.

As a student of Biomedical Sciences, I think combining Biology and Biomedical Sciences is a terrible idea. Biomedical Science students are intentionally held to a higher standard because of our goals. BIMS is intentionally harder, and although we take many of the same classes as Biology students, ours are elevated and require more. Biomedical Science prepares you immensely for your future in medicine, whichever path you may take.

██████████ and I am one of the top undergraduate researchers here at Texas A&M. I am Texas A&M's Rhodes Scholarship nominee and have been admitted into the Mount Sinai School of Medicine—a top 20 medical school located in New York City. I have conducted extensive research within the department of biology, and my concerns about the MGT report are almost exclusively focused on the issues pertaining to Biology and the potential creation of a new "Institute of Biological Life Sciences" (Finding #5 and Recommendation #5). The perception that the Biology Department is underperforming is simply not true. It is totally unclear what data this perception is based on. Biology faculty have made clear that not a single member of the Biology Department, nor the Dean of the College of Science, was interviewed in the generation of this report. This year alone, the department has brought in upward of \$21 million in new external funding. Together with established, highly successful mid-career and established senior faculty, the research trajectory is on a solid upswing. We also have extensive collaborations within the College of Science. The Biology Department is also recognized on an international stage for our excellence in key research areas, including Biological Clocks, Spinal Cord Injury, Evolution & Ecology, and Microbiology. The department is attracting world-class, ultra-competitive new faculty members because of our department's "brand". We are not simply performing at an "acceptable" level but we are excelling in our research. Here are some statistics that clearly demonstrate the effectiveness of the Biology Department's teaching mission. (1) The DFQ rate of BIOL 111 reduced from 40.7% in 2015 to 11.2% in 2020. (2) The first-year retention rate of Biology majors increased from 83.9% in 2015 to 95.9% in 2020. (3) The number of bachelor's degrees in Biology awarded in 2020-2021 is already over 40% higher than the last academic year (without factoring in 2021 graduates). (4) The number of 1st-generation college students graduating with Biology degrees is already over 80% higher than the last academic year (without factoring in 2021 graduates). (5) The number of Biology undergraduate majors has increased 57% since 2016 (currently 1942 undergrad majors). This compares to 12%

over the university as a whole. These are just some statistics that demonstrate that the department is far exceeding an “acceptable” level of teaching. Additionally, Biology departments are almost never in Agriculture schools, and such a move may hurt research and disrupt ongoing initiatives in the College of Science. If Biology is asked to move to the College of Agriculture & Life Sciences, I am convinced that this would have an enormous net negative impact on the University. I have been so fortunate to receive the benefits of the remarkable biology education and research here at Texas A&M, and I know that Texas A&M would suffer tremendously in the future if the recommendations outlined in this report are implemented.

---

I think combining Liberal Arts and Science is a bad idea. The reason given for combining the colleges is because other universities are doing it, and that should not be why the colleges are combined. Trying to create the rationale that after joining the colleges, somehow Liberal Arts would have a bigger advocate and trying to sway people into thinking that is somehow the right decision? Texas A&M is one of the largest universities in the country. If they really wanted the College of Liberal Arts to have a bigger advocate, that would happen, but since the university is more concerned about those in STEM and the money it brings. I know that Texas A&M is more of a science-based university, and yet it was still my top school for a Liberal Arts degree. Liberal Arts, in general, has a reputation for having blowoff majors, but at Texas A&M, that is not the case. I have difficult classes where I am actually learning things and being challenged. I know those who are STEM who have struggled in Liberal Arts classes, and I think the college is on the right track when challenging students while still teaching them. It is a struggle trying to realize that even though I am not in STEM, I am still an essential part of Texas A&M, and taking away the college I chose is not the right decision. The university is all about saving money unless it comes to STEM, and it is unfortunate to see that colleges could be combined to save a few dollars. Despite this university being science-based, I was always proud to be a part of the College of Liberal Arts, and I think most of those in the college would feel the same. I do not believe it is the right idea to join colleges together just because other major universities have. Honestly, I do not believe that the students will play a factor in the university's decision when it comes to all the recommendations. I genuinely think A&M is just covering all of its bases. If something stirs up in the future, it can be said that our opinions were taken into consideration, and the university has an out. However, I hope I am wrong. I hope that our opinions are heard and that it is shown that the university genuinely cares for each student despite the blatant show that the university only truly cares for athletes and donors. Listen to the students because we are all here for a reason, and we all have something to give.

---

I am a PhD candidate in the Department of Biology and have been here 5 years. The Biology Department is one of the most supportive and strongest departments to be part of as a graduate student and one of its major strengths is the wide variety of research areas available because of our status as a stand-alone biology dept. The research labs in our department are incredibly productive. Students, both undergraduates and grad students, are genuinely supported and faculty and staff take an active interest in constantly examining and, when needed, making changes to improve our experience in the department. One of the primary factors that attracted me to the current Department of Biology was the huge research diversity taking place. I did not want to be in a department where I would only be exposed to a select subspecialty. I value the broad spectrum of biological research occurring here and that I get regularly exposed to through department events, seminars, and internal conferences. I believe that having a dedicated, stand-alone Department of Biology is one of Texas A&M's current strengths! Reorganization as suggested by the MGT report would cause an enormous amount of disruption to everyone in our department from faculty to staff to students at both the grad and undergrad levels. I prize our current structure, organization, and the faculty and staff that work in our department. Disruptions and reorganization seem like they would inevitably cause confusion and delay for some grad students, plus the potential to rob us of current strong support that we rely on and benefit from.

---

Although 12 out of 19 peer institutions use the model of combining the colleges of science, geosciences, and liberal arts, it would be much better to integrate the college of geosciences into the college of natural sciences and leave the college of liberal arts to be on its own. The college of science is already big with the number of biology undergraduate majors and graduate majors, on top of our astounding chemistry department for graduate students. Adding more majors into this college will distill the success and muddle the advising and assistance that the college provides for its students. This would hinder the publishing record of the college and inhibit its grant acquirement. The school of visual arts should primarily focus on other arts that UT Austin does not already dominate along with UNT and Texas State. This would help it pass through legislature. Same for the college of journalism. Do not create a library sciences program as UT already dominates that field. Centralization of the buildings for the biological life sciences department would be necessary. Currently, there are a variety of buildings on campus that serve as biology centers for research so major reconstruction is necessary for this to work administratively. Something to include would be whether neuroscience is a part of this or

not.

---

I am an International student from Ghana and got the opportunity to do my Ph.D. at the Department of Biology after my graduate program in University of Ghana. The emotional, academic and financial support provided by my department is overwhelming. The graduate support staffs, graduate advisors/HOD and faculty members all ready to help you succeed. They always have their doors and arms opened for their students plights. Most important to me is their utmost support for diversity and inclusion- they've organized seminars and short talks on matters relating to diversity and inclusion in science and research. One other initiative in such direction is the creation of a weekly class termed as "pizza class", where we graduate students share our plights and worries with our Graduate advisor over lunch. The faculty members are all involved in interesting and fascinating research that's cuts across range from the evolution of organisms through to Microbiological study of microorganisms to the translation into medical physiology (neuroscience). Principal Investigator (PIs) share their intellectual knowledge with us the students during weekly seminars and journal clubs. Most PIs have grant from a variety of sources such as NIH, NSF and so on and published articles in high impact factor journals. This provides support to the graduate students working in those labs. The department cumulatively had grants over 2 million dollars over a short period, which to me is a step in the right direction. They (department) hired new faculty members in order to increase their research base and are looking at employing more. I feel so honored to be a part of the department especially at this phase of their growth because automatically it positively affects we the graduate students. I believe the department is on a trajectory at the moment and sincerely I thing a moving or merging the department with another will most likely halt decrease this forward thrust. Thank you

---

I hope I am grandfathered into staying on my current path towards my degree in BIMS. Additional coursework, more administrative actions, and/or moving into a new building will only prolong my time at Texas A&M and prevent me from going to my job offering.

---

I'm a senior graduate student in the Biology department. When first reading the report I was surprised at the perception that the Biology department was underperforming. On a first note, having been a undergraduate as well as a graduate student in the department, its hard for me to understand how the department can be seen as underperforming. My experience throughout my academic career in the department has been nothing but positive and conversations I've had with other graduate and undergraduate students have always been of praise for the commitment of the faculty and staff to help students in any way possible. On a second note, the department has hired new faculty in a variety of areas for the last three years. I've personally attended many of the prospective faculty candidates talks and lunch's hosted by the department and aside from seeing a myriad of people with great projects and ideas, I've also observed their excitement with the possibility to join a department that is expanding and advancing. It is my personal opinion that the Biology department is and will continue to be a place where research and teaching exceeds students expectations when first coming in and the separation of the current faculty throughput other departments will only delay the path of the department to continue to grow.

---

My major concern comes from rationale #9 and they are as follows; 1. To imply that a University Studies major (such as myself) does "not have the qualifications" to be in a specific College degree program is simply unfair and not true. Starting in the College of Engineering and switching to the College of Architecture after two years, I still maintained a 3.5 gpa. To break that down into further detail, my gpa for Fall 2020 was a 3.5 while being in 18 hours. The mean gpa for a student in the College of Architecture this semester was a 3.256. Spring 2021, our first semester back to in person classes, my gpa was a 3.75 while the average was a 3.268. 2. To say that a University Studies major (such as myself) is a distraction to other students is not only unfair to me, but my peers as well. Countless times, in both my Construction Science classes as well as Urban Planning classes, have both my classmates (who are in the specific degree) and I benefitted from each other in terms of studying, projects, homework, opportunities, and many more. 3. To assume a University Studies major (such as myself) is uninterested in enrolling into a College degree plan is a flawed statement. I would actually make the argument that I am more interested in the degree plan because of the path that was taken to get there. As someone who changed their major very late, I was over the maximum hours to get into most degree programs. Because of this, I had to take a different path to achieve hopefully the same end goal. In this path, I have to attempt to obtain the same information with many restrictions on the classes I am able to take within the degree program. 4. As someone who switched from Engineering to Architecture with a focus on Construction Science, there are not a lot of major connection between the two. To start off, the professors that I have had in Construction Science care much more about their students than the professors I had in Engineering. Not to assume this is the case all of the time, but many of my professors in Engineering seemed to care about their research more than their students. If this change

enhances research opportunities, wouldn't this problem only get worse? If the goal is to remove University Studies from the specific college, at least give the students the option to change to a degree plan they are interested in. This will allow future students to enter the degree that they would like to pursue, no matter what hour mark, or other special circumstances they are in.

honestly still don't understand how combining the college of liberal arts, college of science, & college of geosciences is going to "advocate for a liberal arts education at a stem-focused university" (as stated in the report). feeling sad for those who enjoy being in smaller majors at such a giant university, like students in the geosciences program.

No student that is enrolled in COSC will be able to perform at the level of an engineering student, or even complete the prerequisites for the engineering school. As well as taking out a university studies major you are getting rid of a big group of critical thinkers that are able to mesh in with the other students. None the less the way it was written in the report was degrading and unacceptable as a student in that major. By no means would I want myself to be considered "unqualified" because I am a university studies student.

USAR students are not "students who do not have the qualifications or interest to enroll in a College degree program" the program is a way for us to get to our goal. A lot of us come from different backgrounds, and having more hours than what the programs require does not mean we do not know what to do with our future. If there were no interest we would not be here, getting into Texas A&M University was as much of a challenge for USAR students as it was for any other degree, we are not just getting what is left, we are doing what is needed. This opportunity should stay for future generations because just as it is right now, dedicated people who know what they want are going to be transferring in and the credit hours should not be an obstacle to getting what they have been working for. Also, construction and architecture should stay together because in the construction industry both areas need to have mutual understanding and separating the colleges would only increase the gap and make it more difficult for those who graduate under those degrees. Lastly, the college of Architecture in TAMU is the reason why many students chose to be Aggies, it is one of the most successful colleges in the US, then why would it be good to dismantle it?

So I think that when you say that University Studies students are a "distraction" from the departments mission was really uncalled for because me and a lot of other students were forced to change into university studies due to having too many hours to transfer into our preferred major. Also many of the students in University Studies are in there because they are told they have more options to go into careers once they graduate. I think each department should be able to keep their own university studies degree. Another thing I want to address is that I do not think that the liberal arts college and the college in science should be combined. Just because other colleges do doesn't mean we should. I like that those colleges are separate. If any colleges should be combined is Health and all sciences. I don't know where the advising part should go. While yes sometimes its hard to contact all the required advisors, I do not think that combining all the different advising departments. I think a better idea is to maybe have an extra advisor who is able to know all the other departments. Its already hard enough for all of them to know the requirements for the graduation, let alone if you combine the entire advising group.

The realignment of the colleges are not only illogical but insulting. Grouping eighteen different majors into four is a nightmare. It is clearly to show that engineering is priority here. I am a USAR major and in your report I was told that I am a distraction to students that are better than me. There is no reason to put someone who wants to earn an architecture degree should grouped up with many different majors. A college of arts and sciences makes no sense. Arts and sciences are opposites. A chemistry major should never be associated with a gender studies major. The deans of these colleges are not going to be able to do their job when they are covering so many different majors. Construction Science is the number one program in the nation and your plan is to change it. Why? All of these changes seem like changes just for change sake. There is no logical reasoning behind it. Was there any consulting with this? Not to mention that your agenda to make Texas A&M a liberal arts college also just does not makes sense. This is not a liberal arts college and many people came here because it is not. You are changing the university that people have chosen to go to. People chose to go to one of the greatest schools in the country, not an engineering and liberal arts school.

making 4 colleges out of 18 not only shrinks the college it also limits what A&M and its students can do limiting peoples options with only 4 colleges will turn away incoming students because they might have wanted to go to one of the colleges that would be gone wont want to come to the school now faculty and students will be upset also those who give money and work with the school will find it a turn off if you get rid of the colleges they graduated from and give money to

Extremely opposed to the plans to move COSC and USAR programs. Specifically unhappy with proposed plans for USAR.

I transferred into Texas A&M in the summer of 2020. I really wanted to enroll as a COSC major, but I transferred in with 80+ hours, meaning I was ineligible. I was extremely bummed out, and my advisor told me that USAR was the next best option and he guided my degree plan to mimic a COSC major as much as possible. While these new changes will not affect me, I do not believe it is fair to move USAR into College of Arts and Sciences. Many people within USAR have absolutely no interest in any of the professions that seek out graduates from a college like this. On top of that, for people like me, who weren't even allowed to apply to major in COSC but still want to take similar courses— If we stayed within USAR, and graduated with a Arts and Sciences degree, that would be a HORRIBLE look to any employers within construction industry. Would probably move us down the list and in the current job market, that's not fair.

---

This statement is in regards to the University Studies program directly from the MGT report: "To ensure that each College focuses on its mission and are not distracted with students who do not have the qualifications or interest to enroll in a College degree program, the University Studies program should be unified in the College of Arts and Science". As a student who plans to transfer into the University Studies program, I do not see myself as a person who does "not have the qualifications or interest to enroll in a College degree program". This statement is offensive and is simply not true. I am a student who desires to learn about the business industry while also obtaining knowledge about architecture and comparative cultural studies. I believe this program will best suit me for my future and the goals I hope to achieve after college. Please reconsider moving this major to the College of Arts and Science so that students like me can best achieve an education that will prepare me for my future.

---

I think exterminating the college of architecture would be diminishing towards the university and deter new students from coming to the entire college. After all the motto "aggies helping aggies" is not carried out by this action. Because after these changes are put in place we are no longer giving students the opportunity to chase their desires and branch out. This decreases the interest in the school because now the smaller colleges like architecture will no longer be available. Which many students come to this school to find their little niche instead of being crammed into a giant "sciences" college. After all the college of architecture specifically the construction science majors are leading the nation in the industry after graduation. Getting rid of this not only diminishes what we have built here but also the name of Texas A&M as a whole.

---

Overall disagree with the proposed realignments. Visualization should not be in a college with performing arts as Visualization is closer to animation and graphic design which is deeply rooted in the College of Architecture. Along with this USAR students should not be pushed into a singular college because the University Studies program gives students a chance to explore possible majors or have a place to wait while waiting for acceptance into a related major in the respective college. As an Environmental Design student myself, I was also confused as to why the program was ignored. I have been more than happy with the programs offered through the school of architecture. I believe that architecture combines arts with fields such as engineering and needs to remain as its own college because of its unique nature. Also, the Department of Construction Science being moved to Engineering would hinder the recognized program and lead to fewer students being enrolled in this vital degree. The College of Architecture has nothing wrong with it, so why should a program that has succeeded for so long be dismantled?

---

This report is a joke and needs to be revised like crazy. I disagree with everything that was proposed and think that this report needs to be made more aware to the students. The most absurd thing that this report could have proposed was Rationale #9a. I am a USAR student and am disgusted that the writers described every USAR student as some distraction to the college and does not have qualifications or interest in a college degree program. "To ensure that each College focuses on its mission and are not distracted with students who do not have the qualifications or interest to enroll in a College degree program, the University Studies program should be unified in the College of Arts and Sciences." This is a shame and disgrace to all of the USAR students. We are not distractions and unqualified, I think whoever wrote this proposal is such.

---

It's wrong to move around the College of Architecture around and eliminate it. It's very hard to find a college of architecture and it's valuable to the school. You'd lose money and lose students if you change it. It's not broken, don't "fix" it.

---

This is stupid, college of architecture is a gem at TAMU. TAMU COSC is the #1 COSC school in the nation. Why mess with it! We work with architects for a living. Projects go more smoothly when the project manager is working side my side with the architect. Don't mess with it!

---

I feel that the College of Architecture should not be dismantled. The College of Architecture produces leaders in the construction industry. There are many companies that recruit at A&M that would lose the opportunity to hire Aggies

upon graduation. Moving COSC to engineering is an awful fit for COSC students.

---

-I disagree with Construction Science being moved to the Engineering Department. I believe the current program for Construction Science students, like myself, is perfect to prepare us for the future in the construction industry. I believe if Construction Science needed to be pushed out of the Architecture Department, then it should be it's own department.

I think that the recommendation of changing the COSC department from Architecture to Engineering is ridiculous. The department of COSC has been nationally acclaimed for the students past and present entering into the workforce. The reason for the success of these students is 1 the curriculum being taught and 2 the professors teaching the curriculum 1 The curriculum being taught in COSC is highly valuable to students that work at project managers and superintendents, not engineers. These two professions are drastically different than one another, and mixing these two degrees does not make any coherent sense. Project managers and superintendents are leaders in their field of work, and have to combine other skills and knowledge including math, building practices, knowledge of structural systems etc. The current COSC degree does an extremely good job of helping their graduates become well rounded managers. COSC has a lot of students coming from the Civil engineering and stating that they much prefer COSC. Putting COSC in the department of Engineering will make a lot of future students stray away from COSC at TAMU, and bring the level of curriculum down to many other schools who offer degrees in construction science or construction management. 2 The professors teaching in COSC are a good mix between having good first hand knowledge in the form of APT professors and highly-educated professors. APT professors are what make COSC a highly productive department. Having a master's degree means absolutely nothing until you are able to apply this knowledge to real world scenarios. The professors with master's degrees provide good information of the theory of construction, but the APT professors provide highly valuable information through real-world experience. That is why TAMU COSC majors are so successful coming into the workforce, because they actually know how to apply the knowledge given to them. My final gripe at the proposals listed in how the interviews and surveys were covered. According to the report, the interviews with students and faculty were done over the summer. This makes absolutely no sense, because the vast majority of the student body and faculty are not here during the summer. I do not know anybody who received a chance to voice their opinions for the report. If the report actually wants to present real opinions on the topics of they should do the report again during the semester. The President it supposed to make choices that represent and benefit the entire student body, and in my opinion this report does not factually portray our opinions and interests.

---

I have concerns in regard to Academic Realignment Recommendation #9c, specifically with the suggestion to relocate the Department of Construction Science from the College of Architecture to the College of Engineering. I am a senior Construction Science student who is graduating in December, and I feel that this plan would prevent future students from having the same amazing experience in this major as I have for a few reasons. One reason is that our program focuses on the importance of industry experience more heavily than other programs, as there are many things that can only be learned in the field. Many of the Construction Science professors who are considered a staple of the program and have greatly contributed to my education directly have a lot of industry experience to share, but they may not meet the requirements of a College of Engineering professor. If these professors were to lose their job and no longer be a part of the program once it has been moved to engineering, I feel that the program would lose tremendous value. Another issue that I have with being moved to the College of Engineering is that if basic engineering class requirements were added to the program such as higher-level math and sciences than we currently have, then this could "weed out" future students. Our program is greatly business and management focused, and I don't believe that any higher-level math or science classes would add benefit to the program, as they are not necessary in the lines of work many Construction Science students enter. The last issue that I have would be if Construction Science students would need to be general engineering students for their first year and then apply for their specific major how engineering students do currently. This would detract future Construction Science students from coming to A&M since they would not be in their major for their first year and cause them to look at other schools instead, hurting our program's image. Our major has many transfer students, including myself, and this would also make it more difficult for students to transfer in. I hope that you reconsider moving us to the College of Engineering. It may help the university to reach the goal of 25,000 engineers by 2025, but it would hurt the Department of Construction Science.

---

"To ensure that each College focuses on its mission and are not distracted with students who do not have the QUALIFICATIONS or INTEREST to enroll in a College degree program, the University Studies program should be unified in the College of Arts and Sciences." This phrasing poorly reflects the intentions of students involved in the USAR programs at TAMU. Students in the USAR program at Architecture can be passionate about multiple interests in the

college. The program allows them to get a broad sense of all areas so they can make a more informed decision at graduation. Calling these types of students a "distraction" implies that the school does not care for the needs or goals of students that pay tuition to attend here.

---

As an University Studies of Architecture student, and as an Aggie, I am deeply sadden to read the finding of the Academic Realignment report. Texas A&M claims to follow the Aggie core value of "respect" in our education system, put though these claims it shows it does not apply to our administrators. By claiming our University Studies degree is distracting and that the students are "not qualified." I have been deeply offended to learn that my efforts and studies are not recognized or appreciated at this institution. I feel no need to justify my qualifications as my high school and college transcript speak for themselves. Knowing that TAMU is more worried about saving the system money rather than the interests of the student body speaks volumes about TAMU. Is is known that construction science is the number 1 program and is composed of 25% first generation students. I encourage administration to ask the students about their USAR experience, not just the random 60 participates that happened to be on campus during summer for this study. Coming with an associates degree from high school, I was advised by faculty and advisors that the USAR program was competitive and HIGHLY recommended. By labeling me and my peers in USAR as "distracting" or "less qualified" is an insult to my education. I chose to give feedback for the future generations of Aggies, the education I have received from the College of Architecture is priceless to me and I hope others can have the same opportunity rather than being pushed to the side. It seems clear TAMU does not seen general studies students to be "qualified" or passionate which could not be further from the truth. I ask for TAMU to prioritize their students education rather than FURTHER TAMU financial gain.

---

I believe as an Economics student, that you should 100% look into investing into the Bush school for undergraduate students. I believe this will help students get a better look on the issues and problems in our world today as long as many more opportunities to see for our future. Not only will it be better for better opportunities, but also this will help with the current students with internships through the Bush school branch located in D.C. Whatever action you are to take, I would recommend change because the curriculum and the college of liberal arts, has failed to open students to job opportunity yet has managed to endow us with certain agendas and politics in the classroom.

---

I am very opposed to moving the Construction Science Department to the College of Engineering. I was originally enrolled in General Engineering, and I switched to Construction Science because it was more suited to my aptitudes. I am terrible at programming, which is central to engineering degrees. If the department was moved to engineering, students would be forced to take many classes above their academic level. This would discourage students from joining Construction Science. In addition to the deterring effect this move would have on future students, it would also affect the relationship that Texas A&M has with its industry partners. There is a large number of construction companies that recruit heavily from the Construction Science Department. These companies are always impressed with our students and the way their hands on education has formed them. We have a fantastic department, and moving it to a different college would be a very risky maneuver. I would like answers to the following questions: How would engineering classes improve the relevant abilities of construction science students? Would construction science students be able to use a semester for an internship like they currently do if the department is moved? Would the "Entry to a Major" process currently used by the college of engineering apply to students who wish to study construction science? Would students have to meet the high admissions requirements for the college of engineering to study construction science? Is it beneficial for Texas A&M to make changes just to make itself more comparable to other universities?

---

As someone who is in the University Studies of Architecture degree program, I just wanted to say that calling us "students who do not have the qualifications or interest to enroll in a College degree program..." is extremely generalized and not at all true. I choose the USAR specifically because I am able to take courses from all of the Architecture departments. I did not have a solid idea of what I wanted to learn about, and the USAR program allows me to test all of the waters so to speak. By saying this, the report is insulting me and my fellow USAR students. Having a University Studies program specific to the College of Architecture has enormous benefits and moving it to the proposed "Arts and Sciences" College would remove almost all of those benefits.

---

I strongly encourage the movement towards the creation of a performing arts schools. as a premier university in the state of texas, I'm surprised we don't already have one. This movement would overwhelmingly diversify the student body.

---

I think that moving the Construction Science program to the College of Engineering is a horribly bad idea. Our Construction Science program is the best in the nation, if it isn't broken, why would you change it. Not only will tuition rates go up, diversity will go down, and there will be a drastic decrease of Construction Science students. Also the

centralization of advisors is also not the move we need to be making. degree- specific advisors are a great tool that I know I personally use frequently and taking away the ability to get personalized degree help isn't good.

I think this is a terrible idea. I am apart of construction science, and I would not have been in this major if it was apart of engineering. I have learned to really enjoy construction science and to think that I wouldn't have found what I like to do because it being in engineering makes me mad. I would have gone through college doing something I didn't like and I don't want my future Aggies to go through college doing things they don't like. I strongly disagree with this move.

As a current USAR student, I disagree with the construction science and USAR departments proposed dismantlement. I do not understand the need to disrupt departments that are functioning beautifully. I also do not agree with the comment in the report about USAR students being unsure of what they want to do career path as well as "distracted." The majority of USAR students including myself chose USAR to allow for the knowledge on many categories in the architectural field.

As a current COSC student I do not support the decision to move COSC to the department of Engineering.

I think combining Arts & Sciences into once college is a great idea that would adequately prioritize and compartmentalize programs. Establishing a school for the Visual and Performing Arts is absolutely fundamental to the growth of Texas A&M as a well-rounded university. My experience at Texas A&M has been one fully invested in the humanities since my second semester, and every semester the opportunities seem to deplete. These classes have taught me more about leadership and my own humanity than any STEM class I've taken (though by no means do I underestimate the importance of STEM as well). Strengthening the fine arts curriculum (and starting with actually offering the classes that are advertised) would be an excellent start for Texas A&M. I also believe that a department of Journalism would be highly valuable. Many people I have known have specifically chosen an education at the University of Texas over Texas A&M because Texas A&M no longer has a legitimate Journalism major outside of University Studies. This is a fundamental part of education that should no longer be skimmed; even public high schools offer journalism programs. I don't believe it would be beneficial to merge the University Libraries with any single college, as the Libraries are meant to serve the entire student body. The Libraries function very well as an individual entity, and while I really love the idea of starting a Library Science program at Texas A&M, I believe the university would be better off hiring new people to teach those programs and leaving the existing librarians to continue doing their jobs within the library. I do really like the idea of refocusing the College of Architecture to give adequate development opportunities to the Visualization program. It belongs more under the arts than it does Architecture.

In regards to the recommendation #9C I strongly disagree with moving the Construction Science Department. As a current student I can tell you that nobody in the department is excited about a change. Construction Science is able to develop a very specific graduate who has immense knowledge of all aspects of the construction industry but also learns how to be a salesman, a mentor, a leader, and most importantly a tool that any construction company will be able to use directly after graduation. Moving the department to the College of Engineering would change this culture and shift the focus to the technical side of things which the majority of successful students out of this program couldn't do.

I am honestly not sure about recommendation about the College of Liberal Arts and the College of Science being combined. I can't really see the implications outside of them being together, but I do think it would bury certain majors that aren't as well known. Usually majors are list under each college, and that would be quite lengthy. The report states that there "should" be cost savings with this change. If majors aren't affected and money IS saved, then I would be behind this, but even the reports makes it seem like the financial implications are not completely known. I think there needs to be a very long discussion period before making such a change. For Recommendation 2, I completely support it. As I mentioned earlier, the visual and performing arts opportunities here at A&M are very much lacking, and the arts are an integral part of the human experience in general. As musician myself, I love the idea of adding applied instrumental and vocal performance curriculum. I also think more Visualization to the new performing and fine arts department would make a lot of sense. As for the Institute of Biological Life sciences, housing all the biological sciences together makes sense, especially when it comes to being able to move majors or focus on one specific pathway. I am confused on whether it's one or the other on creating this Institute and combing the Liberal Arts and College of Sciences though. That definitely should have been made clear. Recommendation 6 is one of the worst by far. The libraries should NOT be under any college. They should remain equal in order to serve all TAMU students and staff fairly. Recommendation 9b seems like a good idea. TAMU should do what is possible to uphold an elite veterinary program. However, I feel like vet students and the vets at the hospital should be heavily consulted so that the hospitals can continue running at maximum efficiency.

Please keep the College of Geosciences as one college. It is helpful to have all the focus on geosciences and have more opportunities.

Moving Technology Management to Engineering Technology is a wonderful idea that would allow students in the degree program such as myself to get a more enhanced learning experience with more experts in that field

While Texas A&M University is known worldwide as an engineering school, it cannot be ignored that the College of Liberal Arts remains the second largest college by student population. Breaking up, or combining the College of Liberal Arts into another college would have an adverse impact on administration and in the even of an academic merger, would have to compete internally for funding. Liberal arts is already an underfunded field in the world of STEM and a merger with the sciences would only exacerbate this discrepancy.

n/a

It would be unfair to try and merge 3 very unrelated colleges (the college of Geosciences, Liberal Arts, and Sciences) under the same umbrella -- both to the students who would be affected by the change and to the people who these students would later affect with their tampered educations.

Recommendation #1 does not make sense from a student's perspective. It seems as if this is a way to reduce staff and funding on an administrative level, but funding proportions would likely stay the same between departments within the proposed College of Arts and Science. This recommendation aims to make our university exactly like other peer institutions. I appreciate that our university is unique and would prefer to see us improve the funding, reputation, and credibility of existing colleges rather than conform for the sake of being similar to our peers. The proposed College of Arts and Science is a catch-all for smaller majors disguised under the illusion that combining forces will increase funding and credibility of the arts and social sciences. For example, Recommendation 6 suggests that University Libraries be added to the College and Recommendation 9a proposes that University Studies become part of the College of Arts and Sciences as well, presumably because these programs do not fit nicely elsewhere. As a student about to receive a Bachelor of Science in Psychology, I do understand the plight to increase visibility and credibility within the College of Liberal Arts, but there are no details explaining how this change would actually improve funding, accessibility, or credibility in our programs.

Tamu should stay and operate the same. No changes.

My name is [REDACTED] and I am a senior Biology major. I am writing to request that the department of biology and the department of biomedical sciences not be merged into a single department, as I think these departments serve vastly different purposes and such a merge would damage the world class education provided by the Department of Biology. As some background on me, I entered A&M with an interest in studying neuroscience. I started as a Biomedical Sciences major, as there was no neuroscience major at the time of my arrival and I had expressed a vague interest in psychiatry to an academic advisor, who suggested I enter BIMS. During my first year in college, however, I became more interested in basic research than in professional school. The BIMS department did its very best to stifle my curiosity. I had meetings with BIMS advisors where they explicitly told me to not take classes I was interested in because they wouldn't help me get into professional school, even though I was no longer interested in professional school. I felt as if the BIMS department was simply trying to get me to check all the boxes I would need to look like a good applicant. I switched majors to Biology due to the Biology department's emphasis on learning for learning's sake. The biology department changed my life. I have had countless experiences with impeccable faculty members who have taught me what it means to be a true scientist. I am preparing to graduate with a 4.0 GPA and 3 years of research experience in the Department of Biology. I plan to enter a PhD program and eventually become a professor. Though I have yet to submit my PhD applications, professors at universities such as Yale, Harvard, and UC San Diego are so impressed with the research experience I have gained during my time in the TAMU Biology Department that they are already trying to recruit me into their labs. I would not be this successful were it not for the impeccable care and efficiency of the biology program at A&M. Furthermore, all of my biology major friends and research colleagues believe the biology department to be an impeccably organized system. In conclusion, the Biology Department functions impeccably as it is. I think the Biomedical Sciences department is the one that needs work. Merging the Department of Biology with the Department of Biomedical Sciences may poison the Biology department.

Concerning Recommendation #1, combining various colleges into the College of Liberal Arts and Sciences: I am a graduate student and did my undergraduate degrees at the University of Illinois Urbana-Champaign. I have no problem with a combined college of liberal arts and sciences in theory, but in my experience in the College of LAS at UIUC, the

science majors were nearly forgotten. During our orientation we were only told about the importance of a Liberal Arts Degree, and never how important science was. We had eleven required courses in various parts of the liberal arts (Western, NonWestern, Minorities, Language, etc), but only two to four in science/math. Our LAS newsletters one semester had over one hundred Liberal Arts events and zero science events (there was one engineering event from the College of Engineering). If for every "liberal arts" degree requirement the "science majors" had to do there was one "science" requirement the "liberal arts" majors had to do, it would be fair, as an example. I just want to hope and ask that in a combined college, none of the "component colleges" are neglected, as the "College of Science" was at UIUC.

---

I am currently an MFA student in the Department of Visualization, College of Architecture. I totally agree with the suggestions provided in the report. The department of Visualization currently has two graduate programs: 1) Master of Science and Master of Fine Arts. However, the curriculum is skewed towards the Master of Science program such that there are only one or two courses for Master of Fine Arts. Only a few, such as Dr. Felice House, and a few others can teach MFA students. Most of the faculty members major in computer science, math, and animation. As an MFA student, for me and other future students, we need to take computer graphics and programming, such as Python. We don't have any courses such as studio design, color theory, painting, etc. I've first entered this program expecting that there are more resources for MFA but now I don't get why they maintain the MFA program. Professors who do computer science and entertainment thereby have power internally, so things will not change without revision suggested by the report. There is only one room for MFA students, no desk, no cabinet, no place to draw and paint at all.

---

I believe the College of Liberal Arts should remain organizationally separate from the Colleges of Science and Geoscience (the latter of which can be absorbed into the former). This will ensure that administrators at the college level are able to better represent the unique interests of liberal arts and sciences. It is important for academic administrators to be closely acquainted with the programs in their college, and combining liberal arts and science will hinder this close relationship between administrators, students, staff, and faculty, as science administrators will have very different academic backgrounds to that required by liberal arts students (and vice versa)

---

It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

Please do not absorb liberal arts into the college of arts and sciences. It doesn't make any sense and please just leave us be

---

I do not agree with the reports recommendation of combining the College of Geosciences with other colleges. This would dilute the purpose of the college and give a substandard experience for students and faculty alike. Instead of combining colleges I believe improving them as individual colleges will yield better results.

---

Moving COSCI and VIZ out of the College of Architecture would negatively impact the value of each program within the college. Interdisciplinary curriculum, organizations, and competitions strengthen the programs and prepares students for their careers. Moving these two majors would effectively halve the college that is unified and depends on support from one another.

---

It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

I don't not support the combination of science and liberal arts. These interests and majors are two very different things on opposite sides of the spectrum. Students choose their major based on where their interests lie and often times that is in either science OR liberal arts. As a student who wants to attend graduate school in the medical/science field, I would rather not be associated with a liberal arts program or College. I believe this association of science and liberal arts will damage the reputation of all programs involved. They simply don't belong together and have reputations to uphold separately.

---

I am in strong favor of moving political science to the bush school.

I think that Construction Science should be kept within the College of Architecture. Much of their work aligns with tasks that the other departments have to consider and go through in order to create a sound design. However, Visualization could either stay in the COA or be moved to one that encompasses more art-based majors and both would be fair.

I cannot stress enough how detrimental this realignment will be for students. A&M's liberal arts department is not its strongest point. Combining it with the science department to create an arts and sciences college would cause the liberal arts program to decline further. Arts and sciences are incredibly different, to the point where this makes no logical sense. We implore you to prioritize your students' education quality over the money the realignment might save.

I support the College of Sciences assimilating the College of Geosciences, but I strongly oppose merging the Liberal Arts College and Science College. Liberal Arts and Sciences are so different they should not be put in the same College. In addition, the libraries should be independent from any particular college. It is inappropriate for one college to oversee the libraries while the other colleges do not.

In response to alignment #9c I feel as though moving construction science into construction engineering would be a mistake and should be avoided. As construction science and architecture do go hand and in hand in the construction field it would only make sense to keep these two programs under one umbrella. Construction science allows for a healthy emphasis on trade knowledge as well as practical business applications. Taking the prestigious program and moving it into Zachary would do it more harm on the national ranking.

AGLS 235 has been an extremely useful and informational course. It has been a top resource in bettering my financial skills as a young adult in college.

n/a

I do not agree with this new proposal as it takes away the specificity of each major as we are all grouped into one section and are forced into a college that we were not prepared for. This can take away the focus of our major and it can force us to take classes that are unnecessary for graduate school. Moreover, taking classes that we were unprepared or unequipped for can potentially decrease our GPA and hurt us in the long run. This can also increase expenses and decrease opportunities for grad school as money is tight and as classes decreased our GPA.

This is an AWFUL idea. I understand wanting to find a new way of creating a bigger college, but you will be messing with so many programs that are happy with where they are. A School of Performing Arts seems interesting. A department of journalism will not work. The College of Ag and Life Sciences has a journalism program that is doing a tremendous job. Texas A&M University used to have a department of journalism but shut it down due to not being as beneficial as it could have been; why do you feel the need to try this again when it was proven to not work? Giving the Bush School some undergraduate work with combining it with political science seems great. Do not take biomedical sciences away from the veterinary school. This program is only as successful as it is now because it is paired with the veterinary school. Merging the libraries with the proposed new college could lead to the dean of the new college potentially gutting the budget for the libraries for other needs which would only serve to hurt all students across campus. This also makes it seem as if the libraries will only serve one college which could lead to the other colleges wanting their own libraries which would just be a mess. Recommendation 9d is the worst recommendation of all. This recommendation just seems to be an attack on the College of Education and Human Development. This college has a focus, not only on developing good teachers, but also on HUMAN DEVELOPMENT in general, as it literally says in the name. The School of Public Health has a completely separate and different program than HLKN since HLKN has a focus on education, not on policy, like SPH. They worked hard to distinguish these programs. Also, the TCMG major should stay where it is for now. The majority of the students who enroll or transfer into TCMG do so because they could not make it work in the engineering department here so this program does wonders for the retention of these students, which also helps serve for increasing the diversity of the university as a whole. Do not mess with the College of Education and Human Development.

I do not think that the College of Liberal Art, The College of Science, and the College of Geosciences should be combined because that takes away the uniqueness of each major. This would mean a whole bunch of students who do not have much in common are grouped together and that would create problems with advising and enrollment. It would also be very confusing for students who are going to grad school because there wouldn't be one major that would suit their needs.

It helps in maintaining the academic standard.

In specific with the Department of biology, I do not think at all it is underperforming. This year we have a big PhD cohort where everyone was given the opportunity to work as a TA with a great salary. The department has hired young and new professors which are doing cutting-edge scientific research and they have lowered different grants. The department is very productive, and we have the opportunity to know each other face-to-face, because we are not a massive department.

---

Regarding the proposed movement of the Department of Biology: I, a graduate student and a former undergraduate student from A&M, specifically returned because of the independence of the Department of Biology and its situation under the College of Science rather than an agricultural college. Our methods and subjects of study are better aligned with the interests of Chemistry and Physics and the like, and our administrative staff and faculty are very much available and in touch with graduate and undergraduate students alike. In another vein, on one hand there is a stated intention to make the proposed College of Sciences and Liberal Arts quite large but the movement of Biology out goes directly against that stated initiative by moving some 3,000 to 4,000 students out of said college. Many of my colleagues agree that they preferably sought out admission here for the fact that our Department is housed with Sciences - not Agriculture. Further, our department is significantly more robust than the comparison to UNT; we simply are better known and generate more research, I never even considered an application to UNT. The creation of academic tracks for entry level biology students is not inherently bad, but need not require complete shuffling of multiple departments. At a minimum this topic should undergo further study including dramatically more direct back and forth conversation between faculty and students and the administration; survey's are useful but are no substitute for administrators that are making these decisions scheduling meetings to host faculty, graduate students, or undergraduate students to directly hear and respond to questions.

---

Regarding the recommendation to combine the College of Arts and Sciences together. I believe that there is no reason to combine the colleges. It would create unnecessary restructuring as the current structure is stable and has been working for the department and School of Science. The only reasoning for combining the departments would be for the new College of Arts and Sciences to be "comparable in scale" to other peer institutions as per the MGT report which is not sufficient reasoning to combine the departments creating unnecessary restructuring which in the long term would create problems ultimately affecting students.

---

I strongly think that moving the Construction Science department from Architecture into Engineering is a very bad idea. We are one of the top construction science programs in the nation and trying to change its course will create a very negative atmosphere. From this the program will potentially lose a lot of interest and a good chance of the program will die out. We should be in the Architectural college because we work straight with architects in the field not engineers. In the construction science department here, I feel as if we are a small family and not just a number. I have talked to many engineers and they feel like just a number there. I strongly hope that construction science do not get moved. Thanks!

---

The Bush School should not be merged with the Department of Political Science. Ask any Bush School student what our favorite parts of the program are, and you will inevitably come across the following answer: isolation from undergrads. We love that our buildings are far from theirs; our parking is separate; our classes distinct. It is a highlight of interview weekend. When undergraduates are in our classes, the quality of our learning frequently decreases. We are all very frustrated to see that several rooms in the Allen building are now offering courses to undergrads, who are loud, do not follow our dress code, and take up our study spaces. Not only would the inclusion of undergraduates disrupt the Bush School's culture of excellence, I would argue that overlap between the school and the Department of Political Science may be less than imagined. The Bush School's focus on training national security practitioners and other public service professionals is different than Political Science's focus on theory and academia. We come to this program explicitly because we do not want to earn a PhD. The School's small size is also a huge selling point for incoming students. Unlike alternative institutions like the DC schools, the Bush School has dedicated faculty who are here for us, the Master's students, and only us. Their offices are right down the hall and their doors are always open. That's why I came. A merger with the Political Science Department would chance this irrevocably. The Bush School works. Don't let other departments swallow it whole.

---

Moving COSC out of COA makes perfect sense.

---

On the subject of removing the majors of Construction Science and Visualization out of the College of Architecture; the majors mentioned above should stay in the college of architecture. Although they appear to be majors that are not academically related to outsiders, students and professors see otherwise. Those same majors, skills, and professionals work side by side in many instances in the professional world. Generally speaking, construction science majors become

contractors of some sort; landscape architects and architects design places, spaces, and experience and these are constructed by laborers who on many occasions are led by contractors. At the same time, visualization majors can at times become full time renderers for models of projects that architects and landscape architects work on. Urban planning students also work side by side with architects, landscape architects, contractors, and others. The majors being in the same college gives students an early exposure to how the professions are related and assists in strengthening the skills necessary for future professionals to succeed in the "real world". These are just a few and broad ways the majors are related. Instead of transferring these majors into different colleges, an option would be to increase collaboration between the proposed new colleges. Contractors, architects, landscape architects, and planners will all at one point work with engineers (structural, civil, electrical, etc) as well so increasing the exposure to that major/profession would benefit all parties involved but construction science and visualization majors will benefit more by staying in the college of architecture. All in all, this change would not benefit students as much professionally and possibly reduce the quality of entry level professionals coming from the university.

---

I am writing specifically to express my concerns with the plan to move the TAMU Dance department to the School of Visual and Performing Arts. The dance department here at Texas A&M is very unique in that it is the only Dance SCIENCE program in the state of Texas and only one of very few here in the United States. This is what makes our program so unique and draws students to it. It isn't like the dance departments at Sam Houston, TWU, or TCU that focus on performance. Instead, our program focuses on looking at the science behind dance, and in doing so lets us explore how we can help improve the health of dancers as well as how dance can be used to improve the health of the general public including the elderly and those with special needs. Moving the dance department out of the Kinesiology department would limit the access we had to classes that make our dance program unique like Exercise Physiology, Motor Learning, Exercise Biomechanics, etc. All of these classes prepare the students in the Dance Science program for their future endeavors. Many of us go on to become Physical Therapists and Occupational Therapists. The combination of the dance and the science allows us to be unique and desirable when applying to these graduate schools. It would be doing the students and the university a great disservice to move the dance department away from Kinesiology and away from our science routes.

---

Howdy and to whom this may concern, [REDACTED] I am a senior USAR major at Texas A&M university. It also is important to note that I am double minoring in communications and art and architectural history. Recently the president of Texas A&M, Katherine Banks, released a report regarding changes and transformations to the University that will ultimately alter the history of the tradition. Ms. Banks has a vast background in engineering and is decorated with achievements within engineering which play a significant role within her report. According to Ms. Banks, on page 39 in rationale #9a "To ensure that each College focuses on its mission and are not distracted with students who do not have the qualifications or interest to enroll in a college degree program, the University Studies program should be unified in the College of Arts and Sciences. The program staff can work collectively with all University Studies students to develop plans of study that meet expectations for both student and institution. The concept of a "Build your own major" is not unusual and can be a positive experience for students who do not want to follow a traditional path to a degree." This statement or rationale is flawed. It is unsure where Ms. Banks concludes that majors like University studies are distracting and do not meet the qualifications or interest to enroll in a college degree program. I am interested and nonetheless qualified to be in USAR and a double minor in communications and art and architectural history. The idea of developing plans of study to meet the expectations, i.e., graduation requirements of the University, already exists. However, I believe this is a loophole for Ms. Banks' agenda she seems to be presenting. This report does not help Texas A&M and is a scathing attack on the students and faculty who have been loyal and patient throughout the testing times over the last two years. It is apparent that Ms. Banks lacks the idea of the Aggie core values; therefore, I will repeat. Respect, Excellence, Leadership, Loyalty, Integrity, and Selfless Service are the tools to change the world, and these values will be our guide as we pursue equality for all. This report lacks Respect, Excellence, Leadership, Loyalty, Integrity, and Selfless Service. This report ultimately has decided that I no longer hold interest in continuing my graduate education here at Texas A&M as planned. I have grown up dreaming of being an Aggie, saying the words We are the Aggies, the Aggies are we, true to each other as Aggies can be. I feel left behind like I do not matter. I know I am not the only one who feels this disappointment. If I was not intelligent or held the competency, I doubt A&M would have admitted me, but I am. I will end on this, How is it that A&M being the most excellent University it is, allow itself to contradict their own choices and decisions and tear their students and staff down to the point where no one is sure of their future here? I hope this feedback will create clarity for whom it may concern. Thanks and Gig 'em. Jordyn Miller

The concept of moving the biology department to the department of agrilife is quite frankly absurd. One of the first questions asked to biology majors on the first day of freshmen year in intro bio is "how many of y'all are pre-med students?" and it's usually about 1/2 to 2/3 of the lecture hall. It may be justified that different derivations of biology majors are spread out across different departments however when considering unifying them all under a single college (which I think is a good idea), why was the first thought to place them all under the department of agrilife? To add insult to injury, biomedical sciences is also being added to this list. What justification is there to place all of biology related majors under agrilife over the college of science. If the school was to use a fraction of the money used to contract this consulting firm and perform a simple google poll asking which fields are most associated with science, Biology would place somewhere in the top 3 ranked with chemistry and physics. Furthermore, the claim that the biology department has been underperforming may be true in some regards however there has been at least \$20 million in funding to the biology department alone in the past year from non-tuition payments so it's probably safe to say that the biology department is holding its own. The college of science carries with it a certain degree of prestige. The prestige associated with a biology major will be tarnished if it is moved to the department of agrilife. Lastly, I'd like to be frank in saying that it is a display of insecurity and weakness for the largest school in the nation to be making such drastic changes in such a short period of time due to comparison to other schools. Every school does things differently but whenever such a vast proposal is justified because Cornell does things a certain way, I just think that that is a failure to the students, a failure to the alumni, and a failure to the school as a whole. Texas A&M takes pride in its traditions. It's all over campus. People are scared to walk under a dumb tree alone because of these traditions so when I see the school justifying a decision of such gravity with the fact that other schools do things a certain way I cannot help but feel betrayed by my own institution. It's real nice to know the school has my back when it chooses to boot out biology from the college of science while at the same time somehow finding enough room for the entire college of liberal arts.

---

I am an Environmental Geoscience major at the college of Geoscience and I believe it would be in our best interests to not merge the College of Liberal Arts, Science, and Geosciences. The merging of these colleges would negatively effect Geosciences General Advising as its advisors are already so in tune with its scheduling and its specific majors. Merging these schools would not only only create more confusion in course registration, but less helpful general advising in geoscience specific majors. I was also talking with some of my fellow Geoscience peers and we agreed that this merge would discourage students from going into the College of Geoscience, further reducing A&M's appeal. I personally came to A&M due to it having a well developed Geoscience program and I believe it has an important role to play as its own College.

---

Hello. As a Biomedical Science major perusing medical school, merging the school of science with liberal arts is an awful idea. Foremost, liberal arts and science are to completely different fields of study. A lot of science majors are not strong in liberal arts, that is why they chose a field of study under science because it supports their strong suits. This school is going to alter a long of students tracks and curriculum if you do this. Please do not force students to take classes that will not benefit them for their future careers.

---

I don't understand how combining the College of Liberal Arts, College of Science, and College of Geosciences helps strengthen the support for liberal arts education? To me, it sounds like this restructuring could potentially reduce it, especially if the funding for these colleges is combined. I do see how establishing a School of Visual and Performing Arts, Department of Library Sciences, and a Department of Journalism can help bring more focus to liberal arts education. I fully support the expansion into the arts because this will make A&M feel more balance. It will obviously bring in more non-STEM students but also allow for STEM majors to take electives in these areas. Even as a STEM student, I've always felt like there aren't enough efforts to celebrate and support humanities/liberal arts/fine arts students in Aggieland. I don't know if it would be necessary to combine the college as recommended to achieve this goal. I am worried that trying to combine those colleges would make them lose too much individual/unique funding or dilute the student experience.

---

I believe that the merger of the college of science and the college of liberal arts is a mistake and not one that should be completed by the university. Obtaining a degree in the college of science comes with a prestige representative of the work and knowledge required to fulfill the degree requirements. Graduates of the college of science go on to work on some of the biggest challenges facing the world today. To equate this degree with a degree in liberal arts by placing them under the same college is a grave mistake that will lower the significance of a science degree. To do so simply to reduce overhead costs and attempt to bring more liberal arts majors into a university renowned for producing outstanding STEM students comes across as an attempt by the administration to meet some talking points without any real benefit. I do not think this is a wise idea.

Frankly, I feel this is the worst proposition by far. To combine the college of liberal arts with that of the college of science and geosciences is a disservice to students and faculty under each college. Each college has a unique mission- a mission facilitated by the independence of the colleges that allow for purpose-driven work towards developing coursework, knowledgeable faculty, and a sense of belonging students feel when in a college where others are working towards similar goals. In addition, students that intend on progressing into professional school deserve to be distinguished on the basis of their specific education, and not lumped in with others. A degree from the college of science carries more weight than would a degree from the College of Arts and Sciences as it shows strong academic focus and commitment to education in the field. Having seen students choose not to attend a university on the basis of the college that would administer a certain type of degree, I chose Texas A&M for the prestige that they convey but refusing to confide in such a way. To disband this would be a disservice to both former and future students, and I fear that there would be diminished recruitment of high-quality applicants as a result. Furthermore, I particularly argue against including the Life sciences under the AgriLife designation. I feel that this is a misinformed recommendation that could have profound impacts on both current students and future recruitment. A vast percentage of the students in the life sciences intends to pursue medical school, PhD's, and other advanced educations. As a student applying to medical school, I can attest to the fact that I would have not come to this university if my degree in biology was not under the college of science. Many peers share this opinion as this degree is essential in our success as we work towards continued education. A degree in Biology from the College of Agriculture would entirely miscommunicate the focus and extent of our education. It would be a blow to the prestige which fortunately surrounds our university, for students and faculty alike would be far less inclined to bring their high level of talent to A&M and would likely go elsewhere. This is a critical issue and I hope it will be addressed by those capable of understanding the implications of such a decision to the academia of A&M.

---

It was brought to my attention by a fellow classmate that you are looking to merge the College of Science. As a biology major, I'm hurt that the university would think of dismantling the College of Science. I take a certain amount of pride in being part of this college, and I do not appreciate you suggesting that the college be merged with another, especially liberal arts of all things. Biology majors have a certain reputation to uphold with professional schools and grad schools. Please don't tarnish it. You were saying that the majority of students and alumni were happy with how TAMU handled itself, so why are you trying to change things? Who cares about what other universities do? Please do not merge these colleges and do away with the college of science, which is a source of pride for many and a niche home.

---

Do not switch up the Biology department, that would be not ideal

---

I can see the viewpoint of combining the three colleges into one big college of arts and science but I do not agree that it should be done. Although it may "alleviate" some confusion and eliminates the long time process in changing majors, I believe having separate college gives it more designation and organization than just lumping everything together. It also does not make sense to put the department of Biology under AgriLife because many biology majors do not go into agricultural pathways but mostly research or medical pathway. In addition, many people prefer Biology because it more science based while biomedical sciences has more focus on social/health studies. I also personally believe that the Biology Department is not underperforming because the advising staff has been helpful for me from the very beginning.

---

The motivation behind wanting to combine the Colleges of Arts, Sciences, and Geosciences into one College of Arts and Sciences is well-founded, however very misguided. In an effort to build up and support students in smaller colleges, the proposition of "lumping" them together into one college would likely have the opposite effect. It strips away the uniqueness of each college, and raises similar concerns to centralized advising in which each student is no longer seen as an individual, but rather as a single number in a larger sum. The three colleges are largely different from one another, and merging them into one would cast aside these differences for the sake of being competitive with other universities. One of the main reasons for this proposition was that other Universities follow this model. Although it is noble to emulate other schools and continually strive to achieve greatness, Texas A&M University should not compromise the sake of its students in an effort to "fit in," or remain at the top. If you were to ask any average student if they thought a geophysics major and a liberal-arts major belonged in the same college of study, they would most likely respond that they did not. Each college is unique with different strengths and goals as to how to better society, and these differences should not be erased by grouping them together, but rather emphasized and celebrated. Merging the colleges could also put Alumni scholarship donations in jeopardy; many donors within each separate college gave funds specifically for the college in which they graduated, in order to see said college grow and new Aggies to continue down their career path. If the three colleges were combined, the individuals that they were originally built upon would no longer have as significant a meaning, and donors could potentially withdraw or halt their donations since they would no longer be going

towards benefitting their specific college, but rather be spread too thin across the newly "improved" second largest college in the University. These scholarship funds help Aggies pursue their dreams, and putting them at risk also puts the students that depend on them at risk. Overall, combining each college into one College of Arts and Sciences is comparable to throwing several endangered bird species into one enclosure at a zoo in an effort to raise awareness for them; despite all being at-risk, forcing the birds to share a space effectively ignores the fact that they all have different requirements and would thrive better in their own areas - ones in which they are given the individual attention they need to flourish rather than have drowned out their differences in an effort to bring them into the public eye. Just as you would not put penguins and parakeets in the same habitat, the three colleges should not be forced into a situation where their uniqueness is no longer celebrated, and made to seem even less significant when their titles are stripped away from them.

---

The Biology students do not want to be part of agriculture. Biology goes way beyond the scope of agriculture and most of the biology students are more interested in professional or graduate school than agriculture. Personally, I would not have chosen this university if the biology department was under the scope of agriculture, and I know that many of my bio major peers agree with me.

---

I am a Honors Biology student trying to earn a degree in Biology. Taking away the department of Biology and moving it to the agricultural department undermines my ability to get my degree. If I wanted a degree in agriculture I would have applied to earn a degree from the agricultural department. You are dismantling the department I belong to try and support agricultural which is vastly different from the department of Biology.

---

I am currently a student in the Biomedical Sciences program and find the integration with the Texas A&M College of Veterinary Medicine extremely helpful for my success. With the focused Biomedical science classes, such as anatomy, physiology, genetics, and directed electives taught by Vet School faculty, I feel extremely prepared for professional school. Additionally, this structure allows for a connected relationship between students and Vet School faculty, because the programs are specific for BIMS students and allow for smaller classroom sizes. For my first few years in college, many of the courses offered (such as CHEM 227) held a melting pot of students from a myriad of science majors. While I understand that this is a popular class and it was necessary, there were also many detriments that it caused. Many of my classmates were pursuing different paths, the sizes of the classroom were far too large to form deep relationships with professors, and there was little to no continuity among faculty between semesters. Starting my junior year, however, I began to have more classes at the Vet School through the specialized BIMS courses and directed electives. This is when I truly began to thrive in my classes. I started to learn things that were more aligned with my long-term career goals and a majority of my professors remained constant, allowing me to form deeper relationships with them. The BIMS program is what sets TAMU apart from other schools in Texas, and moving that program out of the Vet School would greatly devalue it. One of the major benefits of the BIMS program is the significant pre-professional development that comes through being taught by the Vet school faculty. Additionally, BIMS students are able to utilize state of the art classrooms and labs to complete their undergraduate education. I would strongly advise against combining the BIMS and Biology departments into an institute together and starting students on the same track. Biology and Biomedical sciences are vastly different in numerous ways and even though there is course overlap (like anatomy and genetics), having the specialized BIMS anatomy and genetics takes into account the aspects of human medicine rather than simply animals as in biology. Many professional schools see the BIMS department as unique and prestigious and therefore are more readily apt to accept graduating BIMS students into their programs. However, if the combination were to take place, I believe a lot of that prestige would become undervalued and students in the BIMS program would have a compromised chance of being accepted into professional schools.

---

Regarding recommendation 2, while it would be amazing to institute a college of visual and performing arts in Texas A&M, it would be a shame to change the Dance Science Kinesiology major that already exists. Texas A&M is one of only a few colleges in the United States that even offer a program such as that one, and it holds the position internationally as the best program of its kind. Putting the dance department under the new college would take away the opportunity for new students to pursue both dance and science in their undergraduate degrees. If students wish to pursue a fine arts degree in dance there are many universities in the U.S. that offer top tier programs and Texas A&M. would essentially be late in the game to making a name for itself in this area. We have already made a name for ourselves in the Dance Science area however and including the dance department under the College of Visual and Performing Arts would see this cease to exist.

---

I'm not against the merging of the college of liberal arts, geosciences, and science into one big college, as long as the departments maintain their normal autonomy. This is something that might make it easier for undergraduate students

to navigate and get core classes done. However when it comes to merging the Biology department and other biology programs across TAMU into the Institute of biology under the college of agriculture and life sciences, this is a terrible merger. I admit that this might seem good on the surface however there are many potential problems. Chiefly the current department of biology excelling in their field and bring a unique culture to it as well. The department as a whole fully supports their graduate students and is attracting new talent (nobel prize winning labs) due to their unique culture. To move this to an institute where things could get muddled up and potentially disrupt the culture has the possibility of killing the department as we know it. Moving the department to within the college of ag and life sciences seems to be a shallow analysis of what each area does. The Biology department and the Life sciences portion of AGLS do very dissimilar work and trying to merge them would create the opportunity for conflict. Moving the biology department into the "institute of biological sciences" would not be a beneficial move when it comes to research and graduates student care. An argument can be made that it is difficult to move between biology majors at this university. However, this is mostly due to the different requirements that each major has and the difference in the strength of each program. Biomedical science (BIMS) has a different end goal than those getting a degree in biology, and thus have different challenges in getting the degree. To merge them would remove any prestige you had in programs that joined the institute and have to start from scratch with a one degree fits all solution. Even first-year course requirements can differ, and this is what makes each program unique and special to the undergraduates. Overall merging the biology department and other life sciences would destroy the amazing culture of the biology department and any other department that joined the institute. This could then throw off the recruitment of talented and excited researchers who want that unique and diverse culture. Additionally, as a Ph.D student in the department of biology, we enjoy the autonomy and collaborative culture that we have here in the college of science as a full-fledged department, and have no interest in moving.

---

1. I would really like to see the data to support the claims you are making. As a member of the biology department I do not trust claims that are made with no data to support it. 2. I think combining the liberal arts with sciences is a huge mistake. Why would a liberal arts faculty member have any say over a scientific study. Furthermore the way our department is set up now works wonderfully with multiple levels of support for undergrad and grad students alike. Why would you tamper with something that works well. I know your whole agenda is to boost numbers, but quite frankly this merger will lower productivity reducing your percentages. There will be more hoops for researchers and PIs to jump through so less actual work can be done. 3. As it is there is very little duplication in experiments between BIOL and BIMS. Uniting these two departments seems counterproductive because not only will you have to reallocate resources but you will also affect campus structure since most of biology is on central campus and most of BIMS is on west campus. 4. The "Cornell Model" is a stand alone model that is not widely used or well used. It seems like following their model when 90% of other schools use our model or a similar model to ours, is also counterproductive. Overall, as a Masters thesis student in the Biology Department, I would like to keep the department the way it is now. I hope you take my opinion into consideration.

---

It is of my honest and most profound opinion that the realignment of the Construction Science Department from the College of Architecture would be a grave mistake, and would cause severe detriment to our universities standing in the construction industry. As well as, watering down the construction science degree and devaluing our education from a university that prides itself on such high and moral values. Relocating the department to the College of Engineering would change the degree program that is held in such a high standard in an incomprehensible way. A extreme number of our professors have come from the construction industry in some form or fashion. The knowledge that they bring to our education and our program cannot be understated. The ability to hear and learn from someone who has been in the industry for the majority of their lives can't be replaced by someone who has been in academia their entire career. Construction is not a knowledge base that can be gained just from solely sitting in a classroom your entire life. It is a knowledge that must be taught and learned from a true hands on experience. Our current professors allow us to have that knowledge before graduation. Doing so by preparing us for the life that we are about to lead. If realigned to the college of engineering our current, experienced, and knowledgeable professors would be out of a job because the college of engineering requires it's professors to hold a doctorate degree, which very few hold that distinction. The overall realignment of the Construction Science Department would be a grave mistake and would hurt not only the students education, but the university as a whole.

---

The intention is to combine the college of liberal arts and the college of science. I think this is a catastrophic idea as the 2 subjects are practically adjacent to one another in terms of relatability. To put all academic advisors under that umbrella would not serve the student body most efficiently as they would have to juggle classes and degree plans that have nothing to do with one another. I think it would degrade the widely esteemed college of science by placing it alongside

liberal arts. Liberal arts is focused on self expression, conversation and relative truth while the college of science is focused on seeking ultimate truth. It would not make sense to place them under the same umbrella, if anything place the college of science with engineering, at least another stem college.

---

Do not combine the College of Science and Liberal Arts and Geosciences. All of the colleges involved would suffer from this realignment. It would be a great disservice to the students as there would be SIGNIFICANTLY decreased resources (which are already somewhat lacking) and even more difficulty in communication and undergraduate students would not get the support they need to be successful. Especially in the College of Science and the College of Geosciences, combining with Liberal Arts would be harmful, which is only emphasized by further resolutions. They would need to share funding and would likely decrease the quality of professors in ALL departments. While I understand that ,this advocacy would add value in recruiting faculty in the arts, humanities, and social sciences which are often underrepresented at STEM-focused universities. This should not be at the cost of the stem fields. Additionally, cost-savings are listed. By saving money through combining the administration of the colleges, student success is likely to be blocked by extensive bureaucratic processes that keep the administration even further from the student perspective than they already are. This university, while it does significant research, should ultimately be focused ON THE STUDENTS. That the purpose of this institution and it should be fulfilled to the highest extent. Finally, do not compare these colleges to other university models or even the College of Engineering. The whole point of Texas A&M is that it stands out and is different in its field. By comparing it to other universities, we are undermining how successful TAMU has been thus far in its mission of education with the colleges separated. Also, the College of Engineering is a significantly different situation. Many students outside of the College of Engineering view it as this large, "untouchable" college that the university prides itself on. This is already a frustrating experience that would only be furthered by trying to combine the colleges because it would appear to be another large industry building college rather than one that truly cares for its students and helps them succeed. I feel very strongly that TAMU will lose its reputation as a good university for all majors if this change is made. Not only will it harm the university, but also the students it vows to educate. The combination of departments covering similar material (such as the proposed BIMS and Biology merger) makes much more sense. However the previously mentioned colleges do not even have too much in common. STEM versus liberal arts should not be combined.

---

First I would like to make the observation that none of the data used to reach the conclusions of the report are available for analysis. The reports findings are exceedingly vague. I am concerned about observations the report makes of the biology department such as, "splitting the program between three colleges creates confusion for students about appropriate majors and creates barriers to changing majors which results in increased time to graduation." I personally was a biology major in undergrad here at Texas A&M and am a current microbiology graduate student. I have never encountered any perceived confusion about appropriate majors or issues with major changes from any of my peers as a result of the diverse aspect of the biology department. I would suggest this diversity is a strength and that it allows for collaboration in departments that might not happen if the suggested realignments occur. There was also a line in the report that stated that "based on comments during the interviews, there is a perception that the current Department of Biology is underperforming and there would need to be a significant investment to bring the productivity to an acceptable level." I can whole heartedly say that whoever was interviewed for this report was either simply very very wrong or had some non transparent reason for making that statement. The biology department is, without any doubt, perceived as thriving both within the university and without. I likely wouldn't have even come to A&M for my undergraduate degree if that was not the case. Not only is it extremely financially supported but this department produces amazing and passionate scientists that are influenced and supported by the department's unique culture. Overall the reports criticisms of the department were either just untrue or actually the department's strengths. Creating upheaval in a growing and thriving department seems ill advised and would most likely yield results that reflect poorly on the university and the administration that caused the change.

---

I think option 2 is better because science and liberal arts have nothing to do with each other and one of the reasons I chose microbiology over vet schools and other college was the independency that the science department showed compared to other colleges and the high success rates.

---

I think the colleges should stay as they are to avoid confusion during applications and to allow easier divides between which colleges produce which majors

---

Overall, I could not disagree more with the decision to move the department of construction science to the college of engineering. The biggest reason for this would be the loss of our ACCE accreditation, which every top construction program in the country must adhere to. Without this accreditation, our program would be worthless. Secondly, we are

in no way, shape, or form, engineers. These are two completely different fields. Trying to incorporate engineering courses into a COSC degree plan would be absolutely pointless, as we are not engineers. This would be equivalent to comparing pharmacists to surgeons, they are two completely different fields. After all, if any of us wanted to be engineers, we would be in Zachry, not Langford. While the report does not explicitly state that COSC will be dissolved into another or new degree, we all know that this is the end goal. If TAMU attempts to incorporate the current COSC degree plan into a new degree, such as construction management or architectural engineering, it will undoubtedly fail miserably. These degrees and the courses they require are worthless, as they do not teach students how to build, but how to design and manage. To outsiders these concepts may seem similar, but to an experienced construction professional, they could not be more different from each other. This is why degrees such as construction management, architectural engineering, and construction engineering have some of the lowest employment rates out of college than any other degree, while here in the COSC department we boast an outstanding 97% employment rate. I would encourage anybody wielding any influence on this decision to attend a COSC career fair. Companies around the nation are hiring as many TAMU COSC graduates as fast as they can. Employers know that we have the top program in the country, as do I, and I would hate to see that changed.

---

I think it is wrong to move the Department of Construction Science to the College of Engineering. For one, the Department of COSC is renowned throughout the country and produces great constructors and project managers yearly. Also, we have had a symbiotic relationship working with the College of Architecture thus far. Thirdly, our department has some of the best Construction Science professors in the industry. Our professors have decades of industry experience and have provided the students with this knowledge since they have been here. Considering the points provided, I disagree with the proposed realignment of COSC into the College of Engineering. [REDACTED]

---

Please do not combine liberal arts with geosciences as this will take lots of funding from both majors. This is absolutely ridiculous.

---

I am a graduate student in the Biology department and I feel very supported in this department and it's current structure. My perception of the department has been that it is extremely successful at generating funding and performing ground-breaking research that contributes to numerous fields in biology. Part of why I chose to attend Texas A&M was because the Biology department is it's own separate entity, just like 149 of the 150 other top universities in the US. This gives the department autonomy needed to manage its own personnel and resources, which is what I believe makes it such an effective organization.

---

Please do not consolidate the college of geosciences, sciences, and arts. Those are polar opposites and do not belong together. The budget for the 2 schools have different needs that won't be met if they are combined. The value of a sciences degree will plummet and the products of hard working people from this university will not be at the same standards. It is truly heartbreaking to find out that after I transfer to this university that they are getting rid of the college of geosciences.

---

I believe that construction science should remain in the college of architecture and not be moved into the school of engineering. The main reason I do not want the move is because of the professors. If COSC will be moved to engineering, we will not have the quality professors that we would have now. The current professors for COSC are highly trained and experienced in the construction field and all worked previously in the industry before becoming a professor. If we were to move to the college of engineering, all the current professors for COSC will not be allowed to teach as not all of them do not have the credentials to teach in the college of engineering. The professors that will be teaching to us will not have the experience and knowledge about the real world industry that the current professors. I believe that this switch would not benefit the COSC program and would hurt it. There is a reason that the COSC program is one of the top ranked programs in the country, as well as one of the only accreted construction programs in the country. The current professors use their real world experience to prepare us for what will actually be happening when we graduate and move into the industry. Also, if COSC does move into engineering, the program might lose its credibility and no longer be one of the top ranked programs in the country. The history of this program is too deep and has such a positive reputation in the construction industry that a large move like this will have such a large impact that the program will never be the same. It will affect the aggie job market, internships, our reputation, and every other part of the construction industry. A move like this will effect the program forever, but keeping COSC where it is and preserving the tradition and reputation will be the best option for the school and university as a whole.

---

The Construction Science program is a program that has some element of Engineering but will not thrive in the college of engineering due to the fact of the students in the Construction Science program being more of in the field type of construction and the way that we learn how the projects are built and ran through out the design and construction

phases. The construction managers that come from this program have the experience that is needed to run a job completely from the start and have learned this from the program.

---

I DO NOT think the College of Liberal Arts should be combined with the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. The College of Liberal Arts already has an immense amount of majors/minors under the LA umbrella. It doesn't need to be combined with other schools — this will just make things more confusing for incoming students. Liberal Arts also has nothing to do with Science & Geoscience. This is a ridiculous combination of schools that truth be told makes no sense. There is no need for a “four-legged structure” that lumps LA in with Sciences, Engineering, AgriLife, and Texas A&M Health. Liberal Arts is purposely NOT STEM based. Do not try to make it so. This absolutely makes no sense.

---

I would like to start by saying that tamu founded the very first undergraduate dance science program in the US. I, along with the majority of my peers in this program, only came to A&M for this specific degree. It is the combination of kinesiology and STEM with the artistic aspect of dance that makes this degree so unique and important. Personally, I love the flexibility this gives us going into our working careers: we can diverge down many different tracts, and if we decide to go into performing there is automatically a solid backup plan built into our artistic undergrad degree. I love that there is a push to support the arts, as they are often forgotten about in favor of science and engineering here, but the separation of dance from kinesiology would completely change our degree. I understand that this will not affect me personally or my class year, but I have the utmost respect for the dance science professors who have put their life into making this major not only possible, but exceptional. Forcing them away from kinesiology would make the most sense only if the degree was changed to a BS in Dance Science and not simply a BA or BFA in Dance.

---

While the reasoning behind moving the Health and Kinesiology out of the College of Education and Human Development and into the School of Public Health and moving the Dance department into a new Performing and Visual Arts department makes sense on the surface, it completely disregards the fact that the dance department exists at a unique juncture of the arts and kinesiology. I've been involved in the dance program since my freshman year as a dance minor and know how integral kinesiology is to the the Dance Science major. This program is one of few in the country that aims to teach students to teach and practice dance in a way that is safe for dancer's bodies and limits the number of injuries by applying kinesiology to dance. Many students join the Dance Science major because it gives them the opportunity to continue dancing in college while meeting all of the prerequisites for Physical Therapy school. The way the report discusses academic realignment doesn't seem to acknowledge the vital connection between the dance and health and kinesiology departments and the suggestion to completely separate dance and kinesiology appears to reflect a complete lack of understanding of the dance program. How will this affect the dance department's intersection with kinesiology and was that ever considered during the proposal of departmental restructuring? An increased focus on the arts is important, necessary, and appreciated, but the dance department's connection to kinesiology is vital to the integrity of the program and must be acknowledged and respected by TAMU. Further, there is no connection between dance and theater in the current dance department, so the combination of these two disciplines seems like it would require a massive restructuring of the department. Just because other schools place their dance department in the liberal arts does not mean TAMU should. Other schools do not have kinesiology centered dance departments, so their dance programs don't need a departmental connection to health and kinesiology, but the TAMU dance program does. I would advise TAMU to consider how vital the dance program's relationship to health and kinesiology is and rethink how the university's academic realignment plan will impact the integrity of the Dance Science major.

---

As a current student, I believe the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science is integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

I feel that you're going to ruin the allure and prowess of Construction Science just in the name of improving the Architecture degree. Maybe I misunderstood the report, but to axe Construction Science and rebrand the department just to help out another great program seems like you gain one problem while trying to solve another. Unless Construction Science is kept the same, at least the classes crucial to construction as Dr. Suermann may vouch for. But I don't like the "rebranding idea" as Construction Science is an amazing program right now with most if not all students graduating with a job.

As a current Construction Science major, I can say that moving our department under the college of engineering would completely diminish the amount of work that countless people have contributed to. Construction science can not just be merged under the engineering umbrella as it would take away from the differentiation between the two. It is unfair to the many students who have pursued this degree. If you are wanting to do anything then make construction science as it's own college and expand from there. This department is nationally distinguished and sets graduates up for the future because many companies look to Texas A&M specifically for their tremendous construction program. There would be no distinguishing factor of the program if moved under the engineering college. I am extremely upset as an upcoming graduate, and feel that mine and others hard work is being overlooked.

All USAR majors should stay within the College of Architecture. I do not think it would be beneficial to be moved and the curriculum best fits this current college. Please do not make this change.

Rationale #9c. Howdy, this is my first semester here at TAMU, and I have loved it so far. I enjoy my major and the college itself. I read the MGT Report and paid particular attention to the section concerning my major, Construction Science. I understand the concern to compete and raise A&M's Architecture ranking higher than the top 25. However, I'm afraid I disagree with the recommendation to remove majors from the College of Architecture. When I applied to TAMU, I applied to the College of Architecture for construction science because of personal choice and the influence of family/mentors. Now many of my classes so far have been architecturally based, and I enjoy them. I did not apply to become an engineer at A&M. I know that the program is highly successful, but it is not my desire. Moving the Construction Science department to a different college would disrupt 75 years of incredible work and take away interest from the department itself. I also believe that it is unfair for me or any of my classmates to be transferred into the college of engineering to obtain the degree I desire. If this recommendation must go into effect, the administration should allow current Construction Science students to finish their degree through the college of architecture as anticipated when they were admitted. A great saying is: don't fix what ain't broke, and I think that is an excellent application to what is being presented here. [REDACTED]

I do not believe that there is a purpose for moving the Department of Construction Science into the College of Engineering. Texas A&M's Construction Science program has been nationally ranked in the top twenty due to their successes that have stemmed from the degree plan required by the department. Shifting the Construction Science program out of the College of Architecture will not only drastically change the departments nationally recognized reputation, but will also set many students astray within their college career. Students majoring in Construction Science have planned their life timeline and goals according to the degree plan set forth by the College of Architecture when they were admitted to Texas A&M. Changing a students pathway would lead to higher failure rates, due to the fact that students have not completed pre-requisites to specific classes that are only required in the College of Engineering.

Graduate-level instructors (faculty) are not interested in teaching and the quality of graduate level instruction in the department of chemistry is poor.

I am a graduate student in the college of science. I don't think I support combining the colleges right away because liberal arts and the sciences are very different, and if the new heads of the college are, for example, from liberal arts, I don't think they'd understand what it is like to be a science student

The rationale for combining the college of liberal arts and science seems like a poor argument and one that looks to only better the university and not the students themselves. I am currently A 3+2 student at the Bush School of Government and Public Service with my undergrad in the political science department and I do not agree with the proposed merger. I do agree that more investment and higher promotion of the Bush School should occur, due to the level of academic rigor and prestige that the Bush School and its students possess. I do not agree with the merging of the Poli Sci department and the Bush School. What makes the Bush School so unique and such a draw to students not from Texas A&M is the small size of our program. The lower amount of students makes the admission more competitive therefore making the program more competitive. The small student body allows for closer more personal contact with professors, career services, other classmates, and allows opportunities for students that I do not believe would be possible with a much larger program. I also believe that adding undergraduate students and would make the program less appealing to students that did not complete undergrad at Texas A&M. Graduate school includes a more serious, more dedicated group of students than undergraduate courses usually entail. The Bush School also has very specific course track and train up students and very specific courses that I believe overall would bring limitations to undergrads. I also do not want to see a faculty decrease at the Bush school, when our faculty who appear to be vetted differently than undergraduate faculty, are what make our program so amazing. I overall believe as a student who was in the Political Science department and is a current Bush school student that combing the programs would cheapen the Bush School

rather than elevate it as a program.

---

Rationale #9c. On the topic of relocating the Construction Science degree to the college of Engineering, I do not believe that this idea is the correct choice. The words are used as having "significant connections between..." various engineering programs. In my experience on internships and now accepting a job offer, construction science majors deal more closely with business men and architects than we ever do with engineers. We are taught to follow a job description of interpreting the drawings that came from the architects and to then add business to it to construct a building. Very rarely do I have to involve an engineer but rather I deal with the architects of a project every day. We should learn closely with those that our job is most directly impacted and altered by. As a project manager your job is not always to know how to structurally load a beam, it is however our job to know where that beam was designed to go and how we are going to get it there that is derived from plans by the architect and systems of the construction team. I do not think that adding construction science to the college of engineering will be beneficial to future construction science scholars but rather detrimental to the proper knowledge of the industry that we are currently receiving as being under the college of architecture.

---

It makes no sense. During my internship, a required part of my degree plan set by our department, I worked a contractor. I met with an engineer a grand total of zero times. However, I did meet with an architect almost weekly. The architect would meet with the engineer for his design aspects. Then come back to us with drawings and change orders. So to say that we align with civil engineering and mechanical engineering is quite honestly ignorant and naïve. From the students level, it seems as though this is a political decision to try and reach the (failed) goal of "25x25" which I believe has unbelievably negative feedback. Mainly because it pushes for quantity or quality. Having too many students means having to sacrifice in the quality of education. Teachers and TA's can't meet with all the students as they need to. I am in the Corps of Cadets, we had the same issue for two years. We changed to quality over quantity. Our Physical training improved and our GPA's rose over half a grade point.

---

TAMU is uniquely positioned to become the most valuable job-producing VFX/Animation/Gaming college in the country, perhaps the world. Our students and alumni permeate the industry, and the particular blend of artistic and scientific minds; whether they be mathematicians and programmers who happen to know a bit about the principles of animation and how to use lights properly, or painters who learn a bit about crafting tools to help them create, A&M Visualization is known well for creating some amazing professionals. However, it's also known within for having to make do with less, and our oversight by the college of Architecture (particularly their ITS department) means we have less autonomy and what works for them does not work for us. Recently the Viz department and students have been conflicting with the College of Architecture restrictions on building access. Animation often requires overnight lab access to maintain render queues and react to issues. This dedication is part of what makes us great, and restricting access entirely on Sunday was a mind boggling move, made clearly by individuals who have no perspective into our department whatsoever. The Viz department is already world renown, but whenever we bring individuals to visit they are always confused by our structure, confused by our parent college, and disappointed by our facilities. Internally, Viz (including Faculty) indicate that we only exist as a Rebel department; we lack funding and support, and yet produce top quality results anyways. It would be nice for us to self-determine, and not have the excuse for failing that we didn't have the computing power (for the Pipeline, this summer it was incredibly difficult to render because roughly 40% of the computers were so inferior they would lock up and freeze our renders. We had to engineer a solution to skip these computers and spend time and effort merely getting them to function as opposed to working on our projects), or didn't have the equipment (Our DSLR Cameras are frequently 100% rented out, and the equipment room does not have significant staff nor hours). Due to our budget shrinkage, we recently hired a group of Research candidates, let go of industry-oriented faculty, and hired a head of the department who seems highly focused on research funding. This makes a lot of sense if we continue to get less and less funding and are unable to acquire our own facilities, but the worry is that these individuals have little to no games or animation experience, and the money-centric focus will detriment student education; the industry experience is so key to our department that the Graduate students are frequently turning to mentors (Often upper classmen friends they made who recently graduated) from the industry for the maximum number of credit hours a directed study can achieve; relying on unpaid mentors is a risky proposition. The summer industry course likewise does so, which while it is an amazing experience, it is so at the direction of non-A&M personnel. Likewise graduate students teach an alarming amount of fundamentals courses and are given laissez faire on their syllabus. I should know, I taught three courses and felt overwhelmingly on my own. Contacting my department heads they'd sit and talk and help, our department has wonderful people, but there's just not enough resources. It took so much of my personal time I had to drop one of my

own courses, and eventually I decided the pay wasn't worth the effort anyways, it didn't offset how much longer my degree would take to be a full Instructor. My responsibilities were on par with full time faculty one semester and I worked 40 hours a week on that alone prior to my own work; but my tuition and fees were not paid by the position fully which is a typical benefit of being a working and teaching graduate student at other universities. As a grad student I've attempted to attend two courses; VR and Motion Capture, for three years now. They've been cancelled or too full and unable to take more students each and every time, and that's after adding additional seats the professor felt unsure they'd be able to handle. A refocus and retarget such as described in the report would be key in realigning Viz back on track before we become research only and lose the industry identity that we've worked hard for, and if a funding boost does not occur we will see diminishing returns; we already do now to an extent. Our mentors, even A&M Alumni, discuss how good programs are at SCAD now, or RIT, and have indicated their time is often better spent there as they do not have much to spare, and if they are having to fight with equipment or building rules or such, it isn't worth their time. As to the particulars of the report, I do think Viz being the flagship of a new college would be greatly in A&M's interests, bringing renown to the University and helping Aggies achieve their goals, go out into the world, and be successful.

---

Placing the Construction Science Department in the College of Engineering would be a disastrous decision that would change the entire dynamic of COSC and deplete the department of the men that make it so great.

---

I am a student in the Political Science Department. I love the idea of merging it under the Bush School of government. My feedback is that I would love that it be done soon enough so that my degree can reflect that it is with the Bush School rather than under the College of Liberal Arts. Thank you!

---

Recommendation #5 proposes to move the stand alone Department of Biology from the College of Science to the College of Agriculture in order to have a more united front for biological sciences. I am afraid that this move would drastically decrease the quality of the biological sciences program here. The stand alone Department of biology has been amazing to undergraduates like myself, with engaging professors and amazing research opportunities. It is because of our extraordinary stand alone Department of Biology that I passed up other high achieving biology programs, like that of Johns Hopkins, to attend Texas A&M instead. I know this sentiment is shared with my peers as I have engaged with undergraduate and post-graduate students alike, and many of them would have not attended Texas A&M if the biology department was a part of the College of Agriculture. A unified biological sciences program is a good idea, but it would be much more beneficial to the students, faculty, and University as a whole for this unification to occur under the already proven, stand alone Department of Biology.

---

Howdy, I am currently a student Environmental Studies major in the College of Geosciences. With the new academic realignment ideas, you are actively undermining the importance of the geosciences by placing the College of Geosciences into the College of Arts and Sciences, a college that does not focus on the Earth science courses I have had to take so far in my college career. One thing that drew me to the College of Geosciences was the fact that it is a smaller college; I have been grateful for its small community because I have been able to attend seminars, career fairs, and events and receive one on one interactions that will help me crucially in my future career. This realignment would take away all of that, every benefit I have received from my college would be gone. I came to TAMU to strictly receive a Bachelors in Science while taking my environmental courses, as many of my peers have as well. I would not have gone to TAMU for environmental science knowing it would end with me receiving a Bachelors of Arts.

---

The plan for combining the colleges of Liberal Arts and Science is awful, and I believe its enactment would lead to a major decline in the research and general capabilities of this university. There is no competition between degree difficulty for a liberal student as opposed to a STEM student, and combining these into a singular college insinuates equivocality. Combinations may save the university money, however staff employment, scientific discovery, and potential student interest in the university will suffer. Certain small but important majors are in clear danger should this plan be implemented, specifically the College of Geosciences but including others. This plan seeks to give more power to university heads (and remove it from individual colleges), and aligns every other college with that of the College of Engineering. This in itself is laughable, as said College is disgraceful in its handling of advising, academic assistance, and planning. Grandfathering of current students does not appear in the report, meaning that every major in the potentially-combined Colleges will be rebranded into this new disaster, and is sure to result in high backlash from students.

---

Again, the report fails to specify the sources of funding for proposed investments, mergers, departments, and institutes. Doesn't specify how general funding, grant funding, or research would be affected. Additionally, doesn't clearly specify the benefits of combining several large programs and university libraries into a singular, potentially overwhelmed College of Arts and Sciences.

Regarding moving Construction Science to the College of Engineering, I believe this would be a mistake. First, what makes our program as great is largely due to the industry professionals that teach the curriculum. Most of the best professors in COSC came from the industry. The experience and knowledge they bring from their professional experience is much more valuable than some professor who has multiple degrees but little professional experience. Not only that but the connections these professors and staff bring with them helps out the students so much. They are a huge reason why we consistently get 175+ construction companies each SEMESTER for our career fairs. Second, although we work closely with civil engineers and various types of other engineers in the industry, that doesn't change the fact that COSC is NOT engineering. There are some similarities with COSC and engineering, but at the same time there are some huge differences. With COSC, we deal more with the planning, budgeting, management of resources and labor, and safety of a construction project from beginning to end. With Engineering, they deal more with the design of how a construction project is to go about. Even though we work hand in hand with one another, COSC and Engineering serves more as a "checks and balances" kind of relationship. We check their design to see if it actually is buildable, whereas they check our builds to make sure we are following the design. Third, this point will kind of tie-in to the previous point I made. Like I mentioned previously, COSC is NOT engineering. With this being said, if COSC is moved into the College of Engineering, the amount of students who will be COSC majors will decrease dramatically. This will happen because every student would have to go through the general engineering for their first couple of semesters before they could apply for COSC. For many people, that alone could influence them to study something else or go to a different school where they can start their COSC coursework earlier and without as many barriers. In an industry that is always hiring and needing people to work for them, this could cause companies who sought out A&M graduates to look somewhere else because we will not be putting as many people through the program. I start working full-time in January and I have had about 12 months of experience in the industry already before graduation. The coursework I've taken has helped prepared me for the industry greatly. If most of the curriculum was changed to take engineering courses, I would not of been nearly as prepared and confident while I was doing my internships. This is largely to do with the work we do in the industry, is NOT engineering. These companies that come to hire us are wanting to hire builders, NOT ENGINEERS. Fourth, the report mentioned that our COSC program is already regarded as one of the best in the nation. Why would we re-invent the wheel? What we have been doing for years in COSC is obviously working to the point where other colleges are trying to replicate our program. With all of this being said, I understand the desire to start focusing more on architecture. The College of Architecture is the smallest College here at A&M, with COSC being the largest department within the COA. I think what should happen is Construction Science becoming their own College (College of Construction). I understand that this may be a difficult process to do, however I think it's very important to keep COSC and Engineering separate because they are different. This would allow COSC to keep similar curriculum without making students go through general engineering, and in turn encourage prospective students to pursue Construction Science. If you change COSC curriculum to take more engineering courses, then what would be the difference between COSC, CVEN, or AREN? Again, I believe that if the University wants to focus more on Architecture and thinks that moving COSC would help with that goal, then we should form a College of Construction rather than integrating us in the College of Engineering. Thank you for allowing us to give our feedback and I would be more than happy to meet with anyone about these proposed changes.

I have a lot to say about this topic. I am a senior construction science major and I can tell you that moving the construction science program to the college of engineering is a terrible idea. I will list my reasons below. My first reason for this is because a large portion of construction science majors are transfer students. I myself am one, and if construction science were in the college of engineering then I would not be here. It would make it very difficult to get the right students into the program unless admissions are revamped. Second, construction science is catered towards contractors and the physical building of structures, not design. Engineering is considered design in construction. Contractors and engineers do not think or interact in the same manner. Putting the program in engineering will make it where the right students will not be in the program. Third, it is not necessary for people who will be entering the contracting world to take advanced level engineering math and sciences. Contractors deal more with the business side of things, so it makes more sense for us to take business math courses and accounting based courses rather than advanced calculus that will not be applied in our careers. Building on the previous paragraph, the construction science program is already an ACCE accredited program. If the program were to move then we would lose this accreditation. We would have to start the process of becoming ACBE accredited which would require restructuring of our degree to be engineering based. Adding to the curriculum part of this, the full semester internship is critical to the program. Moving to the college of engineering would most likely get rid of this internship. While on this internship, students learn an

immense amount about the construction industry because we are fully emerged in it for several months. Fourth, the faculty in the program would probably change. The professors in the program have years and years of industry experience that is incredibly valuable. We can only learn so much in the classroom. Most of the learning we get helps us have a good foundation for when we enter the field. And it has to be taught by people who have been in and understand the means and methods of the construction industry. Many of our professors only have bachelors degree, but their experience is what is truly valuable. It scares me to hear about a move to engineering because I fear that the faculty will change from experienced and qualified faculty to whoever has the most education. The construction science program is consistently in the running for the best construction program in the country. I fear that moving to the college of engineering will significantly alter a program that has proven to be successful for many years. it has produced thousands of leaders in the construction industry. I hate to say this, but I think moving the program to the college of engineering will be the death of the program. Many of the current students and alumni that I work with feel the same way.

---

Howdy, [REDACTED], and I am a member of the Aggie Class of 2024. I am also a proud student in the Construction Science Department. I would like to provide my feedback in this report about the proposed changes that have been discussed in the MGT report. When thinking about the proposed move of the Department of Construction Science I had a lot of questions as I know several of my classmates had. Would Construction Science become an engineering tract, would we be able to keep all our professors (including those without PhDs), would our head of department change? My classmates and I have been discussing our thoughts on the report circulating back to these and other questions. When I first opened the MGT report and started reading about the changes proposed to Construction Science I was shocked to see how little of the article was dedicated to supporting the conclusions drawn. I was also shocked to see how many students were listed as respondents in the first pages of the report. Out of 500,000 people, only roughly 1,000 students had a voice in this report. Furthermore, I do not know of one Construction Science student who was interview in the preliminary survey. How can this be? When thinking about this topic, I thought about what it means to be a student at Texas A&M. I thought of our core values: Respect, Excellence, Leadership, Loyalty, Integrity, and Selfless Service. How does this report fulfill any of these values for COSC students? I have felt betrayed over the last few days with the lack of information and transparency that has been afforded to my classmates and myself. We are proud to be Aggie students. We are proud to be in our department. I came to A&M not to blow off and waste four years of my life, but because I wanted to do something with my life. Construction Science has thus far exceeded my wishes in all ways pertinent to my desire to be a Contractor. I have felt the value of my education in ways I know other students at different Universities and Colleges know nothing of. I have seen the application of my skills readily in my life, and I have grown to appreciate even more than ever the Aggie network and its spirit. How does the proposed move value the Leadership exhibited by professors who might lose their jobs if the change happens? How does the change exhibit Loyalty to students who might find themselves in a forced change of major after working for years for their degree? How does this move value Selfless Service to the students of the Construction Science program who came to Texas A&M expecting to receive what was offered from the program? And how does this move represent Integrity when many students have voiced the concern that COSC numbers are simply needed for the Engineering program 25 by 2025? "The primary mission of the Department of Construction Science is to prepare students for successful careers and future leadership roles in construction and construction-related industries." I have seen this mission at work in my own education while here at Texas A&M. "In our department, we treat students like family." I have been thoroughly pleased with the Department of Construction Science and the skills I have been taught thus far. The program has aimed to prepare me for the workforce and to exemplify the Aggie Core Values. It is true that the program is equal to none. The sheer size of companies who are so readily willing to hire Aggie Construction Science students reinforces this point. I mean no disrespect to engineers or the College of Engineering, but the parts that have been so far the least helpful for the development of my skill set have been those classes in my major that most resemble engineering classes. That is not what my classmates and I came here to learn. The report said, "Moving the Department of Construction Science to the College of Engineering will enhance the educational experience and research potential for faculty and students in both organizations." I, personally, and a large portion of Construction Science students cannot see that being the case. Please take this into serious consideration. Thank you.

---

I think it would be a total mistake for the Bush School to merge with the Political Science department. Furthermore, it would also be a mistake to add undergraduate and PhD programs to the Bush School. What makes the Bush School unique and competitive is the fact that it is entirely a master's degree program of students who mainly want to into public service. Thus, if the school is merged and/or programs added, it will dilute the strengths and unique qualities of

the Bush School. Overall, I am entirely AGAINST the recommendations for the Bush School put into the report.

On moving the Technology Management Degree program. As a technology management major myself I believe moving the program to the college of engineering will kill the program, most of the students in the program are there because they either didn't want to be or couldn't be in engineering, also Technology Management focuses less on the building and development of new technology and more on the implementation and training of technology within a business, this is what gives it a close tie with HRD. With regards to adding Music majors to A&M, I believe it would be a mistake. As a member of TAMU ensembles for the past 3+ years one of the things that makes them unique is that everyone is choosing to be there, not because they are forced to be there to satisfy a degree requirement. Also at many schools anyone pursuing a major that has to do with wind instrumental music is required to join that school's marching band. There is no way that TAMU could do this without losing the support of many Ol' Ags, because adding those students to the Aggie Band would be taking away from its value because you would not be able to make them all join the Corps

I am fully on board with the Academic Realignment Recommendation #2 as it relates to the Department of Visualization.

-- brief background:

In my time here at Texas A&M, I have learned a lot about professional development and truly want to see this department, and university, become the best that it can be! Navigating the differences of a state university and private university has been quite a challenge. I learned recently that state universities don't often look at private universities for comparison of similar programs because it is not seen as something to compare with. I disagree. I could go into many details, but I think my perspective can be summed up in the following statement: "I want to see the Visualization Program at Texas A&M University become the best program in the nation, period." Yes this program might be the best program among other state universities, but it is falling behind in comparison to other programs of a similar nature in this country. -- The above may sound a little hopeless, but this program has a lot of potential! I truly believe that this recommendation listed in the MGT Report gives even more hope to make this program one of the best in the nation! Period. STEAM vs STEM, I would choose STEAM any day. The Arts has a way of stretching the mind, and forcing students to think backwards, which is exactly what engineering is all about. The Visualization program has a great mix of technical and artistic combination to teach the next generation, and prepare them for the future of work. I often tell my students this analogy: "If you take a glass of water and tip it over, what are you doing? The students usually reply with 'emptying the glass of water,' which my response is 'yes, but the physicist will tell you, that you are actually filling the glass with air.'" This is the analogy I tell my students to introduce the idea of backwards thinking. Creative solutions sometimes require you to look at a problem from a slightly different angle. Sometimes we have to break something even more before we can fix it! I watch my students over the course of a semester, or two if they take my 'Building the 3D Character' course, drastically change how they think and approach problems. Sometimes I give students an unsolvable problem, to see how they handle pressure and a challenge. Towards the beginning of the course, they don't handle it too well, but by the end are able to present solutions that I had not even considered. I see a tremendous amount of value in the arts program and fully support the idea of forming a new college to combine the resources of the department of Performance Studies, lead by the visualization department. The three main areas within the visualization department are Animation, Gaming, and Virtual Reality/ Augmented Reality. Having a closer connection with programs such as Music, Theater, and Dance will enhance the collaborations of projects among students and faculty; projects like motion capture on a Dance performance student dancing along to music composed by a Music student. We have the opportunity, to become one of the nations leading technologists and researchers in VR/AR, gaming technology, and animation. -- Lastly, if this consolidation and combination does take place in the next few years, this new school could greatly benefit from a new building. One that has a film studio, recording studio, equipment cage and loading dock, professional cinema grade theater (I have connections with Dolby and IMAX), VR/AR, and motion capture research labs. A building similar to the one recently built at RIT, the MAGIC SPELL STUDIOS building would be a great one to look at for ideas. This program, at the best university, deserves a state of the art building. This building could be a game changing element in convincing students from all around the world to choose Texas A&M University.

I do not think that combining the College of Science, College of Geoscience, and the College of Liberal Arts is the best move for the university. My main concern about this transition would be if science majors would now be considered social sciences. I know many companies such as NASA do not except social sciences as a true science background. I don't understand the connection of how someone studying chemistry and environmental geoscience could relate to someone

studying Spanish or performance studies. I could understand the combination of the college of geoscience and the college of science however I believe there is a need to keep the College of Liberal arts separate. Evl could understand the combination of the College of Geoscience and the College of Science. However, I believe there is a need to keep the College of Liberal arts separate even if it would save money and some other universities have this combination to save on cost. It just does not seem logical and there is a lot of concern amongst many science and geoscience students for their concern that their degree might now become a social science.

---

I believe that the college of architecture should be left as is. As stated, it is an extremely successful college. This college brings a lot of diversity, allowing for a lot of new ideas to grow. I think that construction science, although has ties with engineering, belongs with the school of architecture because the two concepts go hand in hand. As stated again, the construction science program is extremely high ranked and moving it to the school of engineering may decrease the amount of student who chose to pursue this program.

---

As a student in the College of Geoscience, I have to express my concerns with the alignment of our college with the College of Liberal Arts. Combining the College of Geoscience is not the way to make Liberal Arts a bigger college; it will result with the geosciences being swept under the rug in an attempt to make the arts more popular. In a smaller college like the Geosciences, it is easier to connect with people of the same major and have connections with professors that you may have for multiple different classes. The College of Geosciences also has opportunities to host events for the whole college, including social, professional development, and community service events specifically for geoscience majors, and I think that would all be lost to this switch. The College of Geoscience will have little to no benefit from the switch and this was ignored in the report. The report solely focused on adding numbers to the Arts, it did not provide any information on the changes/benefits that would happen to the College of Geosciences. In addition, Liberal Arts will have very little gains from having our college combine with them. Not to mention, Geoscience is science based. The degrees in that college should be with science. Geosciences should be placed in their own college because its majors are completely unique and stand alone from anything else offered at the university. I personally have received great counseling and a great education from the College of Geoscience and do not know how aligning this college to make it non-existent will provide greater benefits. It is unique that A&M provides a bachelor of science for an Environmental Degrees and it stands us apart from other universities. Future geoscience Aggies, and current geoscience Aggies will be extremely disappointed in this switch and how there will not be a certain college to represent environmental degrees with the increasing need for them in our society today. In addition, I do not think any of the students in the College of Geoscience care about being a small college, nor ever thinks about it. We all chose our degrees in the College of Geoscience in the first place knowing it was a small college, and I 100% believe I have benefited because it is so. The College of Geoscience should continue to stand on its own and students who have started our degree programs should be able to finish with a Bachelor of Science not a Bachelor of Arts.

---

Recommendation #1 for merging Liberal Arts, Geosciences, and Science seems logical and practical from an administrative viewpoint, but as a student I have to disagree. Many goals and purposes that drive the university are the students, but from a student perspective, I struggle to see the benefits to us. More resources and more money are two solid reasons on the outside, but is this really a good idea that will benefit everyone in each college (liberal arts, geosciences, science)? It appears the school benefits more than the people. I think the drawbacks carry more weight. I see this recommendation is a common trend at other large universities across the nation, but I believe in the core value at A&M of leadership, and believe A&M leads in the uniqueness of having each of its colleges being independent of each other, and especially the College of Geosciences. For meteorology, we are the only school that offers the degree at the undergraduate level and have one of the top programs in the nation, and Texas A&M and the College of Geosciences get to take credit for that. Merging these colleges would take away from the uniqueness of academics at A&M. Secondly, each college has their own purpose and goals. Liberal Arts and Science have different purposes, so I think merging the two would redefine the purpose of each college, and risk the competitive nature of our programs. Geoscience is also one of the only colleges that goes into the field to do research. Geoscience and Science majors would be underrepresented and marketed because we'd fall under a larger system, and I fear our programs being overlooked by many. Are we still the school of geosciences after we merge, or do we become just departments under the College of Arts and Science? On a different note, Geosciences also does a fantastic job of exploring social science. Our GIST degree is growing through the department of Geography because we see more employers look for GIS experience. One of our professors in the department of Geography does research on environmental justice in terms of water security. This is a small yet significant example of social science representation in the College of Geosciences. Next, I want to share how the College of Geosciences influenced my decision to come to A&M. I am a first generation student, but I had extended

family that came to A&M, so every time I visited before college I loved how welcoming and friendly the students were. The traditions that brought all Aggies together really made me feel like I was part of the school even before attending. The second half of my Aggie story is the College of Geosciences. Coming to one of the largest universities in the nation is a bit intimidating, and as a campus tour guide with the Howdy Crew, that is the biggest drawback I hear from prospective students and their parents. I can sympathize with these students because quite frankly, I felt that a little bit too, until I visited the College of Geosciences and met Judy Nunez. Many doors opened up in geosciences that assured this was the place for me. When I meet with a prospective student when recruiting for geosciences, I also hear from them that it is a little scary, but I get to share about how you can be known in the College of Geosciences by really getting to know faculty, professors, other students, graduate students, and even our dean. This change would bring less opportunity for students to know these individuals on a personal level when working with a larger system. We lose the community aspect for geosciences, and I'm sure sciences can also relate. For freshmen students in our college, does Dr. Thomas get to sign their diploma? Will they even meet their dean? These students anticipated a diploma saying College of Geosciences. I have been blessed with many opportunities in the College of Geosciences because I've been able to know faculty on a personal level. For example, after attending GeoX, I learned about the Geosciences LLC, where I got to live with others in geosciences who I took general classes with, like chemistry or calculus, and made relationships with other students who have the same ambitions as I do. When I participated in the LLC and attended GeoX, I got the awesome opportunity freshmen year to have lunch with the dean and CEO of EOG Resources because I made connections with those in geosciences. Doors kept on being opened for me, and next my RA of the LLC shared that there was a student employment job open with the Environmental Programs advisor. I applied and got it, where I still work today. Allison Harms has been a mentor for me the last 4 years, and she is a prime example of the advisor that everyone loves and thanks at the end of their 4 years because she knew them on a personal level, and supported them academically throughout college. After being involved with so much in the College of Geosciences and making so many connections, I was offered a position to be a peer mentor for the College of Geosciences and Judy and one of my professors actually mentioned my name to the director because they both knew who I was and my character. By merging colleges, I'm not sure the students would be offered the many opportunities I have had throughout my last 4 years. As a senior, I realize these changes will not impact me directly because I will be graduated, but I think about the job search process. A few years down the road when applying for jobs, I think having a degree that says College of Geosciences as opposed to College of Arts and Science makes the student a higher candidate for that particular job. In conclusion, I do not think these decisions happen overnight, and believe that implementing all academic structural changes is too much too soon to be done by next fall. The merging of these 3 colleges is not ideal, and would change all of academia at A&M.

---

I feel it's unfair to move majors out of the wonder college of architecture. We have worked hard to be here and should not be forced to move elsewhere.

---

Not only would this change my whole career path, but also changes my whole degree. Over the past 5+ years I've been working towards this degree to become a geologist. I transferred to Tamu to get further knowledge of environmental impact. I am a senior expect to graduate in fall 2022 and I do not think it's fair to change the whole title of my degree that I already put 90+ credit hours toward. If this change happens I will gladly transfer back to U of H to obtain the degree title I think I deserve as well the degree title the jobs I've been contacting expect me to have. Other students I have conversed with also said they would be transferring out as well! We are all very disappointed and hurt. Sometimes money shouldn't be the motive but the value of the student body you are effecting, this broke the spirit of many geoscientist, and is definitely passive aggressive.

---

Y'all should absolutely not move construction science to engineering. That is all

---

The construction science department SHOULD NOT be moved to the college of engineering. Although we do have more engineering type courses than architecture, that doesn't mean we should switch colleges. As contractors, project managers, and superintendents we need a basic knowledge of engineering and nothing more. It is not our job and the college of architecture allows the construction science department to possibly expend into the different sectors of construction.

---

I did not like the idea of realigning the different colleges on campus into 4 units!

---

I am a current first-year medical student. I disagree with rationale number 7 under recommendation #7. Our faculty are already short-staffed. In addition to teaching, they support us outside of the class room by holding review sessions,

creating extra videos, helping us in anatomy lab, and a host of other things. Pulling them away from the medical school to teach at the main campus would take away from the medical school. The better idea would be to hire more faculty for the main campus in the department of biology or other life science department.

On behalf of myself and my fellow College of Geoscience Aggies, we VEHEMENTLY DISAGREE with the proposal to merge the colleges of Science, geoscience, and liberal arts. "An Aggie does not lie, cheat, or steal nor tolerate those who do". On my honor as an Aggie, I hereby state that everything that follows lives up to the highest standards that is the aggie code of honor. I will be giving my honest opinion in a professional manner without fear of retaliation for said opinion.

Reason 1: The loss of something unique and special Even within the name, 'college of Science and Arts', the college of geoscience has been erased. The collaboration among the geoscience majors and partnership with IODP is something unique at A&M and unmatched elsewhere. Myself and my fellow Aggies can attest a major consideration point for attending A&M was the small college feel with large college resources. We get the benefit of smaller lecture classes, an intimate classroom setting where every professor and undergraduate student is familiar with each other, and a space unlike any other college here at A&M. A&M stands out because the college of Geoscience is its own entity. In your report, you often allude to the university of Michigan and Florida, but you did not make note that the most highly rated and competitive geoscience program (the Texas University Jackson School of Geoscience) has its own college. I can attest that without the special designation for the college of geoscience, my fellow Aggies and myself would have chosen elsewhere. We are a family in the college of geoscience. That family started day 1, semester 1 when we were all introduced to each other in our 'dinner course'. It was an evening class where we were given a free meal and were taught how to be successful here. We were shown and introduced to people and resources that have continued to help me and my fellow Ags throughout the years. If you lump the colleges together, how many sections of that class do you think would be necessary to fit everyone? I know all my friends from that one class – the entire department of geology and geophysics. My friends in other colleges don't know the people they sit next to in lecture.

Reason 2: The other colleges don't want the merger either The college of liberal arts is just that: Liberal arts. They have no more use being in a college geared towards STEM than we do being in a college geared towards liberal arts. If the goal is to diversity our coursework, a helpful suggestion might be to improve upon the already existing infrastructure without such a drastic change. We're all required to take certain CD/ICD credits. Introduce more of those or strengthen that program, not subtract from ours. But also understand, liberal arts majors chose that pathway because they do not want to do STEM based coursework. It simply does not make sense to house psychology, geology, and chemistry under the same umbrella. Highschool is for figuring out which pathways you like and dislike. College is the time to hunker down in your major specific coursework and be a part of an environment catered best towards helping you learn that. Merging these three existing colleges into one lump sum would be nothing short of devastating for the students.

Reason 3: The reallocation of funds The college of geoscience provides funding in the form of research and scholarships that is unmatched by any other college. Myself and my fellow geoscience Aggies rely on that funding to be able to attend college. "The college of geoscience has the most funding per student at any college here at A&M. They also have the most opportunities for undergraduate research of any college."- this is what tour guides tell prospective students looking to apply here. Now imagine a merger with 2 much larger colleges and the fear of many students, me included, that we will lose financial aid, resources, and research funding.

Conclusion: I urge you to please reconsider merging the college of geoscience, science, and liberal arts. Please read through our grievances and consider how the students are impacted. A&M is built on family and I don't want to lose mine.

I am in the construction science major and I do not think it would be beneficial to us if the department moved to the engineering college. It does not align with our values and I think as a student I need to be surrounded by those in the design field to better understand how to realize those designs in the future.

Recommendation #9b: As someone who completed my undergraduate degree in a University Studies program, being able to be in the College of Architecture for my degree was extremely important to me. In my opinion, moving University Studies degrees to the College of Arts & Sciences would be a big mistake. Texas A&M offers many University Studies degrees in their designated colleges and I think that gives students in these programs a sense of place and sense of belonging. Especially at such a large institution. I know for the College of Architecture at least, many students in the USAR program chose the program either for the flexibility or because they wanted to be in programs within the college that only accepted a set number of students. I fall into both categories, so being able to stay in the College of Architecture was extremely important to me. And yes, I understand that moving these degree programs into a different college would not change the courses students would be taking, but for many reasons, it is important for these programs to stay in their respective colleges. I believe a better approach would be simply renaming the University

Studies degrees to something like "Independent Studies in College of \_\_\_\_\_." This would better describe the degree programs since independent studies is essentially what the university studies degrees are, and also allow the programs to stay in their respective colleges. A key aspect of the Texas A&M environment is the community and having a sense of belonging. This sense of community and belonging starts in the classroom. Before students ever set foot on this campus, they already belong to a College and are welcomed into that community. For those choosing the University Studies route for their degree, it is vital that they, too, feel welcomed by the college they choose to focus their studies in. Recommendation #9c: This recommendation is actually really great. I think refocusing the College of Architecture will allow for better education in this College and ideally attract more professors and therefore allowing for a more diverse selection of courses to choose from. Going back to recommendation 9b, this refocus in the College of Architecture would also be incredibly important to USAR students and further solidify the reasoning for keeping USAR within the College. I graduated with my undergraduate degree in USAR and am now a graduate student in Urban Planning. I believe if this refocus had been done during my time in undergrad, I would have had a better understanding of Urban Planning and probably would have discovered the Urban Planning programs, both undergraduate and graduate, offered by Texas A&M earlier than I did. Additionally, I think keeping Construction Science in the College of Architecture would be wiser than moving it to the College of Engineering. There are components of both engineering and architecture in Construction Science, however, I feel this degree is better suited for the College of Architecture.

---

I think for Kinesiology - Dance Science, while more funding is definitely needed and the new building would be amazing so that we can have an actual stage, I do not believe the program should be moved to a fine arts BA program. If you asked anyone in the dance science program we would all say the same thing: Our professors have spent YEARS building up this program. What makes us unique compared to the hundreds of dance programs around the country is that we combine science and kinesiology with dance. We have people from all over the country who come specifically for this program because it is the only BS dance program in the country. I would be extremely disappointed if this major become a BA.

---

As a student in the College of Geosciences, I feel as though combining it into the Liberal Arts and Sciences would leave the College of Geosciences overlooked for many reasons. The College of Geosciences provides excellent research and opportunities for all. The topics and majors offered through this college are specific and correlate with other colleges and programs more than with Liberal Arts. If there's a combination of colleges, I feel that Geosciences should be left as it is and just the Liberal Arts and Science should be combined. That is because as I stated earlier, I feel it would get left out. I know for a fact that myself and others in Geoscience would straight up transfer Universities if this occurs. That is because the value of our work we're dedicated to would be de-valued. From just reading the document, I already saw and felt the overlooking of Geosciences. The addition of Liberal Arts and Science makes more sense than adding Geosciences. I can see the correlations between the two more than I can with the three. Finally, I would suggest continuing to re-evaluate your options. Merging Geoscience would cause it to lose its value. I really hope you don't do this. Honestly, no longer being nice with my statements, it's stupid to do that to save money. I've heard that you don't even want to fund our field research. If this occurs, I will transfer to a university who respects my line of work and study.

---

I honestly believe with all my heart and soul, all good things go through Texas A&M. Not to mention I am a first-generation Aggie, and the second member of my family to attend any institute of higher education. Being said, it is completely my own choice to attend this school. Therefore, the idea of academic realignment is completely absurd. It would be doing all current and future students a disservice and would be extremely disappointing by offering an educational upbringing that fails to align TAMU's Core values with the traditional values found in the written word. I totally think we are on the right track as a whole here, by asking ourselves as a University; in which ways could be better? Why make changes that are going to be timely, costly, and cumbersome on the student body? I personally would like to see changes regarding my specific department be geared towards GREEN BUILDING AND CONSTRUCTION SUSTAINABILITY MEANS AND METHODS. Not to pass judgment only but upon myself, based on what I have seen and heard it is vital this University safeguard those traditional values on which it was established.

---

This seems like a terrible idea. It won't help anything at all and will just make our college seem mediocre, making everything fit under 4 files will make us look cheap

---

The College of Geosciences has always been special because it's a close, tight-knit community. We are the college where students don't feel like a number, and the learning experience feels less business-like and more open to mentorship and collaboration. We are the college with all of the big-school resources with a small-school feel. The geosciences include subjects that range far and wide and use a variety of different skills. We don't fit neatly into any other group. Trying to merge our college with any other could prove incredibly detrimental to the value of my degree, student networking

across the geosciences (professor and student alike), and destroy our community.

---

The "College of Arts and Sciences" was a stretch when I first started reading it. I could understand the gesture. Then I read that the plan is to add the "University Studies" and "University Libraries" into the mix and that completely lost me. My College of Science degree value is going to absolutely PLUMET. College of Geoscience majors pay WAY more tuition than Liberal Arts majors and science-focused majors in general have much more rigorous course work. I've discussed this with numerous peers and we all HATE this idea. We've termed it the "Junk drawer" of the university plan because that's exactly what it is. We have more classes with engineers, BIMS, health and biochemistry majors than anything else. We aren't in any way connected to the university libraries and we definitely shouldn't be included in general studies. We worked hard to keep our GPAs up to keep ourselves in the distinguished College of Science and we refuse to be placed in this junk drawer of a plan. Please consider our concerns, tuition payment, and rigorous coursework. Thank you for your time.

---

The idea of the College of Arts and Sciences is cool and all. But, I do not agree with reassigning the University Studies degree (Recommendation #9a). Leaving the University Studies degree as is is better in my opinion because it helps the students to actually focus on being in a college/department that they want to major in. Being put under the College of Arts and Science may be too broad for students to focus on their major even though the University Studies degree allows the student to design their own degree plan. For example, I was in the University Studies Architecture program during my undergrad, being in the College of Architecture makes me feel connected to the architecture, design, and construction aspects of my degree and I really enjoyed that. It helps me focus on the fact that whatever I was studying is related to the college that I was in. If the University Studies degree is being moved all together to the College of Arts and Sciences, I don't think a lot of students would be interested in it because they think their program would only be related to arts and sciences rather than business or architecture like what the current degree offers. As for refocusing the College of Architecture on a core mission of Architecture and landscape architecture/urban planning (Recommendation #9c), REMOVING THE CONSTRUCTION SCIENCE DEPARTMENT IS A BIG NO. Removing the Viz department from the college is a no also. However, if creating a new School of Fine Arts for the department, I would support it. Back to the Department of Construction Science in which I am currently a Masters student in. I do not agree that there is a significant connection between my department and the department of mechanical engineering and engineering technology. Department of Civil Engineering... maybe yes. Moving the Department of Construction Science to the College of Engineering currently doesn't seem right to me. I would need a more detailed plan as to how this program would fit in with the College of Engineering without merging with the Civil Engineering Department. I believe that the Department is perfectly fine within the College of Architecture because architecture and construction relate to one another and being in the COA seem perfect enough for me. In addition to that, the Department of Construction Science is doing perfectly fine within the COA and does not need to be moved to the COE. Our department is big enough and is recognized as a top program within the construction industry, as is. No changes should be made in my opinion.

---

My opinion on this subject is as follows. If we are going to be following a model that the "more elite" schools use, we must do the same whenever it comes to the Department of Economics, and what I call the UPENN model where the Department is bifurcated into the BA side which is in the new Arts & Science college and the BS (of which I am a member) is added to the business school as the BS is objectively more rigorous than the BA because it's an Arts degree. In addition I would argue that the same should happen for the Masters of Science in Economics as well (I am also a member of this degree track) and all this should happen and be set before the Spring Semester of 2023. If President Banks has any questions she is more than welcome to reach out to me to discuss this issue; my number and email are both on file.

---

Howdy, I am a junior Construction Science major. After reading the extensive report, specifically the topic of the movement of Construction Science to the Engineering Department, I urge you to reconsider. The report denotes that Construction Science is vastly similar to Structural Engineering and Civil Engineering but I strongly disagree. The major difference between contractors and engineers is that we (as contractors) have nothing to do with design. We are specialists in understanding and transforming 2 or 3D documents into the real world through meticulous detail and integrity. If this switch to the Engineering Department is to happen, I would humbly recommend that the current Construction Science professors, remain to teach their perspective courses at Texas A&M University and the curriculum remain very similar. It is an honor getting to learn from these great men and women who have been in the industry for numerous years and understand the ins and outs very thoroughly. I am very proud knowing that I attend one of the greatest universities in the United States and in one of the only accredited construction programs in the states.

This will refer to the Department of Construction Science being moved to the College of Engineering. The Construction Science department was referred to as more similar to structural engineering than architecture. While I don't believe Construction Science is more related to the current College of Architecture, I do believe that we do not belong in the College of Engineering. Construction Science is greatly respected as well as an accredited degree program at Texas A&M University. We are taught to be the best contractors to come out of any university. Contractors are neither Engineers or Architects, simply because we are taught to design nothing. If the move is motivated simply by quotas that need to be filled I urge the administration to reconsider. At the very least, If the department is moved to Engineering, leave the professors as well as class content untouched. I have a deep appreciation for the department of Construction Science and the professors employed in it. It would be a mistake, to say the least, to dismantle everything Construction Science has become. Thank you for your time.

---

I feel that the combination of the Arts and Science schools is very detrimental to the success of STEM degrees. With this combination, it would undermine the student's degree and most likely force them to take irrelevant classes for their degree. The two schools have nothing in common, and is just a back alley way for saving costs. In doing this, you'd be ruining the reputation of both by having split funding and a dean that doesn't understand the complexities the individual degrees. Overall, a bad idea.

---

The recommendation to move the Visualization department into a College of Visual and Performing Arts is a great one and should be utilized.

---

I personally find a lot, if not all of this report dreadful. I understand that the college is run as a business, however, it comes to a point where these changes no longer care for the students and are just based upon profits for the school. This will not only impact student life but also decrease student retention drastically. I also believe that it is not right to get rid of the Geosciences, and architecture schools and just put them in liberal arts or engineering. I understand visualization moving to liberal arts, and many students in the department, I'm sure, want this change to happen. I also strongly disagree with the implementation of this in the University Studies majors specifically, making their degrees a bachelor on liberal arts and not science, regardless of the curriculum they had to follow. A lot of these changes, especially in the department of architecture from what I have seen, are not in the benefit of the students or their best interest. This school should pride itself in the quality of the education they provide and the value of the degree in the world as an A&M Graduate. These changes would definitely decrease the latter for USAR and many other architecture students. Establishing a department of journalism, investing in a museum and cultural centers would all be good for the school and benefit it in the long run, in terms of both infrastructure and student satisfaction, and because of this profits for the school. However, when changes come to the actual programs then students (current and prospective) might want to reconsider coming to Texas A&M depending on their major. This school of visual and performing arts being established would also be a benefit for a lot of people within the department of visualization, theater, and music.

---

I am a current Visualization student and I wholeheartedly support the idea of establishing a school of visual and performing arts and allowing Visualization to be its anchor. I believe this program has great potential to be something bigger, as the blend of arts and technology is quite unique to A&M, as well as its strong connections to the game and animation industry, which are factors that attracted me to coming to A&M. A limited number of faculty leads to very crowded classes, which I have experienced in some of my studios, which should be smaller due to the classroom size. It would also benefit many of us if there were more different viz classes offered because there were classes I have seen on older documents that I was interested in taking, but unfortunately no longer exist due to lack of instructors. It would also be nice to increase how many students they take in the major as I know it is a very selective process if a student does not qualify for the top 10% automatic admission. However, if this school does not go through, I would still suggest greater funding for the Viz program. I have heard many people being interested in the art and game design minor, but are not currently able to do so due to lack of funding. Students want to be interested in the arts but as of right now only Visualization students can fully experience what these classes have to offer.

---

The Department of Construction Science has thrived under the umbrella of the College of Architecture. Since 1946, the department has risen to become one of, if not the, top programs in the nation. The faculty currently employed by the department are without a doubt some of the top construction minds the industry has seen. By forcing the Department of Construction Science into the College of Engineering, a disservice is not only being done to Construction Science, but to the construction industry itself. Engineers do not understand construction contractors; the College of Engineering will try apply curriculum to Construction Science (or whatever it may be called) that will directly lead to the death of Construction Science at Texas A&M. The Construction Industry Advisory Council (CIAC) will pull all scholarship contributions from Texas A&M, leaving the majority of Construction Science students without financial aid to support

them in their journey to becoming professional contractors of integrity. The construction industry is one of the largest industries in the world, and produces more than 5% of our nation's Gross Domestic Product. Construction affects all of us, whether we like it or not. By allowing the university to go through with its plan of integrating Construction Science into Engineering, the university is removing any chance of Aggies using our incredible leadership to continue leading construction in the right direction. If something is not broke, don't fix it. If something is growing and thriving, support it.

From what I read the main reason to combine the colleges was to say that A&M focus on these 4 fields. "Arts and Sciences, Engineering, AgriLife, and Texas A&M Health" this looks amazing on paper but really doesn't change anything here on campus. all this does is discount an already discounted student body even more from the people who design our curriculum. one in my view is very messed up. I think 90% of students couldn't get to their colleges home page from howdy. when you type "college of architecture" into the howdy search bar the first thing it comes up with is how to buy the 500\$ + sport pass. for once please stop trying to make new problems and fix the ones you have first. the whole howdy page is bad. It is filled with problems and links that do not work and that lead you to the same page. use the money we pay you to make the students have a voice. there is a reason why college students have the highest rates of depression that are actually much higher than anyone who is not a student would know. I did not come here to A&M because they changed names and did not care about how each and every college is uniquely great at A&M. Each of those administrative teams for those colleges represent completely different things. these people need more help not less. what you are saying is that cost saving is more important than students being connected with the people who are controlling their study's.

Construction Science should stay under Architecture.

As a construction science major who is about to complete his Bachelor's degree, I am a little concerned with the moving of COSC to the College of Engineering (COE). I think Texas A&M has the best program currently for the Construction Science degree. I would be supportive of the change to the College of Engineering if and only if there are minimal changes to the current degree plan. I am almost graduating in this program and have worked on internships and feel that the current programs give much that will be asked once I have graduated. The current professors are hard but give you everything you need to be successful in their classes. What they have taught me in class has provided me the ability to go in day 1 on an internship and be a contributing part of the team. The only thing I would add is possibly a Project Manager class that is more focused for on the job site possibly like another required on the job site Project Manager internship. A student can learn so much from experiences they will have while on the actual job site.

I disagree that The College of Liberal Arts should be combined into a larger college when it's already pretty large as is. The students of this college have a lot of pride in being COLA students and changing that to add in two other colleges that don't have much to do with liberal arts will diminish the feeling of belonging and home to the students currently in COLA.

I do not like it.

I find it odd that there's such a push to merge arts and science together. Granted, I have no research or backing in this, but just because other universities do this doesn't mean we should, there should be more benefit than cutting back cost by reducing advising offices. Science and Geoscience very niche and fit nicely together, maybe with the inclusion of Computer Science, but lumping in Liberal Arts seems a bit too out of left field to justify without more reasoning explanation given. No matter popular opinion, please do not combine Computer Science and Visualization together. I've heard this opinion spread among people in the Undergraduate VIST classes that think this would be beneficial, but none of these people are in the computer science minor and detest every minute in our own department's coding classes (granted, ours aren't good) and don't understand what a merger would fully entail. On the other hand, I fully agree that Visualization should be removed from the College of Architecture, and I understand how combining it with other visual and performing art departments sounds reasonable, however I hope any budgeting and allocation between the departments will be fair and beneficial for all involved.

I believe that the COSC program should remain in the College of Architecture as we more closely align with the architects than we do with engineers. Our main point of contact in the construction industry is with architects. Our program is also highly distinguished and is recognized as the best program in the country. I do not think changing the structure of the program will have a positive effect on the program overall.

I am a 5th year construction science student, and I have thoroughly enjoyed my time in this program. While there is rationale for the university as a whole to merge construction science and other related departments, I do not agree with

this decision. It seems as though this is a "bigger is better" decision over a quality related decision. Just because numbers and funding increase does not mean that merging colleges is necessarily the best decision. My favorite and most valuable classes I have taken throughout my time as a construction science student were taught by Aggies. Aggies who were a part of this program as it has been for the last few decades and who came back to improve the future quality of work and life that the current students are working hard to earn. With this being said, the Construction science program here is one of the best in the nation- because it is the way it is. Why change something that is already seen as great on a national scale? Texas A&M University is one of the best colleges in the world, and it is thanks to Aggies for that. Construction science has provided an extremely applicable experience for me going into the construction industry and I would hardly change a thing about the program. I think leaving it as is and allowing the program to thrive is the best possible decision here. Hopefully this note is read and considered, I appreciate the opportunity to provide my opinion. Gig 'Em!

---

I believe that the construction science department should stay within the college of architecture. Not only does it make more sense, it also allows us valuable time to mix and collaborate with other students in the architecture program to better understand their thought process when solving problems. As a construction science student I know that I will be working with architects in the future and I believe that it is enormously more beneficial to construction students to be surrounded by them during our education. Furthermore I have spoken with multiple legacies and professors who all disagree with the idea of realigning the program.

---

I think it's pointless and will deter people from this major. This degree plan is set to lead students into the project management sector and not designed to be a design degree but a management role. I think this change would be a major disservice to the degree and the future students who would like to pursue it.

---

The Department of Construction Science is a department that is full of some of the most amazing staff and faculty this university offers. This degree plan is also aligned to architectural needs which has been extremely helpful and informative towards my construction studies. I feel as if my education thus far has been greatly impacted by my architecture studies on top of my education in construction science.

---

Don't combine college of science with the College of Liberal arts because these two colleges are very different and by combining them, it will hinder both colleges.

---

I do not wish for the University Studies Architecture (USAR) students to be moved to the college of Arts and Science. Being immersed in the community at the College of Architecture is vital for these students, including myself, to be able to easily take classes dealing with what the major focuses on (Architecture, Global Arts, Planning, and Construction). The major even requires you to have one minor under the college of architecture, would this change? I don't understand how students will be able to be fully immersed in the culture of what they are studying if they are not even within the same college. I have fallen in love with my college (COA), and to be displaced in the middle of my college career, after already dealing with changing my major/college, would be devastating. I am a newly appointed COA Student Ambassador, would I lose this title? I am also worried without being under the college of Architecture, my major will be seen as less than or not as related to Architecture, which is unfair, especially for students already in the major. I struggled a lot my freshman year at A&M because I didn't enjoy my major, or the culture of my previous college. When switching my major I had a low GPA and wasn't able to be excepted into a major like ENDS, nor did I want to have to start over (ENDS classes being strict on the order you take them in would've required this). Furthermore, I still wanted to study Architecture, and the USAR major made that possible, but I feel that it being in a whole new college will make it much harder to feel welcome in architecture classes. Thank you for your time and consideration to read through this.

---

I have no problem with the COSC move to the college of engineering.

---

This is terrible. The roll out of the changes to the Education college have been horrific for undergrads. Imagining an even larger change seems like it exists to gut funding and harm students in both the liberal arts and science colleges. Proposed changes like shared advising ignores struggles like the existing advisor shortage and long wait times. The department of journalism has previously failed here at A&M, and I am not sure that it will succeed if tried again given the current atmosphere of the university. Similarly, opening up visual arts while good conflicts with developed programs at other universities that do not share A&Ms biases.

---

I think moving Construction Science to the COE is entirely appropriate. I feel as if there are more similarities to engineering than there are to architecture in many cases.

---

The one big thing for me is the implementation of music into Viz. I am a huge fan of music and using that as my favorite art form. I feel like Visualization can branch out and include more things such as performance arts and music production

or composition for video games and animations!

---

n/a

---

I am currently a Senior in the Construction Science program. I think that it would be a mistake to move the Construction Science program out of the College of Architecture. From my experience, it is most important for the Constructors to work alongside the Architect more so than the engineers. Base on the way most contracts are set us the constructor works with the Architect who coordinates with the engineers. Not the other way around. keeping in the COA and increasing the involvement between majors would be more beneficial for all than moving COSC into COE. The reason that I chose to come to TAMU was that the COSC program was not an engineering program. Like the school down the road TU where their construction program in Construction Engineering.

---

I don't think moving all the proposed majors out of the college of architecture is particularly a great idea. It would effectively destroy the culture and tradition surrounding the department which is part of the reason I love the COA as much as I do. Changing it seems like a great idea in theory but it just wouldn't work out in practice. As a user student focusing on architecture with a minor in Urban planning, it would be counterintuitive to take not be in the college of architecture.

---

I am a Construction Science major under the college of Architecture. I disagree completely with the realignment proposal of moving COSC to the college of Engineering. We are not engineers and do not want to be labeled as such. We are construction science majors and fall under our own category entirely. We are succeeding in abundance where we are at and I see no reason to move our major into a new college. I can see why the engineering college would like to have our major under it's umbrella, since we are the best at what we do, but we as COSC students do not want this change.

---

The creation and opening of a TAMU performing arts school would be huge to the growth of the university. When I was a prospective student, I had goals of pursuing theatre as a major in college. My dream was to be an Aggie, but A&M never aligned with my goal of pursuing theater, causing me to almost always say "I would love to go to A&M, but they are lacking in fine arts education." Another thing to note is that the state of Texas does not offer many prestigious performance education programs. Many students pursuing these have to go out of state, with their only other options being Texas State. With A&M's incredible staff, traditions, academics, etc., the addition of a Performing Arts School would make it incredibly competitive for programs in the state of Texas. Investing in the arts would have made my decision to come to A&M that much easier, and I know that it would be the same for many students.

---

I think the COSC department should be moved to Engineering

---

In regards to the academic realignment of the Dance Science program, I have a few opinions to voice. Firstly, and most importantly, the Dance Science program should NOT be relocated to a new college department. Being housed underneath the CEHD has been incredibly fruitful for the nature of our program. While we are a study focused around the performing art of dance, our curriculum extends way beyond just dance training. Our coursework, which is relatively equivalent to the studies of a typical Kinesiology major, has prepared us all for the professions we are seeking. Ask any dance science student and they will either be pursuing a DPT, OT, MD, or teaching career. Being housed under a visual and performing arts degree would severely limit our abilities to take the required prerequisites for any graduate program and would limit our knowledge. During my time as a dance science student, I have been exposed to higher knowledge about the anatomy of the body, how to properly asses body alignment, how to enhance one's muscular and physical fitness, and so much more. In comparison to other kinesiology majors, the knowledge I acquired early on often surpassed what they are just now learning as seniors. I was drawn to the dance science program specifically because it was a Bachelors of Science. If I had desired to pursue professional dance, I would have attended another university. Being aligned in the CEHD has provided an abundance of opportunities such as my recent completion undergraduate research and thesis. Having the readily available opportunity to conduct our own research opened the door to being a published author in journals and presenting at two international research conferences over the past year. I would strongly encourage the university and it's faculty to take into considerations the great affects it would have on its dance science students, both current and prospective. Additionally, the entire dance science faculty would not only have to completely purge the curriculum to fit the scope of visual and performing arts, but they would be losing the program they went great lengths to build. The TAMU Dance Science program is amongst the first in the nation, with many universities following in our footsteps. Realigning our degree to a B.FA would cause a retroversion in our efforts to bring our art into the science field. As a graduating senior and have gone through a majority of the degree, I would be highly

disappointed if our degree was realigned under another college. I have seen the greatness of what this program can do for its students. Dance Science students have the chance to make a real impact on the world and remaining in the CEHD is vital to that success.

Moving the Construction Science Department to the College of Engineering will not only ruin the culture of the department but will also negatively change the structure of the program, faculty, staff, and students. Being a department that heavily relies upon industry leaders, funding may be heavily reduced once under the umbrella of COE and students will not be getting the correct education to be successful in our industry. Most of our learning comes from industry leaders themselves, who would no longer be eligible to instruct under the COE. The professors that would take their place would most likely have little, if no, field experience. If COSC students wanted to be engineers, they would apply to be in civil, architectural, or mechanical engineering. In our career, we will work with engineers just as much as architects, but our career path aligns more with architects as we need to read and understand plans, provide ideas for constructability, and much more. I know many students, including myself, have asked for more architecture classes be integrated into our program. We are not attending university to become engineers and while the course load is not yet identified, having COSC students go through the freshman year engineering courses will be a waste of their time and money. It would not be in the best interest of students' futures to move the department to COE.

As a visualization student, I urge the university to follow the recommendations for moving Viz out of architecture and into a new college of arts. Viz suffers from a lack of space and money for class resources. The art minor is currently not even available to us due to budget cuts, and the video game design minor always lacks space for students in classes. We need a new college that will encourage the viz program along with related majors and minors to thrive, because currently our program is getting shoved to the bottom of the college of architecture.

Texas A&M already has an obvious emphasis and preference towards their engineering, science, and agricultural schools. Creating a new College of Arts and Sciences through merging the colleges of Liberal Arts, Science, and Geosciences makes sense in theory. This would provide Texas A&M seem comparable to other large peer universities, providing it with a larger undergraduate curricula and a streamlined school structure, however this would negatively impact the individual needs of students. This merger would have a negative impact on student advising, as I and my peers feel more comfortable reaching out to advisors within my own college that know my curriculum needs. The combination of the College of Geosciences and the College of Science, keeping Liberal Arts as its own entity. Furthermore, the merging of University Libraries into this new College of Arts and Sciences does not make sense. This should be kept as its own entity as well, and not merely combined into another category for the sake of ease.

In regards to changing the Kinesiology Dance Science degree plan, I definitely would not have come to Texas A&M if this program was any different. Getting a bachelors of science degree is allowing me to be able to apply to PT school, while dancing through college. It is the perfect plan for me, and many of my peers. Please do not change this, I can guarantee many of my peers in my Dance Science program came to Texas A&M mainly for the program.

The TAMU Dance Program has worked so hard to become integrated with kinesiology and push the practices of dance science to overall better the dance world! The connection between dance and kinesiology needs to stay strong. Although, a performing arts space to better dance would be a huge benefit, having our own space for performing and showcasing is desired. Except, dance needs to be it's own college, not combined with theatre and drama. It holds its own, and should not be pushed into a college with others who don't understand.

I am a Geophysics major in the College of Geosciences. In my free time, I work hard to develop my artistic skills, and have developed a strong realist style to channel my active imagination. I certainly sound like a poster boy for the College of Arts & Sciences, huh? WRONG. The reason I do art is because ART IS NOTHING LIKE SCIENCE. I do art because it enables the geophysical side of my brain to recover, while stimulating the other half. Everyone I have talked to about this merger- even Liberal Arts, which stands to benefit- HATES the idea of violently jamming our colleges together. ~~FURTHERMORE~~ Nobody wants to go to a College of Arts and Sciences. I've been looking for graduate programs this semester, and let me tell you, if I see that a program is hosted by a College of Arts and Sciences, I promptly ignore it. That title tells me that the degree is one of a million, that the university cannot give it the same attention which it would afford to a similar program from a College of Geosciences or a School of Earth and Space Exploration. When I hear School of Earth and Space Exploration, or College of Geosciences, or whatever, I can visualize in my mind a building stuffed to the brim with brilliant professors and inviting labs, guiding me to a bright future. College of Arts & Sciences? I see the entire degree living and breathing in a single whitewashed classroom in some forgotten corner of the campus. You might as well call it the College of Not Engineering for all the good it'll do you. The small scale of the colleges at threat here is what makes them special. In the College of Geosciences, I have the ability to get to know the students and

professors in a uniquely intimate experience that helps me escape getting washed away in the vast crowds which populate the campus. That community has kept me sane for the past two years. A lot of that community is threatening to leave if you conduct this merger, and according to rumor, many of the faculty who we've gotten to know and love will be fired as well. I would also like to address a rumor that the Eller O&M Building would face demolition as a result of this merger. DO NOT DO THIS. The O&M Building is the home of most of the College of Geosciences, and this only goes to show how little the university truly cares about our program, or keeping around any of the brilliant minds within it. Furthermore, as the tallest building on campus, and one of the first things anyone sees upon arrival, O&M enjoys a unique status as an icon of campus, present in every skyline I've ever seen. Its observation deck affords us breathtaking views which cannot be found anywhere else on campus. Go take a look for yourselves! There's something transcendent about being able to look to boundless horizons while eagles soar at eye level. Plus, the tower affords a perch for the finest weather radar in Brazos County. Now, as far as the arts program goes... I am not opposed to Texas A&M creating a music degree. HOWEVER. It is very important that we respect the established music program. The Texas A&M band program is admired nationwide for its unique offering of music programs for non-majors. Just ask our new teacher Dr. Sample! He came from University of Minnesota, and will be the first to tell you that our band program is a league above any other non-major program in the entire nation. Why do I bring this up? The introduction of a conservatory-style program, and the limited space in our brand-new music facility, leads me to fear that the music program would suddenly become much more competitive and much more exclusive. Non-majors such as myself would be quickly flushed out of our very own program. WE NEED MUSIC. Most of my semesters at Texas A&M, band has been my ONE "brain break" class- one of two regularly-scheduled opportunities to recover from the usual rigor of school, the other being church. I love playing the bassoon and have been endlessly fortunate that the university gives me the opportunity to continue my passion for music while working on building my future in geosciences. The University Bands will be performing in Rudder Theatre on December 5, at 5:00 PM. Please attend... you will start to understand why this program matters so much to us. Listen to Director Tipton wax poetic about his beloved students, all of who choose to be there every single day. Listen to the Symphonic Winds put on a performance that could stir anyone to tears. Please, just... listen. To all of us. Geoscience, Liberal Arts, music... our stories matter. Don't destroy the programs which make this university.

---

Keep major specific advisors. They are experts at what they do.

---

As a student in the College of Liberal Arts, many of these recommendations are especially pertinent to me. While I am uncertain about creating a large combined college of art and science (I can see how difficult that would be to actually do and worry if it would be TOO large and broadly focused), I can certainly recognize the value of advocating for more of a STEAM approach. Science and art have traditionally been kept a part as two separate disciplines, when in truth, they intertwine and influence one another so much. I love the example given from Purdue University where "theater students take classes in design and stagecraft to learn construction trades, and students in Fine Arts learn to use design technologies and studio tools." Every art has a science, and every science has an art! Students need both for a well-rounded education. Texas A&M could be a real leader in upper education in Texas by incorporating the two together. I feel very strongly about Texas A&M opening up more opportunities to study the arts on campus, particularly the fine arts. I am a member of the MSC Visual Arts Committee on campus, and at our gallery reception a few weeks ago, [REDACTED] spoke about how A&M students have limited opportunities to learn about the arts. He said the one negative thing he consistently hears people in the professional world say about Aggie graduates whom they work with is that they have little knowledge and experience with the visual arts and the culture that surrounds them. He said he has hoped for a long time that A&M will one day have a College of Fine Arts, and when I shook his hand at the end of the reception, I told him that I hope that too! Because we don't have a fine arts department, Aggie students have had to take the initiative of bringing art on campus, such as with the creation of the MSC art galleries. I became involved with VAC because I want to further my learning of the visual arts and collaborate with others who understand their importance. I would love to be able to pursue a minor in art and utilize it in my future career. The art minor is currently closed to accepting more students, but when it opens, I intend to take advantage of it! I assure you that there are many other Aggies like myself and [REDACTED] who would be elated for there to finally be a Fine Arts college at Texas A&M University - not to mention all the potential students who will be even more drawn to A&M if they could actually pursue a degree in the fine arts here. A&M is already known for being one of the best universities in many ways, but so far it is failing at providing its students with the education in the fine arts that they need to thrive as human beings in our multi-cultural society today. As a student and as an Aggie, I wholeheartedly support these recommendations. I also appreciate the value of creating more musical education

opportunities and a separate Department of Journalism. I was involved in both band and UIL Journalism in high school, and both were wonderful learning experiences for me. Students who want to further their learning in these areas and / or pursue a career in them should have a better opportunity to do so.

I think that moving the Department of Construction Science to the College of Engineering will be detrimental to the program. Our construction program is globally recognized and accredited through architecture. Removing that will lump Construction Science into the category of another failing program. The reason that the program is so successful is because the faculty genuinely cares for their students and not their personal gain. They may not be the perfect people in the eyes of the university because they don't do research or hold graduate degrees but they get the job done and they get most every student hired who attends the program. The statement made about construction and engineering being hand in hand couldn't be any further from the truth. Constructors construct. Engineers design and calculate. Yes they are grouped in the same umbrella of work, but the activities performed daily couldn't be more different. Part of the differentiation between the two stems from hands on experience. There is an experience gap that engineers will never be able to see. I will be writing a formal letter and submitting it to Dr. Banks.

Construction Science is a unique field that does not belong in the College of Engineering. Construction needs all the business classes as most of us will go onto to control construction project finances. Also, most of the structure classes we have now are way too advanced for even the jobs we enter. Engineering classes will provide absolutely no benefit to Construction students entering the general contracting world. The college of engineering and what Construction Science teaches are two separate things that should not be included together. Engineers job and construction do not mix even on a jobsite as engineers don't build actual buildings, construction guys are the ones on the job building buildings.

Advisors must stay major specific. There are too many majors for non-specific advisors to be well versed in their students' needs. Students in different majors not only take different classes, but also have different career paths, internship opportunities, and require different advice. Further, to combine colleges into one college of liberal arts and sciences is ill-advised. These areas of study are far too different to be lumped together. The liberal arts at this school are poorly funded as is, if we are to share funding with the sciences, we will disappear.

I think merging all of these colleges into one will dilute who they are in essence. I am proud to be in the College of Geosciences. It lets people know what type of major I have and sets me apart as a STEM major which is a nice reward after switching majors from History. If it becomes the College of Arts and Science I lose that recognizability. I also have questions regarding a possible degree plan change. I chose my specific major for the classes that come with them. I did this meticulously and I do not want to have any classes changed.

I am not in favor of the merger of the College of Liberal Arts, Science, and Geosciences, and the University Libraries, with the new organization renamed Arts and Sciences. This would combine too many important and incredible different degrees into one program. I do not think this is fair to the students within the College of Liberal Arts or the faculty members that directly serve us. As a liberal arts student, I believe that this field is just as important as others and should therefore retain its own unique college.

It shouldn't matter that geosciences, sciences, and liberal arts are small colleges. Having them separate allows for closer relationships between students and faculty members which leads to better academic performance (in my experience). Other universities can combine them into one college but it is unnecessary.

Do not combine Liberal Arts, the College of Science, and the College of Geosciences into one department. I just think about all of the student organizations that fall under those existing colleges, and how this realignment would change their structure or could even dissolve them. In creating student organizations based on college, how would this realignment change that? If these colleges all merge into one department, would that dissolve organizations like Liberal Arts Student Council, Geosciences' Council, and other clubs that students gravitate to because of their majors. I just don't think this realignment would be helpful in considering existing organizations that current students devote a lot of time to. If this is going to be done I just feel like students involved in these college-specific organizations should not be overlooked.

I'm a little iffy on the "combine the college of sciences and liberal arts" method as I'm worried that 1) Funding for my labs will be reallocated or reduced and 2) I'll be paired with advisors who aren't really familiar with my major/pathway. As long as each major gets advisors specialized in that major, I'll be on board with this plan! I'll be even more on board if we get a centralized "science and liberal arts" building like the college of Engineering has! I do question whether combining colleges will make the competition/seating per major harder to get? I heard ETAM(engineering) was super hard to get into (for a preferred major) simply because there were a lot of options demanding a lot of requirements. I'm

looking forward to whatever changes y'all make!

---

I think the total reshaping of the college of architecture especially with possible movement of construction science to the school of engineering is a poor thought out possibility. Understanding what Construction Science is as a whole is much greater than just switching it to an engineering based degree. Construction Science at Texas A&M has become so prestigious on the nationally ranked level for many reasons majority which are from being based in the school of Architecture allowing for students of similarly based majors to coexist in which mimics the real world in which these students of these degrees would be working side by side in the future allows for a great flow of future connections and grasping a greater understanding of the array of career options involving architecture .

---

As a student who has been in both the college of engineering and the college of architecture in the department of construction science, I am against cosc being moved into the college of engineering.

---

If y'all do this I'm transferring. A stem degree is no where near a liberal arts degree. The work load is completely different. It's disrespectful to science students.

---

As a former engineering student and current construction science major, I find the realignment of the Construction Science department with the College of Engineering to be the worst thing that could be done to the College of Architecture and to the integrity of the Construction Science degree. Having students be subject to the ETAM process for construction science is by no means applicable to the construction industry nor does it truly identify potential members of the department properly. Construction is NOT engineering and is by far the most closely related degree to architecture outside of any ARCH courses. Not only would the department be subject to the same disconnect that many (research) professors have with students within the college of engineering, but also the department could end up being flooded with faculty and staff that have less experience in the construction industry than it does currently. In summary: "if it ain't broke, why fix it". The Department of Construction Science has long been one of the most respected departments at Texas A&M and is considered the top producer of construction science majors in the country. The current structure and make-up of this degree plan is by no means in need of such destructive change, regardless of what a respected consulting company may say. Personally, I believe such a change would cause more harm than good.

---

Keep the kinesiology aspect of the dance program. It makes the dance department unique to the other degree programs out there. It makes sense to move HLKN to public health. Making an arts & sciences college makes ZERO sense. Geoscience and arts don't belong together. Geosciences might make sense to be with construction science or agriculture. If you want to emphasize arts, make a performing arts center and create degree plans that include science classes. Most of all, keep the degree plans and programs unique.

---

I believe moving the Political Science department under the Bush School of government (as well as the other recommendations regarding the Liberal Arts merger and Bush School merger) would be a great change.

---

Texas A&M's dance science program is the best in the nation and not to mention it's the only dance science program in Texas. This is just one of the many qualities of A&M that draws students from all over. Merging the dance science program with performance arts would diminish the voice of the dance science program and take away from the "science" aspect of the program. If the merge does happen, the best option to prevent this would be to have the dance science program its own program within the performing arts. This lets everyone have a voice and doesn't hinder any current performing arts program's voices.

---

I do not agree with the combination of the College of Liberal Arts with the College of Sciences. It does not do justice to the degrees that are earned within the College of Sciences. College of Sciences should remain a separate college. I think adding a performing arts department and journalism is good. It makes sense to move Visualization to College of performing arts, but Construction science should not be moved to college of engineering. They are too different. Construction science is not an engineering degree.

---

Geoscience and Liberal Arts don't seem to be that closely related, so I question why they would lump them together into 1 college.

---

There is no reason for the merger of the College of Liberal Arts and the College of Sciences. Both Colleges have completely different aims for their student body. The College of Liberal Arts' education is based in the humanities. Its goal is to instill cultural sensitivity, a commitment to diversity, and critical thinking. A Liberal Arts degree is focused on understanding the human condition through social sciences and humanities. The College of Sciences does not fit in this landscape. It is not focused on the human condition. The College of Sciences seeks to understand the laws of the universe.

I support the decision to create Visual and Performing Arts School, as well as the relocation of Economics to the Bush School.

The reason why I chose to come to A&M in the first place was because of how unique the College of Geosciences is. We have become such a close knit college which makes me feel at home at A&M. Another reason I am so against the merging of these Colleges is because it is taking away from each specific college. It diminishes the quality of work on our transcripts because none of us are studying ARTS AND SCIENCES. Just arts OR sciences. The students are studying completely different things. I chose my major and college for a reason because I have a passion for the sciences. I know I do not want to be involved in the liberal arts because I never had a desire to take those specific courses. Now it seems like you are forcing it down our throats. I am genuinely sad and disappointed at our school. You are taking so many colleges away where students can feel special. The sciences and arts should stay separate period. They are too different to combine.

In general, I think the proposed merger of the College of Liberal Arts and the College of Science into a College of Arts and Sciences is a decent idea. I think that the larger size and large access to resources would positively improve both colleges. However, if this is done then it cannot be as poorly handled as 25x25 has been. Because of 25x25, we have far too many students and far too few professors and resources for them. In addition, 25x25 makes us look like a degree factory which decreases the value of all degrees at Texas A&M. For a College of Arts and Sciences to boost the overall value of Arts at A&M to a point where it could one day rival UT, we cannot look like a degree factory - we need this College especially to have a reputation of being challenging of traditional norms and progressive. It would need to have amazing resources, far better than what a lot of our colleges have. Which is why it concerns me that one of the rationales for this new College of Arts and Sciences is a "significant cost savings." While I recognize that there are many issues with the structure of TAMU that has led to a funding issue, the creation of a College of Arts and Sciences should not mean a reduction in budget or wages for professors. It should not mean less overall resources for both colleges - if anything, it would need more while it is being set-up. As a side note, I would like to see more data on just how a College of Arts and Sciences would be an improvement for students and professors than this report gives. I think the School of Visual and Performing Arts is an excellent idea. I think it would especially work with the Department of Visualization as its current location in Architecture is confusing. However, I cannot stress enough that the resources (especially technology) for all of these programs need massive improvement. Likewise, I would love the reestablishment of the Department of Journalism. I think it would be great if, in addition to The Battalion and KAMU, this department would also work with students orgs like KANM, SWAMP, and The Mugdown. One thing that confused me is the lack of any plans for Mays Business School. Why is this? Is there not any way to integrate it more to the campus community?

As a student in the College of Liberal Arts, I feel like moving and creating a school of Arts and Sciences would impact the spirit of liberal arts and what it embodies. I would be fearful that if the College of Liberal Arts were to be moved into the College of Arts and Sciences that we would lose the same amount of focus and attention that we currently have.

The combination of various colleges into one centralized Liberal Arts and Sciences college seems reasonable. However, I am concerned about the absorption of certain smaller departments. As long as smaller departments are kept and all degree programs are still offered under this consolidated college, I support this action.

I think it would be a mistake to combine the college of geosciences, the college of sciences, and the college of liberal arts. The current size of each of the colleges allows students to become more involved in each college and meet other students who share similar beliefs and passions. Also, the college of liberal arts doesn't match with the other two colleges on curriculum.

What interested me the most about TAMU geosciences is the small feel and closeness felt throughout the entire department. It is a very small college so we are able to have extremely good relationships with our professors, advisors, and peers that cannot be matched anywhere else at TAMU. After being committed through athletics, I was torn between what to major in. I met with advisors in Animal science, engineering, and geology. Within the first few minutes of talking with Mrs. Rosser, I knew that geosciences was where I needed to be. I did not want to be in a large college that I had been warned about. If TAMU geosciences was not as close-knit as it is, I most likely would not have come to A&M, even with my athletic scholarship. Speaking with my classmates, their biggest reason for choosing TAMU geosciences was the small size of the college. With combining geosciences with science and liberal arts, that feel the charm of TAMU geosciences would completely be killed and I truly believe that less students would come into geosciences.

The decision to combine the Colleges of Geoscience, Liberal arts and Science into one Unified college I would argue is

unwise. It would serve only as a means to elevate the importance of the Liberal Arts College while diminishing the value of the other colleges. Graduating with a GIS degree from the College of Arts and Science is a lot less appealing than a degree from the College of Geoscience. Additionally I find it likely that one fund for the three colleges will result in fewer classes for all the colleges, meaning it will be more difficult to get and take specified classes. I would argue that one of the strengths of A&M can be linked to the separation and specificity of the various Colleges that the University offers.

---

I don't like the idea of the new arts and sciences department. Liberal arts and sciences are extremely different and I am afraid that consolidating will also consolidate the resources for each respective group. I do like the implementation of a journalism degree, as well as the implementation of Political science into the Bush School. However, I will say that as a double major in political science and sociology, I would not have been able to pursue this double major if this was the case when I came to A&M.

---

I fully support and agree with the academic realignment portion of the report. As an undergraduate Political Science student, transferring the POLS Department to the Bush School seems to be common sense. Most of my Political Science classes are already located there. Part of the appeal in attending Texas A&M was the close connection to the Bush School, and further deepening that tie would serve as a great recruiting mechanism for undergraduate students.

---

I am in support of finding more connections between arts and sciences, which can be developed through a combined college. As someone majoring in arts and minoring in sciences, I'd feel like I'd belong somewhere rather than being torn between two colleges. Additionally, I am thrilled that there may be a department for journalism. Most colleges have majors dedicated to journalism, but here it is labeled as a university studies major. Journalism is an integral part of society and needs a department to be more reflective of this. Creating this department could boost student numbers in this field as a result. However, the idea of "building your own major" is excellent as students may enjoy multiple areas of study and also goes to show how well-rounded A&M students can be.

---

Having a larger undergraduate curricula is not always a good thing. One of the reasons I love TAMU's sociology program is the closeness and availability of advisors.

---

Agree with merging of colleges and creating a College of Arts and Sciences and also the Bush and POLS merging.

---

I would propose that during the merger that creates the College of Arts and Sciences, the BS of Economics degree should be transferred to the Mays School of Business, as it is more quantitative and business oriented than its BA alternative. A few prominent schools have made this transition already, including the world renowned Wharton School of Business, where a BS in Economics is available. I think this transition would more accurately represent the education as well as the career paths that those who enroll in BS of Economics hope to pursue. As a BS of Economics major, many of my peers, including myself, feel that this major would be more respected and sought after as a business degree rather than a liberal arts degree. Thank you for your time.

---

You are devaluing my degree by putting me with liberal arts

---

I respectfully think that there shouldn't be a merger of departments or libraries.

---

Make Economics go from College of Liberal Arts to May's Business School. Makes more sense.

---

As a liberal arts student in the performance studies major, it is paramount to offer the majors listed to implement. Students in this department are always considering transferring to different universities to study the arts and the number of majors is under 50 in total. We as a community feel neglected by TAMU because though this school is STEM focused, the major here is offered and should be accommodated in the same ways STEM majors are accommodated. We also feel that the school needs to build their arts programs to keep students who want to study arts, enrolled at TAMU.

---

All of the proposed academic realignment changes make a lot of sense, and would help A&M appeal to a broader range of students. Additionally, by creating a new School of Visual and Performing Arts, more majors could be created, and the majors that currently exist that would be transferred to the new school will have an improved experience and better education, since degree plans are more streamlined.

---

I am a political science major and the academic realignment plan removes a lot of the mystification surrounded by university studies programs and would make everything much more streamlined. I wanted to double major in political science and journalism but when I tried earlier this month I was denied because technically journalism isn't a major just a university studies program which doesn't really make sense. The creation of a journalism department and the combination of the bush school and political science with Econ and international studies possibly following suit should be something that is done as it will give undergraduates better exposure to graduate school and research. The current

---

political science program isn't properly run with confusion between advisors about degree requirements and a lack of program leadership which should also be addressed. In conclusion, the suggestions made are sound and I agree with them but I think we should go a step further and ensure majors have a clear leader and requirements.

---

In Academic Realignment, under Recommendation #2, I would like a Performing Arts Center, IF there can be a Department of Dance by itself, not a Department of Theatre, Drama, & Dance. This is so we can have an equal voice in the arts and maintain the identity of the Dance Science program. Texas A&M is special for its internationally well-known dance science program and to keep that alive and help it have a bigger voice in the world would impact great opportunities for future teachers around the nation/world and dancers working toward PT school. Texas A&M is also the only college in Texas with a Dance Science program and has the leading Dance Science program in the nation, and to loose that would break a lot of aggie hearts, including mine. In conclusion, to keep the dance science program within the department of dance to help the voice of the program alive would be amazing!

---

I support establishing a new School of Visual and Performing Arts and building new facilities for that, but there is considerable concern from the Dance Science Program that the arts will be sufficiently financially supported, especially since just last year, the Dance Science Program was nearly downsized. I do believe that Dance Programs will grow and thrive in the School of Visual and Performing Arts, with a higher level of visibility, and new facilities will attract talented artists, which will also grow the program, so I ask that A&M be sure that they can keep this promise to invest in the arts. In addition, I believe that Dance should be it's own department in the School of Visual and Performing Arts. This theoretical Department of Dance could still collaborate with a Department of Theatre and Drama, while still having it's own department head to prioritize each department's needs, since the needs of dance differ from the needs of theatre and drama. This would be especially important if A&M wishes to keep it's attractive Kinesiology: Dance Science major that is sought after by many prospective physical therapists and dance educators. If dance was its own department, it could more easily create a curriculum for Kinesiology: Dance Science majors, perhaps in conjunction with the School of Public Health.

---

The College of Geosciences needs to stay seperate. The identity of our college is based in Earth sciences and more broadly science in general. Combining our college with liberal arts hinders credibility, as well as will lay off many employees. If wanting to compare structures to other colleges, the University of Florida when they did this restructure essentially killed their Meteorology program and laid off many professors with tenure. Combining the seperate colleges into one loses all of their identities and hurts credibility. There's a bad example with doing this already, showing that this is a bad idea. Making this change would be a massive mistake.

---

I agree with Recommendation #2, but only if the dance program remains a separate department so as to maintain its unique identity. Through its focus on science and research and it's seamless combination between the arts and sciences, this program has made an international impact. Furthermore, it is the only program of this kind in Texas and is the #1 dance science program in the country.

---

In regards to the New College of Arts and Sciences, I am concerned about the effect on the Kinesiology Dance Science major, as this major relies heavily on both the dance and kinesiology programs which would be split under the new plan. I chose to attend TAMU because of the unique Kinesiology Dance Science Bachelor of Science degree that they offered. I want to ensure that if it was moved from the current College of Education and Human Development to the proposed New College of Arts and Sciences, the Dance Science degree would remain unchanged. Majority of the students in Dance Science need the BS to go on to professional schools such as PT, and I am very passionate about leaving this opportunity for future TAMU Dance Science Students. I want to make sure in the new plan, Dance Science students would not be restricted to only the College of Arts and Sciences, but also fulfill all of their kinesiology requirements in the School of Public Health. I do not think dance should be lumped into the proposed Department of Theatre, Drama, and Dance within the School of Visual and Performing Arts because the dance department is very unique in offering a University Studies and Kinesiology Dance Science track. Dance could be included in the School of Visual and Performing arts, but it should be its own department. The dance department is already very diverse in the products they put out. There are unique dance performances and financial needs that would only be complicated by mixing with theatre and drama. The dance department needs its own faculty and leadership for freedom in these decisions. I believe if these three departments were connected, Dance Science, in particular, would suffer. While the art of dance is important in this degree, the sciences and kinesiology give it its value. I want Dance Science to have dance specific staff that can pour into students in the kinesiology aspect without distractions of mixing with theatre and drama. The dynamic of the dance department between faculty, students, and learning interests is already very closely knit, and part of this reason is because dance is its own department.

Texas A&M is unique in that it has a Dance Science program housed within Health and Kinesiology. The proposed academic realignments of adding a School of Visual and Performing Arts and the School of Public Health present concerns for us as students that are currently pursuing a Bachelor's of Science in Kinesiology with a concentration in Dance Science. With the new realignments, where would our program be placed? The unique and niche nature of this program is a huge draw in for students who have a passion for both dance and the sciences and want to pursue a career that combines the two. I don't think these things have been factored into the current proposal for academic realignments, and we believe that it is vital that our Dance Science program be preserved and separate from the department of Theatre, Drama, and Dance. It would be impossible for our program to receive the support we require and stand out the way we do with the current organizational structure with the proposed realignments.

---

As a dance science student I am concerned about a few things. Would the dance science keep the bachelor of science? Dance science students would like to continue taking kinesiology classes. How would dance science and kinesiology still work together? What if the DSC degree says no to the college of arts and sciences...will we still use the center of performing arts? We don't want to lose the connection of what our degree plan is right now. As of last year, there was a scare that the dance program was going to be downsized. How can we trust there will be enough funding to the in order to expand the program in the new arts and sciences school? I don't want to be in the department of theater/drama/dance because it would diminish our voice as a dance program. Our degree is unique in offering ballet and modern over the theater and drama oriented dance classes. Our degree of dance should be its own department within the arts and sciences, in case this change were to happen. Overall, dance science should stay connected with the kinesiology in some capacity even if a performance center is created.

---

Your report findings show that you want to increase the emphasis on art, be it media or music in nature, but there's currently an issue with the art program itself. I am a student with an art minor, but I am currently one of the last students in that minor. It is underfunded and understaffed. I would love to see more of an emphasis on the arts and be able to take a wider diversity of art classes and have a&m have a higher priority for it, but we currently lack so many students because we lack the ability to do so. If we could start focus now on expanding and making the arts more accessible to all students interested, it would be greatly helpful.

---

Fund the arts please! I'm an Art Minor and it breaks my heart to see that you are not funding the art minor. Growing the Arts at Texas A&M is suggested in the report and you are doing the exact opposite! Please fund the College of Arts and Science! I would like more access to art classes and I also want more students in the future to have the chance to be art minors as well. I know I'm not the only student at Texas A&M that wants to minor in art. Please show us that you value the Art Minor and the Arts by allowing us the funding to hire more faculty, use more classrooms, and more supplies. I truly love this program, please fund it.

---

I enjoy the small community of the College of Geoscience and how easy it is to find other students with similar interests. Combining the colleges would definitely make it harder to find the geoscience community and find academic and financial opportunities that pertain to the geosciences.

---

I believe that combining the Colleges of Liberal Arts, Science, and Geosciences to form the College of Arts and Sciences is not in students' best interests. The rationale cited in the report is that most other large institutions follow the model of having a College of Arts and Sciences, so we should as well. Is A&M now more concerned with prestige than quality education? Merging these three incredibly different Colleges will be detrimental to students' college experience. Instead of having curated, personal, and relevant funding and advising, each student will be lost in the size of such a huge, disjointed College. For example, my engineering friends don't enjoy feeling like just another student in a mass of others. Their advisors don't know them personally. I'm a student in the College of Liberal Arts, and my favorite aspect of my College is how small and curated it is. Another reason I believe the merge would be detrimental is that there would be less major-specific focus and more focus on the College as a whole. Combining 23 departments and 124 degrees will not bring any more specificity and personalization to students' degrees, classes, and experiences. It will only lower the quality of education that we receive. The Arts and Sciences aren't similar. It doesn't make rational sense to combine them. It appears that Texas A&M is more concerned with how it appears to other universities than how well it educates and prepares students for a career. Combining the three Colleges is a change that doesn't need to happen, and will only harm the students involved. On another note, I think that creating a Department of Journalism within the College of Liberal Arts would be beneficial.

---

As a STEM major and member of the College of Science, the combination and formation of the College of Arts and Science is not satisfactory. Being a STEM major allows for strong and additional development related to STEM material. However, being combined with geosciences and liberal arts will poorly change this reputation.

Regarding recommendation #1, I feel strongly that the three colleges should remain separate. The college of geoscience is a smaller college, but that is part of why I have done well in my studies. There are many advantages to being in a smaller college. There is a sense of community between the students and faculty, and there is a sense of pride that comes with it. In my NSC, the faculty stated that being in a smaller college within a large university was one of the many benefits of choosing a major in geosciences. It allows you to form relationships easier and creates many opportunities to further your studies. I agree that there should be an easier process to change majors and that advising should be more connected, but this can be done with coordination without combining the colleges. The erasure of the College of Geoscience, College of Liberal Arts, and College of Science could potentially rid of many opportunities and systems in place that are beneficial and unique to each college. I believe that many staff and students feel the same way.

---

The College of Science SHOULD NOT be consolidated with the college of Arts.

---

“The consultant team was asked to identify changes that would restructure Texas A&M University in a significant way to increase effectiveness and transparency and to contribute to overall student success.” Well, y’all definitely achieved the first half – restructuring TAMU in a significant way. But y’all definitely missed the mark on it increasing effectiveness and contributing to overall student success. If the College of Geosciences is combined with the College of Science and College of Liberal Arts, that would decrease the effectiveness of our departments and most assuredly would not lend itself to student success. It makes much more sense to merge the College of Liberal Arts with the College of Architecture. Yes, we’re (College of Geosciences) small, but we are home to one of the best (and few) undergraduate meteorology programs in the nation and world; merging us with the College of Liberal Arts would be such a disservice not only to us, but also to the reputation of TAMU. “More than half of peer institutions house their schools of liberal arts and sciences in a combined college.” Well good for them. Too bad we’re Texas A&M University, and not some nameless peer institution who’s made the choice of profit over student success. I can speak for the vast majority of meteorology students when I say that WE DO NOT CARE ABOUT BEING THE BIGGEST COLLEGE ON CAMPUS! Leave that to engineering or someone else who gives a damn. Why would I want to be enrolled in a college that offers extremely specialized STEM degrees but also pointless linguistics, gender studies, and psychology degrees in the same college? I wouldn’t. I would want to be with others who are passionate about earth sciences. If only there were a college dedicated to that...oh wait. “This larger college structure creates a stronger advocacy for the liberal arts education at a STEM-focused university.” How about going to a liberal arts-focused university, then? If this is about recruiting students and faculty, think about how many you’ll be LOSING if this merger goes through. Recommendation #2 of the Academic and Strategic Collaborations section is focused on “recruitment and retention of undergraduate students.” Combining colleges into one would drive new STEM students and faculty away, as well as pre-existing ones, to other meteorology schools across the nation. Our professors are so incredible, they’ll have no problem leaving before stuff hits the fan and finding another job at a university that actually cares about them; underclassmen may retaliate by transferring out because this isn’t what they signed up for. We literally laugh if someone asks if we’re a liberal arts major. Do you see the bags under my eyes? In what world is it logical to put absolutely useless majors like psychology, gender studies, and sociology under the same roof as majors that are REQUIRED to take courses above calculus 3? It’s honestly offensive and insanely insulting to even consider housing these degrees within the same college as if they’re connected. Combining three vastly different colleges into this one huge college would also immensely devalue our degree. I want every cent out of the \$80,000+ I’ve paid for my specialized secondary education to be worth it. College of Geosciences students pay nearly \$200 more per semester in tuition and fees than College of Liberal Arts students. Either keep our degree separate and worth that extra \$1600, or lower our cost of attendance to that of our peers. “In addition, there should be significant cost savings by reducing three administrative college structures into one and using those funds to support the new College academic and research mission.” I just \*love\* how this is the last thing mentioned, tacked on to the end of the rationale like it wasn’t the main reason to begin with. Streamlining the three \*very different\* administrative college structures into one is not a good idea. My understanding is that currently, a donor can donate directly to a specific department within the College of Geosciences, such as the Atmospheric Sciences department. If we were to combine this into one centralized administrative structure for a single college, this direct donation wouldn’t be possible any more. The funds would have to be donated to the College, and then the administration would distribute as they see fit; so why would they give much or any of that money to a college that’s responsible for only 8 majors, even if the funds were intended for them? There would be so much unhealthy, underlying tension and animosity between us and the liberal arts – students and professors alike. We need all the funding we can get to keep our current college and department running. A good portion of our funding goes towards the upkeep of our Doppler radar. Using this radar and our upper air

equipment, we help contribute potentially life-saving data to the National Weather Service and local media. Without funding, we can't do that. In April 2019, our student meteorologists reported a tornado – later rated EF2 – after going up to our 15th floor observatory, sparking further action locally and saving lives. It's almost like someone is trying to buy out the College of Geosciences. "To ensure that each College focuses on its mission and are not distracted with students who do not have the qualifications or interest to enroll in a College degree program, the University Studies program should be unified in the College of Arts and Sciences." Excuse me? I don't fancy being the junk drawer of the university. So not only are y'all shoving three incompatible colleges together, you're going to stick every undecided and unqualified person in the entire university into this college, furthering backlogs. Keep University Studies with Liberal Arts, yes, but don't you dare bring it within 6 ft of Geosciences.

---

I am opposed to the proposal to dissolve the College of Geosciences. I am currently pursuing my Bachelor of Science in Meteorology and working as an ambassador for the College of Geosciences. As an ambassador, I have seen how large of a pull factor Texas A&M can since it is one of the few universities with a college reserved specifically for geosciences on its campus. In addition, within our college, we have the most comprehensive geosciences programs in the world, and we are the only comprehensive program in the nation. The College of Geosciences is a small college, however; that also helps bring in a diversity of culture through students who want to pursue a degree in geosciences. I, for one, was further allured to come here because I loved that the College of Geosciences was large, yet small enough to provide a welcoming feeling. I was able to come in and have a prospective student meeting with Dean Thomas and Judy Nunez about the college and I immediately felt like the College of Geosciences was home and where I was meant to be. I have loved every minute of my college career and I can owe that to the College of Geosciences. I applied to be an ambassador for the College of Geosciences because I wanted to be able to share my love for our college, amazing faculty, and numerous opportunities because of our size with prospective students. I have sat in on and hosted numerous prospective student meetings where the student and parents' eyes have gotten bigger and they have sat up straighter at hearing about the number of research grants we receive, research opportunities, connections we are able to make and the student to faculty ratio. Being the small college that it is, I have been able to make connections with Dean Thomas and multiple other faculty members from each department within the College of Geosciences. I have thoroughly enjoyed every minute that I have spent with faculty within the College of Geosciences, and it has made me feel at home and more like a person than just a faceless number within the masses. In addition to making connections, I am concerned for the livelihood of the College of Geosciences Living Learning Community (LLC). My joy within the College of Geosciences is also owed largely in part to the LLC because I had the opportunity to live amongst my peers and further get closer with them through a range of activities. I would hate for the future geoscientists to not be able to call themselves geoscientists or have the same opportunity that I had in my freshman year. Furthermore, I had the opportunities to be on research teams as a freshman since the College of Geosciences is home to 9 research centers and consortiums, numerous research professors, and receives numerous research grants. These opportunities are huge for us and our careers, giving us the chance to do research as an undergraduate, sometimes with our own proposals, and present at national conferences. I have read the report that combining the College of Geosciences with others will help save money. While money can be a factor, combining the College of Geosciences with other pre-existing entities will just prove a sentiment most know to be true - Texas A&M University will prioritize money above all, even its own students.

---

It would bring shame to this university to remove the College of Geosciences from the position it deserves as it's own college for the unsustainable egos of a donor. The work that students and researches carry out at the College of Geosciences is the future, and it seems contrary to A&M's core values to try to actively suppress the quality of education of so many students that were drawn to attend this university specifically for all the small-college qualities that you would be taking away. You would be ruining the careers of so many of your students by cheapening their degree and causing it to be less competitive when it comes from an arts college. While it is an admirable idea to try to build a stronger arts presence in this university, it is wrong and will bring about more harm than good to destroy another college in the process. I, and many other students, beseech you to rethink these recommendations and disregard them.

---

Merging the Liberal Arts, Sciences, and Geosciences colleges will severely hurt the scientists and geoscientists. First, the general academic advisors will be ill informed of geoscience and science classes and opportunities. Moreover, this merger will also discredit geoscience and science degrees. Geosciences and sciences are not related to liberal arts. This gives a false impression to recruiters and can confuse hiring companies. College of Geosciences is more credible than College of Sciences and Liberal Arts to recruiters. Liberal arts is not related to sciences or STEM degrees. The coursework is completely different. This misrepresents the geoscience major completely. I want a geoscience degree not a liberal arts degree. My money is investing into my degree in order for me to find employment. Find a different way to increase

enrollment in Liberal Arts without hurting the entire geoscience and sciences department.

---

I fully disagree with the college of geosciences being cut. This is a ploy to prevent studies about climate change. I have lost so much respect for this school.

---

Don't combine the Geoscience College with the Science and Liberal Arts. The funding for Geoscience is vital for our climates health and should NOT be spread amongst other majors.

---

I do not like the idea of combining liberal arts and Geosciences. Texas A&M university has been known for its wonderful Geoscience program, it's unique it's well known. I transferred here for the Geosciences, the fact that it was different is what brought me here. If it is combined with the liberal arts then it loses that distinction, and students like me would overlook the program when deciding where to transfer. I ask that you please reconsider the idea of combining the Geosciences with liberal arts.

---

The Department of Journalism should be established. As a Journalism student, It sometimes feels as if we are left out. There is not much attention to students in this major. Being able to have our own department will help us succeed in the future. Having the opportunity to specialize in broadcast journalism, photojournalism, and print will allow us to grow as journalists. This expands the opportunities we have after college as well. Being able to find better jobs and internships will also strengthen the Former Student's Association. We will be able to network with other journalists and eventually, help other Aggies get jobs in news. The news industry is growing and having this department will benefit not only Aggies but the whole world. Journalism is changing and so should TAMU's use of it. Along with this, I believe that Mays Business School should have a Marketing and Communications collaboration with Journalism. This will allow students to gain better knowledge of the advertising and PR world. Journalism skills are key to any good profession but especially those in advertising, marketing, and PR.

---

I think the Bush School should merge with political science, economics, and international studies

---

As a University Studies-Architecture student who is taking several construction science classes, I have my concerns about proposed changes in this area. I was formerly an engineering student, and I think the Entry-to-a-Major system is bad enough for current engineering students, and I don't think that system would make sense at all for Construction Science. (Side note: If the College of Engineering wants to improve retention, they should get rid of the Entry-to-a-Major system. Entry-to-a-Major is the biggest reason why I changed my major out of engineering.) Secondly, I feel like only giving students one university studies degree would take away opportunities and flexibility for university studies students to take courses that they want.

---

The recommendation to consolidate into four large colleges is alarming and saddening. I desperately urge the university to reconsider the benefits of smaller colleges, particularly in regards to student retention and recruitment, faculty and student wellbeing, diversity, and research. As a geology student in the College of Geosciences, I speak for myself and my peers when I say this will remove the main reasons students come to A&M for geosciences. When searching for colleges in high school, I originally ruled out A&M out of fear of being swallowed up in a large school. Upon touring the campus, the familial culture of the College of Geosciences, the small class sizes, administrators who know you by name and are willing to bend over backwards to help all endeared the A&M to me. What was unthinkable became my first choice. Many of my peers chose A&M solely because of this. By removing this significant benefit, you will be losing a large portion of prospective students resulting in a lower overall caliber of student recruitment regardless of your efforts to better it. Now a senior, I love the College of Geosciences administrators and advisors, having been able to build personal relationships with them that the large colleges cannot boast. If we are merged, many of these stellar administrators will be laid off or overburdened by the addition of many times more students and a wide-even hodge-podge- collection of majors. We here in geosciences can trust our advisors to know us, our personal goals and struggles, and know they will do everything in their power to help. Not so in the other colleges. In the College of Engineering, for example, advisors do not even know the students faces and the relationship is stiff and cold. I have known many engineering majors struggle to get help in applying for classes, learning of resources etc. because their advisors are so overworked. Merging will only exacerbate the struggles of the larger colleges while dragging down the smaller. This lack of support will inevitably lead to higher dropout rates and mental health struggles. Students like me will feel more isolated, not less. We identify not just with the university as a whole, but as a college with its own unique culture that will be lost with a merge. This move will also harm diversity. It sounds counterintuitive at first, considering the College of Geosciences long struggle with diversity. I make this claim primarily in regards to scholarship. Geosciences is a college with lots of funding due to our important research and participation in IODP. We pull in well more than our

weight, especially compared to the arts. The college takes a significant amount of grant money brought in by professors to aid in scholarship and facility development. For our professors, it makes sense that this money is taken as it will be fed back to their own students and facilities. If it is shared with the liberal arts, which brings in much less money despite its larger size, the cut of money being fed back into researching, funding earning students in the College of Geosciences will be harshly reduced, resulting in a lasting decline in productivity and therefore income. Scholarship money is already spread thinly in our college as it is, and it is a significant help to those students who can get it, particularly minorities. If we merge with the Colleges of Liberal Arts and Sciences, our money will be redistributed away from us as we are a much smaller number, yet more prolific college. Our scholarships will be reduced further to accommodate this reduction, pushing poorer students and minorities away from the geosciences when we should be striving for the opposite. Additionally, the merge into a College of Arts and Sciences will hurt the image of our colleges. When I hear arts and sciences lumped together, the first thing that comes to mind is weak science. Is that what we want our university to represent? Prospective science and geoscience students want a college tailored to them and their needs. Think also of the college specific Living Learning Communities (LLC). These, specifically the Geosciences LLC as I was a member and peer mentor of it, strives to welcome students, give them a community of students with similar interests (the geosciences) and teach them things that are useful to know in their fields. An English major wants to learn aesthetic writing while a Meteorology major needs to unlearn that from high school and learn technical writing. Research, job searches, interviews, types of classes are all vastly different. LLCs are able to specially design their courses to best help their specific students. The LLCs and colleges know this and tailor their resources accordingly to best fit their students. This helps both the students and recruiters in promoting our familial image. Loss of high quality applicants could even lead to the loss of IODP, a major source of pride and income in the College of Geosciences and unique to us in the entire western hemisphere. Even risking its loss would be irredeemable damage to our image and recruitment. Art and science are both noble fields, but are too different to reasonably combine. One or the other will suffer as what is beneficial to the arts will harm the sciences and vice versa. Are such minimal benefits as the convenience of a few upper administrators really superior to the wellbeing of faculty, staff, and students? Has a single person wished their college was larger and less personal? I think not. There are other ways to insure consistency of values across the colleges without merging that will not result in lower enrollment, fewer scholarship opportunities, higher dropout rates, worse mental health and community. Reducing spending is no use if it results in an even larger loss of income. Because of my strong love for this college and university, I beg you to reconsider.

---

The integration of University Studies to the College of Arts and Sciences should not be accepted. The rationale that colleges should not essentially waste their time on those who are under-qualified or uninterested is completely wrong in my opinion. I am a University Studies Business major, and upon my acceptance to Mays, I was overqualified and very interested in my concentration. I have maintained a very high GPA of 3.8 and my career interests are heavily based in business. The design-your-own degree plan is an excellent concept that should be maintained, and it should remain seated in the college that the concentration lies.

---

I am writing this anonymously. I am a student in the Geophysics department. I DO NOT entertain the idea of merging the Geology and Geophysics college with others. An important reason for joining this college was due to its exclusivity and independence from other colleges in the University system. Faculty and staff are not only invested but thrilled to spend time with individual students which will not happen if we have a "centralized" Science and arts college. The disciplines extend much more than engineering and petroleum at Geology and Geophysics. If merged we'll be seen as an addition to the oil and gas industry, which just isn't the case.

---

To the head officials and coordinators of Texas A&M University, Hello- [REDACTED], a current first-year student in the Department of Visualization. This is a personal follow-up response to the Final Comprehensive Review Report conducted by MGT Consulting, which was released on October 19, 2021. This response will focus on the proposal in Recommendation #2, supported by Finding #2 and Rationale #2, starting on page 28, in the section titled Academic Realignment. I am in full support of the idea to relocate the Department of Visualization out of the College of Architecture umbrella and have it serve as the representative department for a new separate institution, which would house departments of the Visual and Performing Arts. The Visualization program is one of the more unique departments in the University, as it combines both fields of art and STEM. With a path that engages students to take courses in programming, drawing, design, and math/science throughout their undergraduate career, it bridges the gap between STEM and non-STEM, allowing students to specialize in something involving both creativity and logistics. In a sense, Visualization could be seen as an "all-in-one package deal" that allows students to engage with two very relevant fields in the modern era. Having this program that combines these two seemingly unrelated fields provides for vast career

opportunities that truly explore all parts of the art-STEM spectrum. This includes but is not limited to fields in Graphic Design, Web Development, Animation, Game Design/Development, Interactive Technology Development for Health and Education, and Even Data Analytics. With this super-inclusive education track, a student with this degree has the capability to be involved in any industry, especially with the ongoing digitization of our modern world. It would be inappropriate to simply weave a program with such capability under a specific college of study. Texas A&M Visualization is a renowned, globally recognized program, and there is so much potential for its continued growth. By staying under the College of Architecture, there are lots of limitations to this unique program. Such limitations would be regarding resources/facilities, building hours (which has been an ongoing situation), and department size. While this would clearly call for increased funding, I believe it is a necessary and well-beneficial decision to implement. Relocating the program from the Architecture "umbrella" would certainly lead to profound growth and capability. With how renowned the Visualization program already is under the College of Architecture, I believe that taking the next step and placing increased focus on our program could really maximize its potential and take it to unforeseen heights.

---

I do not support the merging of the college of liberal arts, geosciences, and science whatsoever. This will disadvantage these colleges and appears to serve no other reasoning than increasing the amount of money the university receives. I do not understand how this will increase research funding for smaller colleges, like the college of geoscience, since it is meant to benefit the arts. Texas A&M is a leading university in research in many areas, and to undermine that by combining the colleges does not seem productive. I feel that many students in these colleges will become lost in the massive influx of students and will not be able to receive the care and attention needed to complete their degree.

---

Stop wasting time on DEI initiatives and start spending it on bringing high achievers to campus, REGARDLESS of their race/class/gender/etc.

---

I am a HUGE advocate for the introduction of a journalism department. I know that the University Studies major is good for students who prefer to take the non-traditional route and "build their own major", but that is not what I think will be most useful in benefiting my career. As a University Studies major, specifying in journalism, I've found that it is very hard to find ways to get involved in on-campus opportunities/activities that are related to my field of study. Another suggestion I would have would be offering a Bachelor's of Science in Journalism. Communications majors can get their BS, and I would love the opportunity to do the same. Personally, I want to be a scientific journalist. I'm double minoring in two stem fields and plan to eventually get my masters. Expanding the course options in terms of science in journalism would be great as well. I know that TAMU currently offers classes that focus on communications in the healthcare system specifically, and I think branching out so that other fields of study that fall under the STEM umbrella can be covered in journalism/communications would be great. As much as I love TAMU, this is something that I have very seriously considered transferring colleges over, as I did not realize that I would be so limited in terms of resume building and/or career opportunities. I really hope that this feedback will be considered. I know that there is a very small number of journalism majors at this college, so there may not be as many people who advocate for this change, but it is something that I think would be extremely beneficial for both current students and ones to come.

---

I'm a student at the college of geosciences which I believe is part of the sciences college. We are underfunded as is, and I fear that the merging of sciences and liberal arts will push us further into the background. Our maps and equipment are outdated, our laboratories are old, and there's a shortage of faculty members. I am also nervous because geology is only sometimes considered a 'hard' science and a degree from the joint science and liberal arts college might not appeal to employers as much

---

This is a horrible idea as it would dilute the education of each department by making it part of a bigger college that will have broad degree requirements. If anything Colleges should become more decentralized and more tailored to the degrees they offer.

---

In regards to your proposal to combine the College of Geosciences in with other colleges to create a "TAMU College of Arts and Sciences", that is a huge mistake. As a current student, who had many options after high school when choosing which school to attend, one of the reasons I chose A&M over other Universities was because they had their own College of Geosciences. An independent colleges attracts the best students and the best teachers- everyone wants to be recognized. I can tell you with 100% certainty that if A&M did not have their own College of Geosciences, I would have gone to the Jackson School of Geosciences at the University of Texas. I guarantee that if you make this change, you will be losing great minds(from faculty and current students deciding to leave) and potential faculty, graduate students and undergraduate students writing A&M off as a university that can meet their needs. A small department like the College of Geosciences creates an environment where students feel supported and cared for- this of course increases the quality of life for your students and decreases suicide rates. A bigger college that encompasses several unrelated STEM and

Liberal Arts majors can only cause advising issues and make students feel small and irrelevant. This decision will affect where I chose to go to grad school, effectively ensuring that I will not be furthering my education at A&M. I can say the same for my peers as well.

The College of Geosciences should remain its own entity and not be absorbed into/combined with any existing college. To do so would be nonsensical and would diminish the prestige of the University to the many prospective and current students that come here solely for its geoscience programs.

For recommendation #3: focusing on print journalism in this day and age is a waste of time and money. Broadcast journalism, if we're considering only the internet, is probably where anyone, TAMU included, should focus their efforts. A correlation between low newspaper circulation and whatever fault doesn't establish causality or, if we assume causality, the direction of that causality. Newsroom and newspapers have lost their audiences due to polarizing behavior and outright deceptive practices, sure, but also because newer generations prefer digital sources over physical ones by a huge margin. Is that because those sources facilitate people who perform at a higher level than traditional journalists? Who knows but the migration from print to digital has been underway for a long time. I'm a millennial and I can't remember the last time I read a newspaper. The most visible information brokers, for better or worse, are on YouTube, Instagram, and Twitter. Even traditional print journalist host massive online audiences via their digital profiles (especially if we consider Twitter). It's become cliché but the best example I can think of is The Joe Rogan Experience on Spotify (formerly YouTube): 11.2 million subscribers on YouTube and it accounted for 5% of Spotify's audience when it started producing content their last September. This is a podcast that uses nothing but long-form discussions (>2 hours in length) and it has more listeners than Fox News and CNN has viewers, combined. Journalism can be revived but that doesn't mean it's going to look the way it did. Carrier pigeons and telegrams died out when they were replaced by better technology. There's no reason to believe the same won't happen to print, radio, and television media in turn. If TAMU wants to make people better at consuming media, they should focus on making people better at consuming all media, with a strong emphasis on digital; if they want to revitalize modern journalism and make their journalists current with the times, they should focus on making better YouTube content creators.

I believe the College of Geoscience should remain in its own specific college. This is a very critical area for many students here at TAMU, and as global crises involving geosciences (geo-engineering adaptation methods for problems associated with climate change for example) become more critical, I think it's very important to have a strong focus in this area for upcoming students. Combining the Liberal Arts and Geosciences college would do neither of the colleges justice for the varied work that happens in both of them. I also believe that these two departments just do not mesh well in terms of curriculum and therefore should not be grouped together. Both colleges would best benefit from having their own specific advisors, staff, instructors, etc suited to their respective subject areas.

As a student currently in the College of Liberal Arts, I think merging with the College of Science and Geosciences will be beneficial! Many students get confused by "Liberal Arts" and think it won't be as effective of a college to be in simply because it is not necessarily a STEM focused college. However, as a bachelor of science in Psychology, I know this is not the case, as I have had an extensive education in science related courses. I also think the suggestion of moving General Studies into this new College of Arts and Sciences will also be a great change since many students who are in between majors find it difficult to meet with advisors and ensure they are still taking the necessary courses for graduation.

I like the biological institute idea, especially considering how similar my curriculum is to my BIMS counterparts and how frustrated we all are with courses not being equivalent. I fail to see the benefit of combining the college of science and geosciences with the COLA, aside from conforming to what others do.

You must not move the Department of Construction Science into the College of Engineering. We are not engineers. This move would be detrimental to the future students of Texas A&M Construction Science. Engineering does their admissions and applications for majors in a way that I believe would be very harmful if applied to Construction Science. Funneling design students into a non-design construction science program because they did not perform well enough to get the engineering major they wanted is not a recipe to keep the #1 construction science program in the nation the #1 construction science program in the nation. I would find it hard to believe that the Department of Construction Science, if apart of the College of Engineering, would be viewed and treated equally amongst the other genuine engineering departments. This would be the detriment of the students of Construction Science and the industry as a whole. The Texas A&M Department of Construction Science is the greatest in the nation. It should not be punished for the shortcomings of the College of Architecture. If any change should be made, I propose that The Department of Construction Science become the College of Construction Science as its own independent college within Texas A&M University just as is proposed with the Department of Visualization. What we study and do professionally is entirely

unique. Our profession and work is often misunderstood by architects and, especially, engineers. Additionally, stronger advocacy for liberal arts education by lumping STEM focused majors and Liberal Art majors would be a hindrance to the concept of specialization and excellence within those STEM majors and Liberal Art majors. Having students think more alike rather than think differently by combining fields of study is the antithesis of diversity of thought that leads to so many great and different perspectives. There are only so many classes a student can take before they graduate. Why one would want to decrease specialization and thus excellence within their field of study I do not know. I vehemently disagree with the consulting firm's exposition on what the Arts do for non art focused studies. The consulting firm references other universities and institutions as if what is popular is indeed what is good; that is fallacious and shouldn't be considered when crafting policy. People largely do not come to A&M because it is a better version of every other university, but rather because it shines in contrast to every other university.

---

I do not think the colleges of geosciences, liberal arts, and sciences should be merged.

---

Do not combine College of Geosciences into school of arts. These majors belonging to Geoscience is a close group of people and classes that can be intertwined. For instance Meteorology majors minoring in oceanography. Also the college of Geosciences has a set of clubs for all the majors in our programs and keep smaller majors together and do not want to be lumped into one massive college with conflicting majors that do not correlate with each other. For example, arts majors have nothing to do with geosciences nor do they share interests. You would be forcing funding splits among two colleges that do not correlate.

---

I don't think combining the liberal arts college and the college of science is necessary. Each college offers different degrees and different requirements. In separate colleges, faculty would be able to cater to the needs of the students in their respective colleges. I think instead of merging, putting more focus into the liberal arts would be better than combining it with the STEM majors. My peers have mentioned that A&M combining colleges seems like the university is trying to get rid of the arts, rather than emphasizing them. The report also mentions the creation of new colleges, which are much needed, however, the combining of liberal arts and science does not seem necessary and would just cause further confusion.

---

Combining colleges into the College of Arts and Sciences is a positive and welcome change. Though if the university creates a college of visual and performing arts, then the college of arts and sciences should just be the college of sciences because an existing college for the arts would already exist concurrently. A department of journalism is entirely unnecessary. The libraries should remain unattached to any college.

---

I'm concerned on what this will mean for students. For Vetmed and Bims students that are being combined with bio, where will some classes be held? At Vidi or at the biology building on main campus? These colleges are very far apart on campus and this will definitely result in student having to commute more than ever to get to classes. Also if we are going to combine these to become a life science college shouldn't other majors be added as well? I also don't think Liberal Arts should be combined with Science. They have no relation to each other, other than the new Stem word alternative Steam, which should not be used as stem was invented to help increase the importance of science majors in the future and Steam was invented as liberal arts colleges felt left out. They are not equal choices and should remain separate. If you do create new departments such as journalism then that should let liberal arts feel that they are still getting new updated changes and more students.

---

I genuinely don't think it's a good idea to combine 3 colleges, considering these three have pretty much nothing to do with each other it's awkward placement. I as a student also fear that I will not get a time to meet with an advisor who knows me, my schedule, and will actually help me in the areas that I struggle in. It's already hard to get an advising appointment with my advisor and adding 2 more while colleges to the mix doesn't seem like the best idea.

---

I believe that the report is unclear on what will happen to the political science department and the students who are in it. I am strongly against the making university studies a liberal arts degree, especially how it was worded in the report. The liberal arts college should not be the only college to "hold the burden" of these students. Merging colleges is something that is wildly unpopular among students especially in the college of geoscience

---

I sincerely only have objections to the recommendations made in this one category. There are several departments within the Colleges of Science and Geosciences which already receive the bare bones in funding compared to our bigger name programs like Engineering. Meteorology is the first that comes to mind. Despite being one of the top three programs in the country it seems like this major is ignored habitually when it comes to funding and advancement. Merging the College of Geosciences with the College of Liberal Arts gives the impression that the Geosciences majors are not seen as relevant to the university (this is especially disturbing as many of the students in these majors already feel

that way). It looks like they are being brushed to the side again. This objection noted, I am ecstatic that a shift in focus is being considered for the vet school. As a pre-vet biomedical sciences student, I have noticed that in recent years clinical practice has been less and less of a priority. Fostering the education of prepared veterinarians and bettering bettering clinical practices as a whole should be the primary focus of the vet school with everything else coming as a supplement or extension of that. The fact that we no longer have an actual exotics department is quite frankly embarrassing given our history and reputation compared to other veterinary schools, and it is my hope that a refocus on actual practice might lead to a re-establishment of this program.

I think that moving the Department of Construction Science to the College of Engineering would be a disservice to us students and the Department as a whole. As a Construction Science major I personally do not see myself as an Engineer but as a Construction Professional. As a Construction Professional we collaborate with Professional Engineers and Certified Architects making it 3 different professionals working towards a common goal. If the Department of Construction Science were moved to the College of Engineering, I think that material will begin to merge and overload the Construction Professional with information that is more related to the design process whereas our line of work is more related to the actual construction.

As a student in the College of Geosciences, I disagree with the combining of the College of Liberal Arts, the College of Sciences, and the College of Geosciences. Although we are small, our faculty and staff more than make up for it with the connections formed. If we were to be swallowed into a larger college, that would be harder to come by. We pride ourselves on being the smallest college with the most funding at A&M. Our majors are already hard enough for people to find at TAMU - burying them in a large college will make it worse. This won't heighten liberal arts awareness - everyone already knows about it. It's literally a bigger college than the other two combined. If the concern is actually advising and curriculum, add more faculty for the larger colleges. There is no reason as to why colleges that are much bigger can handle their student's schedules and a smaller college can't. Add the resources necessary.

As a student in the College of Science, I am in very much in favor of combining the College of Science, College of Liberal Arts, and College of Geosciences into one College of Arts and Sciences. I've believed that those colleges have needed to be under one college ever since I came to A&M.

I am a Construction Science student and I do NOT want my program to be moved to the College of Engineering.

None

I think dissolving the community health program is a must, since it is confusing when discussing it vs the community health program. Also is unfair that the classes are all basically the same, but public health has less class offerings than dept of health and human edu. Also like the fact that dissolving the college of science, since the dept of chemistry has gotten extremely out of hand and is not well organized whatsoever. Many undergrads are always very unhappy with their lab education, especially in the dept of Chem. Also think research for tamu health would be extremely beneficial to the university, especially with such a large demand for doctors.

I like the idea of a music/performing arts college and the consolidation into a college of arts and sciences. I do not agree that CoSci should be housed in engineering. Also, adding PoliSci into the Bush School will only diminish the bush school and graduates of the program. PoliSci should stay in with liberal arts or have it separate and add journalism into PoliSci or into the A&S college.

Provide more German language courses and continue the add/drop

Combining the college of sciences and liberal arts diminishes the accomplishments of the college of geosciences and the individuality of the program. These programs are better off on their own.

I'm not sure making a bunch of mega-colleges is gonna work out well. College of engineering is already a fiasco, and you want to repeat that? I'm good with geosciences being absorbed, but not sure there needs to be a science, liberal arts, geosciences college all tied in one. Also why are we adding the library to the next mega college, they do fine on their own. Get rid of the university studies degree entirely - it cheapens the value of the degrees of people who actually got that degree. GIST university studies is a joke class-wise, and they get to say they have a degree in GIS.

The department of Geology and Geophysics is much more qualified, due to the required curriculum, to be considered part of the College of Engineering. Rather than be lumped with a college of arts and sciences. The math, physics, and chemistry courses required of Geology students are engineering math, physics, and chemistry courses. Geophysics degrees have to take higher level math than engineering students. It would undermine the level education that

Geology and Geophysics students have obtained during their time at Texas A&M to put them in a college of arts and sciences. It would be more appropriate to relocate the Department of Geology and Geophysics to the College of Engineering, due to the fact that we take engineering courses already.

---

You should not combine anything

---

I do not believe that the Bush School should be merged with the POLS department at TAMU. The Bush School as it stands is filled with its own traditions as well as a supportive and attentive staff. We have respectful and productive conversations about real world scenarios everyday and have a cohort that is bonded together like no other. We strive for better. We represent the Bush Legacy. Personally, I do not believe that merging is the best fit for the school. While merging undergraduates is great for the political science department, the reputation of the Bush School could suffer. Freshman in introductory POLS classes are not mature enough to handle conversation about controversial topics. In addition, many do not have an interest for public service as we do. That's why we came to graduate school. We already know this is where we want to be. I could not imagine paying the amount of tuition I do for graduate level resources, just to end up sharing them with undergraduates. If the issue is students not knowing about the program, then it should be marketed better. Spoken about more. The answer does not lay in merging the programs, but letting Bushiest represent the school and letting time tell where the program will go.

---

I think the Construction Science courses do align more with Engineering as they are learning the structure of buildings and it would allow them to gain a PE license which could just further their career in the construction industry. I also loved the emphasis on the Bush school being more involved with Political Science. I personally never knew much about it, but would see some neat opportunities every now and then about working in DC at the capitol and getting those types of experiences. I definitely think more awareness about the school and opportunity could be great for students. Especially with politics being so biased and unclear these days, it could be a great opportunity to pour knowledge into Aggies with the core values of the university going into politics later in life. I think it is more important than ever to have ethical candidates understand what's actually happening behind the curtain. I scanned the rest of the document but these were the main things that stuck out to me.

---

I don't agree with the merging of arts and sciences. As an engineering university, these colleges should stand apart and be distinct. The complexity of merging them will incur the loss of identities and strengths. I agree with the visual and performing arts. Many students have wanted a school of this nature. The Aggie Band as a major Unit of the Corps of Cadets requires that member be a Corps Member. Something would need to be created to allow music degrees to either not have march band or require the members be in the corps. To have a member that is not a Corps Member to march in a uniform is a disgrace to the ROTC and military roots and compliance. Department of Journalism- interesting given the change more than 10 years ago involving journalism.

---

As a BIMS major, I wholly disagree with moving Biomedical Sciences into an "Institute of Biological Life Sciences" and the concept that the small animal program needs more attention. I am also in disagreement with the suggestions of combining the Colleges of Liberal Arts, Sciences, and Geosciences into a new College of Arts and Sciences, and consolidating the libraries under that college. BIMS is a major that offers such a broad range of classes and opportunities that it cannot be put under any one umbrella. To say it belongs with Animal Science, Biology, Chemistry, or Health would all be correct. Placing it in one of those categories could be misleading to the students wishing to pursue a wide range of careers with a BIMS degree. While I understand the logic behind wanting to offer a general biology degree to give students a chance to hone in on their preferred field, BIMS already achieves this. The first two years are largely spent completing CBKs and beginning to explore the directed electives BIMS offers, before taking a more streamlined approach in the junior and senior years in relation to the directed electives. I myself was exposed to a wide variety of classes from Great Diseases of the World to Entomology in my first two years at A&M that helped me to narrow down to Toxicology, Pharmacology, and Immunology, among others, for my final semesters. Where Vet Med is considered, the idea that there is a "strong demand for small animal veterinarians" - while not wrong - should be trumped by the dire need for large animal veterinarians. Most anyone in CVM would likely relay that, while there is a need for both, large animal vets are much fewer and far between. While the small animal hospital is certainly in need of renovations, I believe some of that money should also be directed towards the large animal program. The consolidation of Liberal Arts, Sciences, and Geosciences would also cause much confusion and likely make it even more difficult for students to decipher what courses are required of them. As the membership card to Museum of Fine Arts Houston in my wallet and the season tickets my family often holds to Theater Under The Stars proves, I am an appreciator of the arts. As such, I am in agreement with the fact that the arts can and do often get lost at science oriented universities, however, I don't

believe the answer is to consolidate arts and sciences. Simply updating university required courses to include more hours of arts courses would be an easier way to ensure that students are being exposed to other subjects. I am just as opposed to the idea of moving all the libraries under this umbrella. I am not against librarians being given faculty status or the opportunity for tenure, but I believe that consolidating all the libraries under one college could be divisive and make them less available to other students. Just as how the Medical Science Library is meant for a certain bracket of students, classifying the libraries under a specific college could make it seem as though they are intended for the use of that college.

---

N/A

---

I agree that the various biology tracks needed to be consolidated and I somewhat agree they should be moved under one college. That college should be the college of science, not the college of agriculture. Putting biology and bio/bio into the college of ag will cripple them. It will be impossible to recruit competitive synthetic biology, structural biology, chemical biology, and computational biology grad students, post-docs, and professors into an Ag department. I have experienced this first hand, as a member of a biology lab in an ag related field. If the intention is to remove biology and biochemistry as a priority, that's fine, but this will add a large structural barrier to success for those departments.

---

The College of Geosciences has given me so many great opportunities that are unique due to its small size and close knit faculty and students. If we are combined with other colleges on campus, I am certain that I would not have been as successful in my internships, experiences, student organizations, or academics. If this realignment occurred before I was a student, I would definitely have chosen another university. The college of arts and sciences is a mistake.

---

I kindly prompt you to accept all recommendations. Your office ought to improve.

---

You should not move the college of geosciences with the liberal arts college and the college of science. Keep them separated. If you want to move any department, move geology and geophysics to the engineering department. They take the same math, physics and chemistry courses. Moving geosciences does nothing but partner them up with completely unrelated majors.

---

In terms of the changes toward the Department of Visualization, I believe that the changes would overall be for the better of the program, but it should focus on keeping the core technical work that is central to the Department over making it too focused on the artistic side of the Department. Visualization is best when it's focused on both parts of the field and not leaning too heavily on one side or the other.

---

I feel like too often I have had bad professors. Bad professors who do not care about the success of their students because they either don't care about teaching the class because they're doing research, or because they make money off of textbooks. I recall what I had heard from my professor [REDACTED] who taught pols 206, where he said it doesn't matter to him, and he doesn't care what our grades are, because he already makes money off of the textbook he wrote and made required for the class. My current professor for mgmt 209, [REDACTED] is another bad professor. He does not teach any material or do any work that I am knowledgeable of. The class is just consistent of old videos and powerpoints that we have to do by ourselves. This is an intro to law class. It is one of the hardest ones at the university according to students. So why do we have a teacher teaching it who doesn't care. He doesn't listen fo his students, because he doesn't care. He made his tests on a very inconvenient time, friday at 5 pm, and over half of the student body in his classes asked if we could change it to a more convenient time for everyone. His response was, he didn't care, he set the time so we had to be subject to it. He then proceeded to mess up the entire test due to lack of knowledge of technology and sent out this long email asking for "understanding", which upset me insanely after a whole semester of him not accepting and understanding his whole student body. I have seen on so many forums, that he is the worst professor, his class is so hard, don't take it under any circumstances. And the fact that it's that way in the first place, and he has refused to change after so long is very concerning. The faculty of this school is full of super old white guys who honestly couldn't give less of a care in the world what happens in their classes. So I pose the question. WHY ARE THEY PROFESSORS. The idea of professors coming to university to do research and teach on the side is so outdated. Why not just let them do what they want, and just not let them teach? Because students drastically suffer from bad professors, and flourish from professors that care and put in the effort. This is such a large problem, and it's so important to me because this is the stuff I'm learning, and need to learn to not only get my degree so I can get a job, but also to apply to myself and my job in the future so I can be the best professional. How can we pride ourselves on academics and still have this massive professor problem. If A&M truly cared about academics and it's students success, then you would listen to me, and the countless of others who have cried out for help, but all we have heard so far is silence.

Most recommendations seem obvious, and I do not know why we were not doing this before.

Laughably absurd. Scrap the plan to "Combine the College of Liberal Arts, the College of Science, and the College of Geosciences". Each college should remain separate as is, since each college has a unique identity and value proposition, both of which would be immediately lost if consolidated into a bloated "mega-college" of little use and value to the university, other than to house an inflated number of students under one umbrella.

I strongly disagree with merging the college of geoscience with the college of science and liberal arts. Merging the college would diminish the unique identity of students within the college of geoscience. We already struggle to be seen as a small college, I can't see how making us part of a larger college would help. The college of geoscience is already an amazing college, I don't see how merging it with majors that are completely unrelated would help.

I am strongly apposed to the addition of the College of Geosciences into the College of Liberal Arts and Sciences. I feel it would invalidate the rigor of my degree as a geology major, which is much more comparable to a degree received from the College of Engineering as opposed to a degree from the College of Arts and Sciences. Were this realignment to occur, I would most likely apply to change majors and move into Petroleum Engineering. I feel that were a realignment to occur, moving the Department of Geology and Geophysics into the College of Engineering would be more acceptable.

I'm a political science major, and I think that my educational experience would benefit from being absorbed by the Bush School. If TAMU decides to follow through with the reports recommendation to elevate the Bush School to a more visible role on campus, I will be exposed to more exciting opportunities within my field of study. If the Department of Political Science remains within the College of Liberal Arts, I think it would give us a larger voice if we merged with the College of Science like the report recommends. I am more in favor of the POLS Department joining an elevated Bush School.

The reason why I came to Texas A&M instead of other universities which offered me more financial aid was based on the uniqueness of a College of Geosciences. I worry that combining this college with others, who are not even remotely similar to geosciences, will result in confusion and that many of the programs within the college right now will be overshadowed.

While I understand the reasons they want to combine the college of Geosciences with Liberal Arts and Sciences, I have reservations about the potential impacts to quality as a result. The College of Geosciences offers a focused experience with professors and advisors who know what we as students need and consolidating the College with others and eliminating overhead could damage that. With those impacts in mind I can't condone this move, not without some compelling evidence that there would be concrete benefit to geoscience students. There was no evidence of concrete benefits to geosciences students in the report.

The idea of combining the school of geosciences with another school to increase funding isn't the worst idea, but combining with the school of arts doesn't make sense. And while i agree that arts are useful/important, i disagree that our university needs to make these changes to promote liberal arts simply because they're underrepresented here. This is a top-tier STEM school that also already has successful and respected arts programs. I don't see the need to cater more towards that side of things when they already receive better funding than geosciences, especially when you consider that A&M is one of the most prominent and highest ranked Meteorology schools in the nation, and even the world. If you'd really want to dissolve/relocate Geosciences in order to receive better funding, then make certain majors a division of the school of engineering, or just the school of sciences. Or the University should simply divert more money towards our school and promote it better as one of the foremost schools of geosciences in the nation. A&M geosciences/meteorology already has an incredible reputation, so any concentrated efforts towards better promotion would do wonders towards bringing in new students and better funding. While i don't want to go so far as to say that being associated with the arts would degrade the value of a STEM degree here, i do think that this proposed combination would do more harm than good from a reputational standpoint, especially when you consider the demographic of a lot of people within the state, and their viewpoints towards the arts. Overall, i believe that the College of Geosciences here at A&M has earned better treatment from the university than what we have received, and deserve to either be promoted/funded better as our own school, or we at least deserve to simply be combined with/moved under a more opportunistic place such as the College of Engineering.

The College of Geosciences SHOULD NOT be combined into the new college of sciences and arts. The current structure should be left as is.

I am a part of the College of Geosciences. It has been an important part of our identity. The combination of multiple arts and science colleges into one is artificial and will only serve to divide the focus of the dean and college-level faculty,

taking attention away from student success in their chosen area of expertise. The rationale given seems largely to make Texas A&M more like other institutions, and to be able to gloat about how large its Arts & Sciences are. I disagree strongly with this perspective, and the perspective of a need for four distinct "legs" of the university's "stool" is artificial and outdated. It ignores the cost of focus for the students, faculty, and staff at all levels, and suggests that those who drafted the report are administratively astute but are ignorant of what these colleges represent and how their fields operate nationally and internationally. Arts do not operate like the sciences. If there were a merging, it should be between the colleges of Science and Geoscience.

---

The suggestion of a College of performing arts and a venue to use is absolutely brilliant. So is the suggestion of a museum.

---

I'm a meteorology major in the college of Geosciences and I think it's completely unfair to lump it with the college of arts. We take the same sciences/math if not more than the college of engineering so if anything we at least deserve to be put in the college of sciences. Putting a STEM based college with arts makes absolutely no sense and will overall degrade the amount of effort put into this major. Please think this through

---

Combining the three smaller colleges into one larger College of Arts and Sciences takes away all the benefits of being in a smaller college that many students in the smaller colleges enjoy. Especially when you consider all of the issues the College of Engineering has of students not being able to get into required classes, forcing them to be behind a semester because departments are not offering enough seats (for example, what happened to Aerospace Engineering sophomores for Fall 2021.) If having big colleges is already failing, why would you try to create more of them? Every College of Engineering student I know expresses frustration and unhappiness with how big their college is and all of the resources they can not get because of it, compared to people in smaller colleges who have resources to more scholarships, more research opportunities, and smaller class sizes. The entire selling point of the College of Geosciences is that it offers the benefits of attending a small university due to its' size, while still being able to attend Texas A&M University.

---

As a student in the College of Geosciences (Meteorology Major), I believe that the realignment of combining Liberal Arts with Science and with Geoscience would be an incredible mistake. I am here for a degree in Meteorology and I would greatly appreciate not being stuck with Liberal Arts. I am not here to be associated with Liberal Arts. I am here for a STEM degree. For many geoscience/ science majors, this would feel as though our degree means less. Not to say Liberal Arts is not important, but it is absolutely not what I am here for. Need more money for these three colleges? Maybe consider giving a little less money to sports and engineering and give something to other departments. The meteorology program at TAMU is currently number one in the entire country. But you'd hardly know that because all we ever hear about is engineering and sports. Your entire realignment talks about what this can do for Liberal Arts. What about Science and Geoscience? We already get almost no recognition and this is just trying to make it worse. Again, top meteorology program in the country, in case you weren't aware. If I were an incoming student, I would feel concerned by the fact that Meteorology was combined with Liberal Arts. The way we are set up right now, sets us apart from other universities. This allows us to have our own space and our own people. And if this is something you're doing, maybe we should have engineering join science and geoscience and make one big science department. Stop making engineering the most important thing. Want to realign? Do something that actually makes sense. Instead of forcing a Meteorology major to have their diploma say Liberal Arts because that is one way to make us feel incredibly unimportant and devalued. Find a different way to help out the Liberal Arts program without harming others. Because this is unacceptable.

---

Even if combining these colleges would save money, each college has very different objectives and values. A merger could lead to a bureaucratic organization/leadership, conflicts between monetary distribution and uses between the colleges, and would not be desired by many students. The liberal arts majors and geosciences majors specifically have very little in common (one being focused on soft sciences and non-STEM related subjects and one being almost exclusively STEM-based). I'm not quite sure how a merger between these colleges would provide significant benefit. Furthermore, if a geoscience or science student graduated from a college of art and sciences opposed to a specialized college for sciences or geosciences, their job opportunities may be impeded due to a perception of a lack of STEM-based proficiency/specialty.

---

I believe it would not be beneficial to combine the college of liberal arts, sciences, and geosciences. If I were a high school senior and was wanting to go to university for geoscience, having the official college of my program be College of Arts and Sciences would deter me from picking A&M. Combining these schools feels like a dismissal of the individuality of each of their programs.

YES! Coming from a larger college, I feel there are many resources and opportunities that get dispersed. Centralization

I believe that TAMU should extend its development to the arts. Visualization is an especially good example. Despite the departments renown, the small size and limited space/funding restricts the departments growth. Separating Visualization from Architecture could allow the department to grow and grant TAMU a better reputation with the arts.

I am currently a Bush School student and have a comment regarding Recommendation #4, to merge the Bush school with the Department of Political Science. I am concerned that this would change the uniqueness of the Bush school by integrating undergraduate students and students in other departments. Currently, there are students in the 3+2 program that can take classes as seniors in the Bush school. This provides some overlap between the undergraduate program and the Bush school's graduate program. One of the things I appreciate and was a chief reason I came to the program was that it consisted of solely master's students which creates a unique classroom atmosphere. The idea of bringing in undergraduate students may take away from the ripe and constructive learning environment we have at the school. All clubs and outside organizations consist of solely master's students which makes it very unique and allows us to learn from like-minded people in the same career timeline as each other. Merging the two departments will streamline resources but will take away the unique learning environment we have at the school because we are with peers on the same career trajectory and timeline. The reason I came to this program and school was to be surrounded by peers of similar ages and career timelines and the inclusion of undergraduate students may deter the focus of the master's program.

I have questions about how Liberal Arts and Sciences will be combined. As a graduate student, my current stipend is set by the Liberal Arts administration. With a potential merger, I fear my humanities stipend will be decreased, while sciences will increase. I think if these schools are combined, PhD stipends need to be standardised across departments. I know chemistry and physics students who make 2.5 times what I make and I find this extremely detrimental to the college as a whole. If the colleges were combined, I would need assurance that treatment of humanities and social sciences would not suffer compared to geosciences and other hard sciences.

As a student in the college of geosciences it seems fairly wrong in order to combine the college of sciences, geosciences, and arts. The degree plan associated with these majors aligns more with the school of engineering if anything. Also combining the schools would lead to a decrease in funding for not only the geosciences, but also the sciences as a result of having 'arts' in the name. I'm not trying to be biased, but financially less money would come into the school! The school of geosciences already doesn't get enough money as it is and pooling the money between the 3 schools would not go well. With enough supplemental data I could strengthen my case. Overall, it is unanimous amongst my peers in the geosciences and those who have peers in the college of arts all agree that combining the schools would do more harm than good to the efficiency of spending and damage the income to the University.

This appears to be a good solution to unify the smaller colleges. However, it is only worth considering if it increases the budget for research in these colleges. Currently, graduate student assistants in these colleges are compensated poorly for their work.

Regarding recommendation #4, Elevate and expand the Bush School of Government and Public Service to be a highly visible and accessible part of the university portfolio through significant investment and a merger with the Department of Political Science, I would like to say that I am decidedly opposed to this recommendation as a current Bush School student. The Bush School has cultivated a unique culture and element of academic rigor that is not equally present in the undergraduate students of the political science department. One simply needs to walk through the building to see the stark difference. Integrating Bush into the political science department will inevitably lead to a lowest common denominator, where the students cease dressing in business professional clothing, emphasizing experiential learning, and interacting frequently with important persons around the world from policy and academia. Bush's separateness is one of the main draws for the program, and arguably, all the best International Affairs masters programs around the country keep distance from their undergraduate institutions. There is a level of maturity and seriousness that most undergraduate students lack, often to no fault of their own. The graduate students should not be punished for that. Further, the addition of PhD programs is antithetical to the core value of the school. The Bush School is entirely geared toward sending students into public service, as the late President wanted. PhDs, while valuable, are a different beast. What makes Bush competitive with so many high ranking master's programs in the country is that is filled almost exclusively with practitioners. PhD students do not come to learn from practitioners, they come to learn from academics. If Bush is overrun with academics, it loses its unique and competitive element with other masters programs that it will never outrank. We can't beat Fletcher or Kennedy in terms of academics. It will never happen. We can bring

in more experienced and important professionals than they'll ever get, and ensure that students have constant access to them unlike night schools in DC, though. That's how we compete. The political science program could have its own PhD program, separate from Bush, if that expansion is truly necessary. Bush's separateness from the rest of Texas A&M is another key reason that I chose it. Frankly, 70k students is too many. This university is massive, daunting, and 90% of it is useless to me as a masters student. My specific school being close knit and separate makes the experience special, accessible, and it keeps me out of massively sized classes where I don't get to know the professors (who are the reason I came here). I do agree, though, that Bush should be better known on campus. More and also effective advertising is a better solution than rolling it into a different department. Personally, I think it is a mark of success that most of the cohort is not from Texas A&M. If most of your recruiting is coming from your undergraduates instead of the rest of the country, your program isn't good, it's just an easy choice. It also leads to significantly more diversity both in terms of the education and experiences that students have had prior to getting here and in literal terms of diversity such as protected classes of people. If you want to fundamentally change what the Bush School is, then a merger makes sense. But if the unique vision and benefits that Bush provides are important, and I think they are, then consider alternative solutions.

---

The realignment to create the College of Arts and Sciences is fantastic. I think combining these currently separated colleges will allow the students to feel like they are part of something important at the University. Currently it feels like Engineering, Business, and AG are more important than everything else and I don't necessarily think that is a bad thing. But combining three separate colleges and hopefully giving them the facility and numbers to be impactful will help many more students feel like they are part of one of the premier colleges at TAMU. Hopefully you keep ECON in with the Arts and Sciences. Don't move it over to Bush.

---

The appeal of Texas A&M personally came from the fact that we have a college of geosciences. If the college is dissolved or merged into another, this would take away the appeal to many like-minded incoming students who want a holistic geosciences education. Please don't do this.

---

I am against realignment which would put science and arts together. The needs of a chemistry differ significantly from the needs of a historian. While the report suggests this would be a streamlining move, I think that lumping together too many dissimilar departments will actually increase inefficiency in practice as students, faculty and staff with no significant professional connections will be forced into the same grouping.

---

The new Institute of Biological Life Sciences should have some collaboration or overlap with the Biomedical Engineering and Agricultural and Biological Engineering departments as these have active collaborations and faculty and student applicants to both institutes typically have overlapping interests.

---

As someone who spent two years in the College of Geoscience, and has now transferred to the College of Liberal Arts, I think the new academic realignment recommendation #1 does not make sense. When I was in my first college/department, I really enjoyed its specific programs and faculty that were unique to the college. It made me more motivated to buy "College of Geoscience" merchandise, and speak to different advisors in the department. Not to mention the course-load for this college is very different from those in the College of Liberal Arts, College of Science, etc. It would not be a smart change to intertwine all these departments and confuse students, especially when it comes to finding advisors or specific degree information. Now that I am in the College of Liberal Arts, I was so excited to get connected with this college and even join the Liberal Arts Student Council Organization. A club that can really connect me to my specific major and department. I believe the structure A&M has now is the most beneficial to faculty, staff and students. It makes students feel like they have a close-knit community, and encourages them to get involved with their school. A&M is a school that prides themselves on "tradition," but this major change would contradict that.

---

Change the way you teach students, tests are not that important, they don't benefit any of the students they just help the school get ranked and get results. Maybe it is time to start developing classes to be more appropriate for the 21st century and not the 20th century. Times have changed, the way classes are being taught needs to change. That is the academic realignment that is needed, not combining departments.

---

I agree that something should be done to increase education in the arts on campus and agree wholeheartedly with recommendations 1 and 2. This will draw more students that previously have not been students because of the lack of programs for their specific fields of interest. As a political science major, I also agree with recommendation 4.

---

Just remember you are representing the Texas A&M University, you have to adhere to the values, ethics and views of the University's current students and Alumni. Not the other way around. You're not representing the University of Texas or any of their systems

## Academic Realignment - Former Student

Please provide your comments related to Academic Realignment:

---

I disagree with the idea of moving Construction Science out of the College of Architecture. While I was not in the University Studies program in the College of Architecture, I had the privilege of going on study abroad with many of those students during one of my summer semesters. The USAR program is an absolutely fantastic program. It is essentially a "discount" construction science program. The students who go into that program on average only make a few thousand dollars less than construction science students. I think that is a fantastic opportunity provided to kids who otherwise may have ended up doing something they didn't like with less market value because they couldn't get into the Construction Science program. Moving Construction Science to the College of Engineering will undoubtedly make it much harder to get into Construction Science to start with. Then, on top of that, who knows what will come of the USAR program. The College of Engineering is generally much less nice to those students who could not make it into their programs. I think moving the Construction Science department to the College of Engineering would be devastating for the USAR program, possibly one of the best programs in at TAMU.

---

What oh why would you put arts and science together??? Makes no sense at all. I have a liberal arts degree (psychology). Being swallowed up by science would NOT be beneficial! I really believe this poses more harm to both schools. And if you're going to have a school of performing ARTS maybe that should be with the liberal ARTS college. You know, the people who are reading and writing the plays could be with the ones bringing the art to life. I also believe that architecture would be negatively impacted by being combined with engineering. It seems like this 'bigger is better' model may be good for the staff, but it loses sight of the student. As a student and now a parent of three students, the smaller community of separate colleges is vital for student engagement and success. The university is big enough as it is. Finding a smaller home within a college is important. This plan takes that away from the students. The College of Geosciences is one of the best in the country and could be completely lost in a bigger combined college. It seems that a good part of the rationale here is 'lots of other schools are doing it.' Since when does TAMU desire to settle for being like others. Let's continue to be set apart and different. Let's allow this smaller college homes to have a narrower and specific focus on doing the things in each college to guide those particular students to academic and future success.

---

The relocation of Construction Science to the College of Engineering is of significant concern to me. As a graduate of the Building Construction program, founding member and past president of its Construction Industry Advisory Council and consumer of the product it produces for many years I am very concerned about the fit with engineering. What we do is very different than the process of engineering and is all about practical application and growth and leadership of people. This is not the focus of engineering disciplines or the teaching of engineering. As an industry we benefit significantly from being able to hire young professionals that have been taught by extremely experienced industry professionals with many years of hands on experience. Our concern is that this will be lost in the proposed move.

---

I strongly urge you not to follow the proposal for academic realignment. Increasing the visibility and scope of the College of Liberal Arts can surely be accomplished in a way that is not at the expense of the College of Science and the College of Geosciences.

---

Texas A&M has a strong STEM basis which includes a strong College of Science. I do not think that combining Liberal Arts and Science will be good for STEM education. From reading the report, it sounds like they are recommending using the strong science basis to try to increase Liberal Arts. We need to use the strong basis in science to continue to strengthen our science departments. As the report pointed out, there are several state school options for students interested in liberal arts and performing arts. I do not think it is in the best interest of Texas A&M to try to play "catch-up" to other institutions in this area. Texas A&M is strong in the areas that focus on STEM and should continue to focus in these areas. Everything points to STEM being the future to solve issues facing the country and the world. We should focus and build on our strengths. Also, Biology should remain in the College of Science. Biology does impact AgriLife, but it also impacts Health Sciences and Veterinary Sciences. If it is moved to AgriLife, it would limit its impact because that would become the focus of biology. It would be better to identify the various biology courses in the various colleges and move them all to the Department of Biology in the College of Science. Again, this would help to strengthen biology not weaken it by limiting its focus to just one area. I agree that the College of Geosciences is a small

college and should be combined with another college to help with overhead costs. From reviewing the degree programs offered, it does appear that the College of Science would be place to move the geoscience degrees. I do agree that moving Political Science to the Bush School makes sense. Since the Bush School's focus is public service and that definitely lives in the political environment. I do think we need to study where is the best fit for journalism i the university. First, we need to define what journalism in the future will look like because it will definitely be different than newspapers. Maybe it should be communications rather than journalism. In this sense, it would include how to distinguish between news (facts only) and view points. Maybe a good fit would be in the Marketing Department of Mays school. Students would learn the best ways to communicate what they are telling the public. In summary, I feel Texas A&M needs to focus on its strengths and not try to be like other universities.

The College of Geosciences should remain independent. It hosts a unique culture and combining it with totally unrelated academic programs would serve to diminish it.

I agree with the recommendations to combine colleges to create the College of Arts & Sciences as described in Recommendation #1 and #2. However, I do NOT want A&M to add any Music degree programs that simply duplicate great music degrees offered at other universities in Texas. As a taxpayer and an A&M Former Student as well as an advocate for and lover of music, dance and visualization, I do NOT endorse creating duplicate programs across the state simply "because they're nice to offer." We do NOT need to provide duplicate music degree programs at A&M simply to attract more Liberal Arts/Fine Arts students. Texas already has excellent music and arts programs at other state universities. This report cites those programs as ones to be imitated by A&M. NONSENSE! The state should NOT and CANNOT afford to offer all things to all students at every single university in the state. This dilutes the quality of faculty and staff at each university, this duplicates programs that in turn require yet more and more ADDITIONAL facilities and administrative staff and their COSTS to the taxpayers. WHY do this?? If a student is that dedicated to a music or fine arts degree, let him/her pursue it at UT, UNT, Sam Houston State, SFA, UH...there are many fine, fully established music and arts programs/degrees at those colleges. A&M can continue to provide "outlets" and basic "performance" courses for Aggies wanting to play in a jazz band, concert band, symphony, to sing with the Century Singers, Singing Cadets, etc. But we do NOT need to duplicate the extraordinary costs for more faculty and staff here when many other Texas state colleges have plenty of room for students to get their music/arts degrees elsewhere. A&M will NOT "suffer" if we don't add STEAM degrees along with STEM. Universities CANNOT and SHOULD NOT try to be ALL things to ALL people. That's wasteful and dilutes the excellence levels each university has developed over the years. EVERY college does not need to offer law degrees, or vet degrees, or music degrees, or engineering degrees, or architecture degrees, etc. But you get my point. Regardless of how "convenient" it might be to students to have ALL degrees offered at ALL of our universities, it is extremely wasteful and COSTLY to taxpayers as well as to students. My oldest sister desperately wanted to attend A&M. But she also wanted to major in music, given her superb talent on the piano and organ. She made the difficult choice to go to North Texas, not A&M. Life is not fair, never will be. We all have to make choices and won't always get the results we want and expect. Recommendation #3: I have a Journalism degree from Texas A&M in 1974. However, I oppose restarting the Department of Journalism and degree program UNLESS it is structured differently than ours in the 1970s. The majority of faculty teaching journalism then and for many years after openly preached how news media were the gods of the country, virtually above the law, only answerable to each other but definitely responsible for keeping government and the rest of the country "in line." During class discussions and lectures, faculty mouthed words about independent thought and reporting, but only if it matched the words and tone of the NY Times and Washington Post. All authorities--including all A&M administrative authorities--were to be mocked, distrusted and vilified. Editorial writing had to stem from very liberal viewpoints. Period. Sadly, social media/texting prevent students from knowing how to write complete sentences, punctuate, or spell. (Most ignore their auto-correct features!! Lol!) Basic writing and oral communication skills should be taught BEFORE reaching college. But I'm aware many brilliant students wrapped in STEM courses cannot communicate orally or in writing their brilliant knowledge and research. They DO need basic communication and composition training. I endorse those classes. Recommendation #4-9: I heartily endorse the report findings. A LOT of oxen will be gored. Jobs at all levels likely changed, enhanced, even lost in some cases. But these major steps pay off long term. Every one of the private sector companies for which I worked was pressured by market forces to take difficult steps to survive and thrive. I have been laid off for "economic reasons" and "downsizing." It hurt like hell. But companies and colleges cannot afford to exist simply to "provide jobs." Each branch and level of A&M, each job, must serve a distinct and truly needed purpose. Tax dollars ARE limited, contrary to what many think. We must take those tough steps to ensure the entire university survives, not just a few isolated ivory towers.

Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. \*\*I disagree with this alignment. Texas A&M has set itself apart by providing dedicated Administration for study in those fields within the separate Liberal Arts and Sciences colleges. This allows educational specialists, in the separate areas, drive the future of the curriculum for students. You can achieve a balanced curriculum by continuing to collaborate across separate colleges without combining them. The combining of colleges likely will drive away top candidates from pursuing Texas A&M.

---

Creating a College of Arts and Sciences gives a higher profile to those programs, and creates helpful paring with Agriculture, Engineering, and A&M Health.

---

This is the most concerning section of the report to me. I strongly disagree with about half of the recommendations put forth here, including Finding 1, parts of Finding 2, parts of Finding 5, parts of Finding 6, and most of Finding 9. Merging Liberal Arts & Science seems like it is being recommended just to make the combined college bigger, which doesn't in itself seem to create any benefit. It seems like while the college of science might benefit from some internal reorganization, the thrust of this item is to prop up liberal arts by combining it with science. Finding 2 is another example of taking a strong program & dragging it down by tying it to unrelated, weaker/new programs. I am strongly opposed to the Department of Visualization leaving the College of Architecture. It was born there, and is strongly linked to the way architecture is designed and presented, and should stay there. Finding 3 makes sense, and I would further suggest that Journalism, along with possibly other related liberal arts majors like communications, combine with Finding 4 and move them to the Bush school as well to expand its base. Finding 5 regarding reorganizing Biology/Science makes sense, but I disagree with moving any of it to a college of liberal arts & sciences, as mentioned above. Finding 6, again I disagree with the creation of a college of liberal arts & sciences. Beyond that I don't have too much opinion on moving/merging University Libraries. Finding 7 makes sense, assuming there were not major objections from TAMU Health personnel on the changes suggested by their own internal assessment. Finding 8 seems logical, again assuming those directly affected by the reorganization agree it makes sense. Finding 9a - University Studies is a bad major to offer. It formalizes being directionless and makes it acceptable to the university, which to me signals a lack of caring about the student. It says "please come and spend money for 4+ years here while we do nothing to help you become prepared & qualified for a career" to me, which is not being a good steward to the citizens of Texas as such students would likely graduate with large debt and few career prospects. Finding 9b - I would defer to those in the College of Veterinary Medicine. I know it is one of the premier colleges at the university, and I would not want to detract or negatively impact it. I also question the rationale that states the USDA reported needs for large animal vets, but really only focuses on small animal items. Maybe the assessment found the large animal facilities and curriculum were already in good standing & just didn't state it in this assessment? Finding 9c - Construction Science is not engineering, and needs to stay integral with the School of Architecture. A&M has always had a reputation for more technically prepared students in the field of architecture, and I think a big part of that is the integration with construction science. This allows students to get hands-on experience building aspects of their designs and really understand the tectonics of buildings. There is also no mention of where the School of Architecture fits into the four-legged stool approach to the university reorganization. I think a greater problem in why the school has stagnated in rankings is due to the prolonged lack of leadership & politics involved in selecting deans & department heads. Hopefully the suggestions under Faculty Affairs would help to address this aspect that the school has struggled with since I was there. Finding 9d - I think this part of finding 9 is the least objectionable.

---

Do NOT get a journalism department. These are going the way of the edsel and dinosaur. Do NOT merge Arts and Sciences. We are NOT in Michigan, nor do we want to do things like a yankee university.

---

Agree we need a New College of Arts and Sciences, but disagree on moving the Department of Visualization. Architecture is over 100 years old in A&M and art and design is an integral part of our profession. I also disagree on moving Construction Science to Engineering, it is such an integral part of our profession and is growing closer.

---

Howdy! I am writing relating to Finding #4 under Academic Realignment. I am a proud graduate of both the Political Science department (2009) and the Bush School (2011). I was happy to read of the strong support for these departments. I think fulfilling the recommendation to merge these departments, however, would have a detrimental effect on the culture of the Bush School. The Bush School's selective criteria and shared experience of the master's degree programs have an enormous positive impact on the School's culture. Bringing undergraduates into the department will dilute the prestige of being a "Bush School graduate." I have worked in the public sector since graduating and know the strong reputation of the Bush School across the country. I urge rejection of this recommendation to keep the Bush School as a graduate-only department. Thank you for the work put into this matter

and for your consideration of my thoughts.

---

I strongly disagree with the proposition of combining the colleges of science, geoscience and liberal arts. On the whole, the mission of these divisions do not mesh. Science is the study the world around us; such an endeavor is vitally important to both furthering mankind and preserving the life of our planet. While it is also important to understand human nature, the overall goal of the Liberal Arts is not focused on the world around us, but more introspective. To combine the college of science and geosciences could align similar goals, but the inclusion of the liberal arts college would create an divergent path for leadership. This divergent pathway between objective pull of the hard sciences and the subjective pull of liberal arts could change the course of a unified college limiting the potential of both. I feel it could be beneficial to combine sciences and geosciences but allow the liberal arts to remain independent

---

I strongly disagree with Recommendation #1. I do not believe that the visions of the Colleges of Sciences, Liberal Arts, and Geosciences are aligned, and that strongly believe that combining the three Colleges would be detrimental to the goals of each. TAMU is a STEM focused University, and I do not believe that creating a new "College of Arts and Science" will do anything to create a stronger advocacy for the arts. The College of Engineering is a cohesive unit in which all the students enrolled are trying to become Engineers. The College of Business is a cohesive unit in which all the students enrolled are trying to enter the Business field. A "College of Arts and Sciences" is a divisive unit in which half of the students are trying to becoming scientists, and the other half are trying to study the arts. I strongly oppose every subsequent Recommendation that proposes additions to the new "College of Arts and Sciences." As if combining the 3 existing colleges doesn't create a muddled enough mess, further adding on all the extra proposed groups (Journalism, Libraries, University Studies, etc.) just creates a large, unfocused, mess of a College that is being pulled in too many directions to have proper leadership, or sufficiently fulfill the needs of its now incredibly diverse students. I cannot emphasize enough how terrible I think this idea is. I am happy to discuss further at any point in time. If the consideration for combining the colleges is based on financial savings, then consider combining the Colleges of Science and Geosciences into one larger College of Sciences, and combing the College of Liberal Arts with the proposed School of Visual and Performing Arts from Recommendation #2. This second, larger College of Liberal, Visual, and Performing Arts can also house the Journalism School and Libraries from subsequent recommendations.

---

As a former geoscience student, I am advocating against merging arts & sciences. The college of geosciences enjoys a tight knit community, which allows for fewer distractions & more care per student. O&M and Halbouty are unique to us and we are proud of our little college! It makes A&M unique and it gives geoscience students something that feels specifically ours. The merger would drown geosciences within the larger colleges of science & liberal arts, and may give less exposure to geosciences than already exists. I am against the merger for these reasons and more. The college of geosciences is special and unique, and I believe it should remain its own college.

---

Regarding the proposal to re-establish a Department of Journalism: As a graduate of the original Department of Journalism program, I was disheartened to see the program disbanded some years ago. I will be equally disheartened if a program is re-established without a commitment to teach true, unbiased, fact-based journalism. If the approach here turns out to be creation of agenda-based "journalism" education, please don't even bother. Let t.u., Missouri and the others pump out those graduates. Your rationale states, "To aid in the restoration of trust in media and increase engagement rates, it is key that students and the public gain a comprehensive understanding of journalistic terms, processes, and transparency practices to become more responsible consumers and producers of journalism." At the core of this quest is the creation of a program - led by conservative practitioners (assuming you can find them) - that will encourage students to be dogged in the pursuit of facts, undeterred by political pressures and biases, and objective and unafraid in their reporting of findings. I would support a program that proves itself to be of that making.

---

Several academic realignment recommendations are very bad. Texas A&M should strive to do what is best for Texas A&M, not based on what other universities are doing that might be much smaller in scale, or different in focus. The recommendation to remove Visualization from Architecture is a bad idea. Visualization and Architecture are more similar than the other programs indicated, and it is important these students share the same spaces. Refocusing the College of Architecture as proposed is a terrible idea. These four programs (Visualization, Architecture, Urban Planning, and Construction Science) mesh well together and the variety of perspectives students can get from classes and faculty will be lost with the proposed moves. Construction science students are totally different from engineering students as well. As a graduate of both College of Engineering and College of Architecture, I am deeply concerned about the proposals to gut the College of Architecture contained in this report. Other recommendations: Combining the arts, sciences, and geosciences mashes programs together that have different ways of learning and ways of knowing, and the

students are very different as well. Combining Political Science and the Bush School is a disservice to both units, and may be counter to the purposes they were created for (at least certainly for Bush School).

When discussing the four-legged stool structure of AgriLife, Engineering, Arts and Sciences, and A&M Health, there is no mention of the Mays Business School or the College of Education and Human Development as separate colleges. Would they remain separate or be absorbed into this four-legged stool structure? I would think given the academic standing and reputation of the Mays Business School, you would keep it as a separate college/academic unit as it would not seem to fit under those other four. Clarification is needed on this, as well as pertaining to the College of Education and Human Development.

I am very much opposed to combining the colleges of geosciences, science and liberal arts. Graduates from the college of geosciences are very proud and I would expect that merger to cost the university in donations.

If the College of Science is moved into the Liberal Arts, it would dilute the sciences and tend to lessen the emphasis on STEM education at a time when there needs to be more focus. If that move occurs, I will STOP my support through the endowed scholarships I have given and other support of the university as a Legacy Society member.

Leave structure as is. Construction Science and Visualization are both high ranking and well known. Moving them to another college could change that.

academic programs should reflect real world expectations of career fields. students should be encouraged to pursue different majors and change programs as they see fit to see where they fit best in the world

This MGT survey was an abomination. Pushing the narrative further to change the campus and overhaul it to be another run of the mill university. What gives Texas A&M its strength, power, and future, are the very things that make us unique. Curious how none of the universities we were peer/compared to are even in Texas. These comparison universities are beneath us, or different entirely, in the same manner as milking a cow vs milking a bull, and the complaining that your milk tastes differently. Cherry picked data to justify hitting Texas A&M with a banhammer and to alter the university, remove its identity, entirely. People say that what we identify as matters, well Texas A&M identifies as Texas A&M, and if you refute that, you're a bigot and are dismissing the lived truth of A&M. Yes the College of Engineering is huge, as it should be. Advising is decentralized, governed by each major, as they should be. You'll never have a one size fits all approach, and trying to shove the university and its respective colleges into a "big box store" feel, as this report would suggest, destroys the very fabric of what makes us Aggies. Trying to shove in 25,000 engineers by 2025 risks diluting down the degrees or simply put, dumbing down the curriculum to pursue more students.

Additionally, merging the College of Fine Arts and Sciences, as many smaller east coast schools do, does not make sense nor enable either entity the ability to perform as unique and necessary institutions on their own. If you wish to improve the university, might I recommend cost saving initiatives like never paying for another such a slanted and asinine survey again. Perhaps considering cutting the University Administration's salaries by 10% as well. Speaking of cost savings, DO NOT outsource student on and off campus transportation. The current model makes sense, and such outsourced services at other universities always ends up being more expensive in a matter of a couple of years than any immediate cost savings might hint. You will pay more, get less, and be confused as to why... Why was this even an option? Look at what happened with outsourcing dining services. Pursuing diversity over meritocracy, over talent or the outcome, is a fool's errand. Diversity should be cultivated organically and naturally, not forced and mandated. Diversity is great, but chasing metrics and numbers over anything else and rejecting the notion of assimilation while encouraging the students to celebrate what separates us is not healthy. Change for the sake of change simply to change and virtue signal will not yet results, will not bring us together, and will not continue the ability of A&M to be a natural melting pot. Let talent speak for itself, and let those who wish to join A&M do so freely. The desire to erase campus landmarks to resemble west coast university appeal also does not sit well with me. Remarks about the Corps of Cadets being "too Caucasian" is not only insulting to our diverse group of Cadets but a surface attack on the Corps' rich history and selfless service.

Creating more commissioned officers to the US Military than all the service academies combined should tell you that the Corps has the ability to form the talent, respect, and love for each other that is required in a military environment. The Corps of Cadets, and the College of Engineering, are fine examples of successful melting pots creating cohesion and powerful leaders. As they say, Highway 6 runs both ways. If faculty, administration, or students, do not like Texas A&M, they are free to leave whenever, and can go attend or work for a university more aligned with their emotional support needs. Those who wish to be Aggies will be Aggies. The University has thrived for a century and a half being run the way it is... Forcing us to change to be similar to UCLA or Maryland will destroy our identity. I say this as a First Generation Aggie, who came not from wealth, but a family of poor immigrants, refugees, and poverty. As the first in my family to go to college, A&M represented everything I aspired to pursue and be. I took on tremendous debt to break the

cycle of poverty in my family. Texas A&M was the beacon to freedom, and it still is. The desire of the MGT survey however risks undermining that legacy for the Boogeyman fighting game of "equity" and "diversity and inclusion" while throwing out the University as we know it. I strongly believe the MGT Report offers the chance/opportunity/paper thin justification to radicalize and change the University to better suit the political leaning aspirations of those who dislike Texas A&M.

---

My comments below are in direct reference to the recommended change to move the Department of Construction Science to the College of Engineering. I was part of the Department of Construction Science during my time at Texas A&M and graduated in 1999. First, moving the Department of Construction Science to the College of Engineering could place challenges on the talent recruitment for our industry at a time when the construction workforce is already strained. The Construction Science Program currently caters heavily to the building construction industry. If the department were moved to the College of Engineering, the building construction industry would be "competing" with a much larger variety of industries as opposed to just the actual building construction industry. Secondly, at other universities where their construction management program is under the engineering college umbrella, the curriculum is vastly different than that of what our program possesses today. Much of the curriculum in engineering colleges lacks key elements that have been developed in Texas A&M's current Construction Science curriculum specifically for the commercial and residential building construction industry. Lastly, in the commercial building construction industry, architects are the primary hub for the design team. Moving our students out of the College of Architecture would distance them from students in architecture creating an inconsistent environment than what exists in our industry. This collaboration is already challenging to implement in the higher education model and would be worsened if this move were implemented. As a former student from the Department of Construction Science, I implore those that ultimately will make the final decision to not accept and implement the recommended change to move the Department of Construction Science to the College of Engineering. To me, there are just too many negatives that come with making this recommended change.

---

Very much agree to moving construction science to engineering and visualization to a new Arts department. Also Journalism and Communications having their own respected department This is how University of Texas is set up and this teaches, serves, and challenges the students and is overall more impactful and impressive for the university on a whole. This would be more desirable to prospective students and meet the academia needs of students of today and be more progressive!

---

In regards to the recommendation to move the Department of Construction Science out of the College of Architecture and into the College of Engineering, I have serious concerns over the recommendation. As a former Construction Science student and industry professional, moving the department out of Architecture would have serious negative impacts on Construction Science. I previously worked for a large general contractor in Houston that recruited heavily from the A&M Construction Science program, I am currently [REDACTED]. In addition to my personal feelings, many of my industry member companies share my concerns with a potential move. A move into engineering would negatively affect the industries ability to recruit talent, which is already in short supply. The current curriculum is incredible, and heavily influenced by the people within the industry to prepare students for their futures in the construction industry. It is a practical curriculum based in real world application, and the construction science students graduate ready to contribute immediately to their companies. Please please consider discussing this move further with industry professionals prior to making it a reality. I would be happy to facilitate a discussion between my members and President Banks, as many of them are Aggies and care very much about the success of the University in addition to the students who contribute to the industry's success. [REDACTED]

---

I concur with the report findings.

---

[REDACTED] I am a Construction Science graduate from the Class of 1997. I write this in the brink of my re-entering the workforce after a 15-year hiatus to raise my children and take care of my elderly parents. [REDACTED] I have always worked in engineering when I was using my degree. I worked for [REDACTED]. In those years, I had to often correct people who thought I was an engineer and explain that "my degree is in Construction Science which is in the school of Architecture". It got old not being able to claim that I was an engineer, even though I worked in the industry. At times, it made me seem less than my co-workers even though my role as a team member was just as important as their roles. So, with that being said, I personally would love to be called an engineer, but I don't know how that plays with never

being able to develop from EIT to PE and so forth. It's a missing link. So think about this if you change the curriculum as to how this will be labeled. Would we be Construction Engineers instead of Construction Science graduates? There are many career paths that come out of the program. I know there are many graduates that go to work for construction firms as opposed to the path I chose. Should this be a path within the program, kind of like a minor of some sort? I really would have liked to have obtained a business minor when I was there, but it wasn't an option at the time. Later on, I hired a graduate of the program who was able to obtain that minor. I know things change, and I know that President Banks has been very successful in helping engineering students complete their degrees, more so than people in her previous roles had done. I often wonder if she had been at the helm of the engineering department when I went through A&M if I would have been able to complete my original plan on becoming a Civil Engineer. I was discouraged by my departmental counselor at the time and changed my degree to Construction Science in the middle of my Sophomore year. He told me that, "Some women were made to bake cookies, and some were meant to be engineers." I encountered a couple women throughout my career who also had this same advisor and received the same message. It is refreshing that this mentality is no longer tolerated at the university! My concern would also be for the students who have already begun their Freshman year at the University or within the University system (ie: TAMU Corpus Christi) who were working toward a certain GPA to get into the program if that requirement would be raised in the midst of their efforts which might seem unfair if the bar was changed in the midst of this. Engineering is challenging to a level beyond Construction Science. I hope this degree is still obtainable and a safety net per se for the kids that might not be able to be at Engineering caliber, but still are decent students and have potential to contribute to society at TAMU Construction Science graduates in the future. I might not be able to rightly call myself an Aggie Engineer today. I leave that title to those who cut the mustard, but I have no shame calling my self an Aggie Constructor, and proudly wear my Aggie gold. I know I still have a lot to achieve with my degree, but I hope that if you do change the program, that it doesn't become so elite that a student similar to myself wouldn't be given the opportunity to experience this program. I think that Engineering is the way to go with this degree from my experience, but it definitely shouldn't have an exclusive GPA to get into the program. While the structures classes are rigorous, it definitely doesn't have the math and science components that the other engineering degrees require, and it doesn't need to. I got what I needed to be able to do what I needed to do from the program. Scheduling and cost control courses have been key to my career in project controls. Best Regards,

---

The "realignment" of academic fields should not forsake the true strength and legacy of traditional A&M studies, those of Agriculture and Engineering. We are not, and should not pretend to be, a Liberal Arts institution.

---

Many of the recommendations are valid and would have positive affects for the students of the university. The restructuring of the college of science to essentially strip it of a purely science department of biology does not seem wise. If there is, as the report indicates, a duplication of and a confusion of assisting students, it betters serves for those biology components outside of the biology department be brought under the biology department umbrella. This provides students the ability to receive guidance from faculty that knows and understands all branches of the biology science. Also, the research provided by the biology department is vital to the building of the university's reputation as a world class research university.

---

To what? Please give some reference.

---

BIMS must be reorganized ASAP- There are not enough seats offered for core classes- every semester- why?. Students must be forced into classes by advisors who do not respond for months. Classes must be taken in an approved sequence and there are never seats available. Students should not have to contact advisors every semester to get their classes. Advisors give incorrect information they do not stand behind causing students not to graduate on time. Why does A&M accept payment for a degree that students cannot register for core classes? BIMS does not offer human anatomy- any student who wishes to continue in the human medical field must re-take this class to be accepted into medical programs. Do not advertise as a pre-med/pre-dental program when it is only veterinary-based. It is clear the current BIMS staff are not able to offer a functioning program to students. Degree plans are changed without informing JR and SR students of new requirements. Consider joining parents groups to read issues first hand. Students leave this program saying BIMS staff do not care, are unhelpful, and offer nothing to help students succeed- it is a battle to graduate in this program. PLEASE make this a priority to improve it is disgraceful- Texas A&M can and must do better. Thank you

---

The College of GeoScience should stay where it is at. I do not like the idea of mixing it with Science and Arts. We have a great department please don't mess with it. My daughter is a senior geology major. Also keep construction science out

of engineering. My husband has that degree and it is a well respected program and his company only hires hires in that field. Moving it to engineering is a terrible idea especially with the present ETAM. Construction Science don't even take Chemistry etc.

---

I fully support the recommendation to invest in cultural centers, including a performing arts center, a museum and hospitality center, and campus gardens. However, I do not support shifting the focus of the university by combining the College of Liberal Arts with the College of Science and the College of Geosciences. I prefer Texas A&M remain a STEM-focused university, true to its own values and foundation, without regard to what peer institutions do.

---

I am VEHEMENTLY opposed to Rec #1. This consolidation would push away employment opportunities, student development and water down the degrees that make Texas A&M unique. Why on earth would you risk the #2 national ranking for meteorology? Why would you jeopardize the attractiveness of students in your undergraduate and graduate Geology programs by pushing their majors into a "diluted" or "smorgasbord" college? Rec #2 - A quick conversation with Pixar and the vast number of NATIONALLY known companies would steer you away from moving the Department of Visualization. The technical nature of the TAMU Viz program is why it is one of the most IN DEMAND degrees. If you are insistent on building/growing Visual and Performing Arts degrees, then expand the College of Liberal Arts to include more degrees in music and art. Rec #3 - I wholeheartedly support establishing a Department of Journalism (re-establishing it for those former students who recall when there was one), but it should be within the College of Liberal Arts and NOT in a combined Arts and Sciences college. There could be/should be more synergies with the Communications and English departments and leverage partnerships with Sports Management and Marketing. It's disappointing that the University of Houston has a stronger reputation in journalism simply because they have a focused department, yet TAMU has equal or more infrastructure to support this department. p.28 "Create expanded opportunities, like internship programs, for students to interact with local as well as national professional journalists, media outlets and related companies. I agree with this concept, but there needs to be a significant increase in oversight of the internship process, especially the unpaid internships that are often promoted/encouraged/required for graduation. Local companies (like the Brazos Valley Bombers) take advantage of these requirements and create unsafe and unrealistic roles under the guise of "internships." For example, 60 hours of unpaid duties including cleaning, laundry, food sales and equipment transport should not be allowable to meet the requirements for Journalism, Communications, Sports Management, etc. Rec #4 - moving/merging the Department of Political Science to the Bush School is one of the most logical recommendations in this entire report. It would enable synergies of professors and extracurricular/development activities. Rec #5 - Merging the Department of Biology and the Biomedical Sciences Program into Biological Life Sciences makes a lot of sense for shared resources (professors, advisors, labs). Unless SIGNIFICANT attention is placed on the underperformance of professors/teaching staff, you will continue to see large dropout rates and very few minority students reach graduation levels. If TAMU is truly committed to Diversity, the University must intervene and provide support for the first and second year classes which have gone from "weed out" to "drop out." Rec #6 - I disagree with this proposal. The new department of library sciences is needed, but it should be within the College of Liberal Arts. I am completely against a College of Arts and Sciences as it will dilute ALL of the degrees within the college. Rec #9 - I agree with the consolidation of University Studies degrees as the current "smattering" leads to haphazard advising, poor focus on degree plans and unrealistic expectations of students and parents. These degrees should be folded into the College of Liberal Arts as is seen at many similar institutions. Rec #9b - I agree that the College of Vet Medicine should be on graduate education only and I support the construction of a new small animal hospital. Rec #9c - It is clear that the authors of this document are not well versed in the University rankings by employers. The Department of Construction Science has one of the highest placement rates because it sits WITHIN the College of Architecture. A move to the College of Engineering would dilute the Construction Science program and remove a key recruitment factor (of the architecture foundation that exists today). Rec #9d - I support the consolidation of Health and Kinesiology with the School of Public Health. Many students who major in Health and Kinesiology are pursuing medical/health post graduate studies and the connection would provide synergies in instruction, advising and career development.

---

I think the recommendation to put the Department of Visualization into the new School of Visual and Performing Arts is a good move and will increase the funding and grow the department. Meanwhile hopefully retaining and acquiring more key instructors to prepare students for work in the animation/digital creation fields. It might also do away with the strict study abroad/internships program as a requirement that has historically been difficult and expensive for Viz students. Lots of Viz students go into tremendous debt to meet this requirement and the alternative to do an internship has a lot of criteria that make it equally troubling to organize/attain. I think separating the department from the study abroad

broad requirements of the College would benefit students in the long run.

---

A&M has historically enjoyed strong Engineering and Agricultural Colleges and departments and these have been the strength of the University. The Liberal Arts College has, for all practical purposes, been a support college for Engineering and Agriculture. Do not change this dynamic.

---

Agree with most recommendations. Specifically believe that the College of Architecture should focus on its name, ARCHITECTURE, however this should include a baseline course in construction methodologies, knowledge of materials, processes and practicalities/realities of implementation of design. Too many young architects come out of school with no ability to design buildable projects. Architecture should not lose its role as the driving discipline in the planning and design of facilities for human use. The college should include an Interior Architecture/Design department. The profession needs professionals who understand and can lead interdisciplinary teams across all project stakeholders. Architecture should maintain its focus on teaching how to think, being able to array and assimilate diverse information that while always incomplete leads to appropriate solutions. A strong collaboration should still exist between Visualization and Construction Sciences even if no longer in the College.

---

Realignment of Academic affairs. The committee did not address EnMed. There needs to be a realignment of the EnMed program with respect to COM. It is very difficult when you have COM whose organization and members focus specifically on rural and military medicine, and do not have engineering degrees, to provide oversight and have decision making over EnMed. COM has responsibility for the admissions committee which oversees both COM and EnMed, and yet EnMed requires an engineering undergraduate degree and an engineering master's degree as well as an MD. The individuals in the EnMed program are much different in backgrounds and capabilities than the rural medicine doctors at COM. COM has control of the Admissions Committee for students applying to the EnMed program, they oversee the EnMed and the student admission process and selection, they choose the Dean of the EnMed program, and to add to this problem, COM itself is very dysfunctional. Of all the subjects that were evaluated, the one that has been missed with a big red exclamation point is EnMed and COM. You cannot have two more different organizations. One, COM, is in charge of the other and yet has so few skill sets and commonality of the EnMed program. This dysfunction must be addressed in more detail and resolved, as EnMed and its staff and students are in a very difficult operating structure as long as they are controlled by COM of the A&M medical campus.

---

While I generally agree with most of the recommendations cited in the Academic Realignment section of this report, I STRONGLY DISAGREE with combining the College of Liberal Arts, College of Science, and College of Geosciences. The rationale for combining these colleges (other large universities have done this) is, at best, a weak argument. One of TAMU's strengths is its unique academic environment. Additionally, making a College much larger seems to be counter to the overall goal of making Colleges and Departments more efficient. In order to centralize operations, I would recommend combining the Colleges of Science and Geosciences while keeping the College of Liberal Arts separate. Moreover, I don't disagree with most of the other recommendations but would still keep separate the College of Liberal Arts separate from the new College of Science. I agree with establishing a new School of Visual and Performing Arts, Department of Journalism, merging the Bush School and Political Science Departments, Department of Library Sciences. I would, however, place these new schools / departments in the College of Liberal Arts. Similarly, I would agree with creation of the new Institute of Biological Life Sciences (and inclusion in the College of Science) and a continued collaboration with the College of Veterinary Medicine. I also agree with relocating the Department of Construction Science (with Architecture, Landscape Architecture, and Urban Planning) to the College of Engineering. More specifically, I would recommend moving the Construction Science the Department to Civil Engineering. Much of the Civil Engineering program deals with design and construction of structures, so Construction Science would fit perfectly. Finally, I agree with moving the Technology Management Degree Program to the Department of Engineering Technology.

---

TAMU is known for a strong engineering and ag/vet school and every school has it's key strengths. We also seem to be growing well in our presence in health. My hope is that TAMU will not lose it's strengths by trying to diversify into the arts/journalism. I don't think it's bad to have a specialty that we are known for and primarily invest in. I disagree with putting Construction Science in Engineering, as this is not an engineering degree. This program has a different focus, certifications, and is not aligned with engineering. It is fit to stay in architecture where like companies come to do hiring and brand building on campus.

---

Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. Agree; combining separate colleges will provide streamlined governance and

collaboration across these colleges. Recommendation #2: Establish a School of Visual and Performing Arts with new departments in music, performing arts, and fine arts, and relocate the Department of Visualization to anchor this new school. Disagree; A&M should continue to focus on the core curriculum of engineering and sciences and leave the Department of Visualization in Architecture. Recommendation #3: Establish a Department of Journalism Disagree. If The Battalion is an example of what a school of Journalism would teach, then we do not need to grow this type of anti-A&M, slanted reporting. Recommendation #4: Elevate and expand the Bush School of Government and Public Service to be a highly visible and accessible part of the university portfolio through significant investment and a merger with the Department of Political Science. Sounds reasonable and an overdue alignment. Recommendation #5: Create the new Institute of Biological Life Sciences which will contain the Department of Biology and the Biomedical Sciences Program. Agree and also overdue. Recommendation #6: Merge the University Libraries into the newly created College of Arts and Sciences and create a new Department of Library Sciences. No opinion Recommendation #7: Implement recommendations from the Texas A&M Health Administrative Organization Structure and Budget Assessment No opinion Recommendation #8: Improve research organization at TAMU Health This section is confusing and the recommendations are wordy. I agree with early-stage health knowledge program, but find the other recommendations hard to follow. Recommendation #9a. Reassign the University Studies degree program exclusively to the College of Arts and Sciences. Agree. Recommendation #9b Refocus the College of Veterinary Medicine on the core mission of graduate education and invest in the construction of a new Small Animal Hospital. Agree. Recommendation #9c: Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning Agree including moving Construction Science to Engineering. Recommendation #9d: Consolidate the Department of Health and Kinesiology in the School of Public Health, including clinical research associated with the Department of Health and Kinesiology. Move the Technology Management Degree Program to the Department of Engineering Technology. Agree. To myself, arts are vastly different than sciences not to mention the personalities drawn to each. I submit the College of Science and the College of Geosciences is a possible win-win scenario; however, the College of Arts should stand on its own. The other eight recommendations seem appropriate particularly from a timing point of view and would expand the overall student experience.

I strongly oppose the consolidation of the Colleges of Liberal Arts, Sciences, and Geosciences. Promoting and expanding the LA studies (and incorporating an enhanced PA program) has merit, but these programs can and should dance on their own two feet. • For the purpose of creating a large college for a 4-legged stool? (This was at the forefront of the rationale.) Maybe this would be advantageous for the LA and PA studies, but it would come at the severe cost of diluting the visibility of the sciences. Surely, the consulting firms do not believe Dance and Geophysics offers a level of synergy that would benefit either. And if bigger is better, why then decrease the size of the College of Architecture? • Because the University of Michigan and the University of Florida have Arts and Sciences within the same college? Since when does TAMU want to be a part of a herd? There was nothing in the report that suggested that UM's and UF's structure was superior. • Quite possibly, the importance and the visibility of the Geosciences has never been greater, and today's climate issues will guarantee this will continue decades into the future. Efforts should be made to significantly enhance the presence of the College of Geosciences at A&M. Relegating it to a department within a large hodge-podge of unrelated entities will have the opposite (and negative) impact. This "Comprehensive Review" mentioned the word Geosciences exactly twice in the entirety of the document. • In summary, none of the findings presented in the review suggested that the combination of these three colleges is a prudent move. ...Only that it might benefit the College of Liberal Arts due to an increased size advantage. The appearance is that this proposal is a large bullet point that only serves to justify the report. Better alternatives A) Rebrand the College of Liberal Arts to College of Arts. Combine the LA studies, PA studies, and Visualization, etal. B) Or, if cost savings via combining colleges is a true motive, then establish a new College of Arts and Architecture. Pros 1) Centralizing the units of Marketing and Communications, Human Resources, IT, Facilities, and Finance could improve efficiencies; However, this often looks better on paper than in practice. There will be many implementation hurdles and only a small efficiency (if any) will be gained. The payout period will be long. 2) Moving Building Construction to CoE seems practical, though not necessary. 3) Consolidating the various studies of Biology sounds logical.

I don't understand where the Mays College of Business fits into this realignment.

I was an English major & dance minor that graduated in 2006. I always felt the dance department was not in the right spot, but I was grateful we had one. I think creating a space for Visual & Pergorming Arts is huge! Texas A&M has so much to offer in most areas but does not have as much in the performing arts specifically. I think combining for a School

of Arts & Sciences could be really awesome for the university. This would give the dance department a better place & allow it to grow not only it's Dance Science major, but perhaps one day an MFA!

Students majoring in Journalism is declining so the program should be abolished rather than develop a new department. There are plenty of universities with sound journalism programs. Concentrate on what TAMU does best and don't try to be everything to all. The university isn't responsible for ensuring each student gets a job following graduation but it does have a responsibility of providing an education that gives graduates the skill sets necessary to compete in an ever demanding job market.

I was a business major while in school here. But I have been on the Development Council for CEHD for nearly 30 years and have a long love for the college and a sincere interest in who and how it serves the students and Texas A&M in the community. Some of the problems pointed out in the report between the overlap of certain programs between CEHD and Public Health are valid. I think that the "wet lab" programs of HLKN would be better suited for SPH. However, if I have read the report correctly, I think it would be a major mistake to move over to SPH everything that is currently residing in HLKN. Careful analysis needs to be made about the substance of the programs and where they would best fit. #1. A major misfit for SPH would be the sport management program. Sport management has been developed in CEHD over the past two + decades to be a top 5 program in the country; it is not by any reasonable objective analysis science/health based to merit a move to SPH. It would be like trying to put a square peg in a round hole. #2. Closely related to sport management is the Center for Sport Management for Research and Education. It's research and instruction is more teaching/business related, not health/science. #3. Another program currently in CEHD that needs to remain in there are the newly endowed Coaching Academy (related to K-12 teacher and coaching education and certification) and PEAP (physical education activities program, which would be the PE program when I was here many years ago. The courses in PEAP serve all students at A&M for "recreation for credit" and also help teachers become accredited to teach it. #4. Another CEHD program ill suited for transfer is Technology Management. It is proposed that it be moved to the Department of Engineering Technology. But when you look at the courses offered in it, it is fundamentally -as the title suggests-- a management course that is wholly unrelated to the disciplines of engineering. It is a program designed to help educators and others learn about technology and how to use it in supporting the education and business. It is an alternative course program for students who need to know about technology but who do not intend to be engineers. Again, transfer of it to the College of Engineering Technology would be like a fish out of water and a number of frustrated students. Finally, I need to hear more about merging the Political Science Department with the Bush School. More economic investment needs to be made in Bush. It is becoming a great graduate program recognized across the country. But I do not understand how its reputation will be enhanced by bringing in a number of undergrads, primarily for economic reasons. There may be very valuable reasons for doing so, but it was not presented in the report, at least to my satisfaction. Plus, what are the existing agreements with the Bush family and their feelings about the same? I think this is an issue that we cannot have too much information about.

Recommendation #1 fails to adequately support and promote STEM majors and the growing demand for college grads in these fields. While it may help to improve the academic experience of arts majors, it reduces the caliber of degree that STEM majors will have to market themselves with. Employers and companies looking to improve technologies and economies are not concerned with whether or not someone graduated from a larger sized college at TAMU--they're looking for people trained in STEM. To purport that a program such as dance & theatre arts is any bit as rigorous or demanding as the chemistry program, and therefore deserves the same level of administrative support and advocacy is preposterous. TAMU has focused on, and become recognized worldwide, for their STEM programs and graduates for a reason. Recommendation #4 is quite honestly a slap in the face to everyone who worked to establish a GRADUATE program for people pursuing a career in public service, and former students of the Bush School who had to complete their undergrad degree and then apply to be accepted into a demanding and intensive program. Especially considering students in numerous programs across TAMU already have the opportunity to participate in the 3+2 program, and earn their Bush School degree. A merger with the PoliSci Dept. would definitely help to improve the optics of that college and the caliber of their undergraduate degrees, but I fail to see where there's any benefit (aside from the referenced "significant investment") to the programs provided, the caliber of degrees awarded to graduate students, or furthering the missions and intentions The Bush School was founded with. Having been a part of the BIMS program before moving to COALS, I support Recommendation #5 as it will give students more leeway when completing courses and streamline programs, especially the switching of programs, for students.

As a land grant university, TAMU was founded to focus on agriculture and engineering, i.e. STEM education. Other outstanding universities have this focus and are considered "Top Tier." I was a STEM major who switched to Liberal Arts

and appreciated not having to go to a different university to do so, but to dilute the impact of our STEM programs by making Arts & Science the largest college is inadvisable. Other universities in Texas specialize in liberal arts programming, we should concentrate on what we do best. Not sure where the Mays School falls into the realignment either - it is a successful college that should continue to be nurtured. Merging biological studies is a no-brainer.

This topic is a huge portion of the report and covers many areas, much of which I agree and will enhance the image of the University in general and support student success. However, I am concerned with eliminating the College of Science as a separate entity. The College has made great strides in recruiting first generation students while focusing on academic support and retention of all students within the College. I enjoy the interaction with the Dean, department heads and professors within the C of S. I am also concerned that funding would be allocated to the liberal arts departments to the detriment of the C of S. I have committed a number of scholarships to the College through current giving and estate planning and should funding or structure change drastically it would cause me to rethink my estate plan commitment. I do like the idea of the Institute of Biological Life Sciences as an effort to streamline the various biology departments throughout the University. It pains me to see the Department of Biology disappear however. From a facilities standpoint, the Biology Building is in severe need of renovation and upgrade. I hope this can be accomplished with the new structure. I do not believe A&M requires a Department of Journalism as the University does not need to be an institution of all things to all potential students of the state. There are many public universities with the State of Texas that allow students to pursue journalism if they so desire. It would have been helpful to have a high level organization chart in the report to better visualize the proposed structure of the College of Arts and Sciences.

I am not in agreement with the part of recommendation 9C which calls for moving the Department of Construction Science to the College of Engineering. The collaboration in the built environment between Architects and Contractors is enhanced by training COSC and ARCH students to understand each other's needs and challenges. By learning and working together while in school they learn the nuances of the Design/Build industry. That would not occur by moving COSC out of the College of Architecture. I am a '68 ARCO graduate which is now COSC and I have two sons who are '95 and '01 COSC graduates. Thanks, [REDACTED]

In response specifically to recommendation #9C: speaking from my experience as a student from Fall '17 - Spring '21. The Department of Construction Science (COSC) has been a part of the College of Architecture for as long as I remember. This connection between the College of Architecture and the Department of Construction Science is one of the elements that makes COSC stand out as a nationally ranked program. I agree that there are many similarities between engineering and construction, so shifting COSC to the College of Engineering could be a positive outcome. In my opinion, the following conditions shall be met in order for this shift to occur: - Home base for COSC to remain at Francis Hall. - COSC advisers to remain integral to the department of COSC. Shout out to Mr. Daniel Wu. - Faculty, staff, and COSC leadership to remain as is. The department of Construction Science currently employs a plethora of knowledgeable, experienced, former, and current construction professors that bring key insight, knowledge, and experience to the classroom. I respect these professors and the knowledge and life advice they give out freely. These professors introduce the students to the tools that current industry professionals utilize. - All COSC courses indicated within the COSC 139 degree plan (or the most current COSC degree plan, including all lower level and upper level Junior and Senior level courses) shall not be removed and shall remain as the cornerstone of the COSC program. - No specific engineering courses that would drive a student away from the COSC degree shall be added. During my time at A&M, there were many engineering students that made the shift from mechanical/civil engineering to COSC on the basis of rigorous coursework and realizing that engineering is not the route they wanted to do. The COSC coursework brings its own rigor that is specific to the construction industry. - The COSC career fair shall not be changed and shall be managed by the COSC department directly. - The COSC internship requirement shall not be infringed or changed and shall remain a requirement for graduation. For me personally, the internship was the gateway for my current employment. - Student organizations including NAHB, AGC, ABC, AWIC, MECA, and CCL shall not be infringed upon. I was involved in leadership for AGC and NAHB; these organizations were a key part of my experience at Texas A&M. - COSC specific scholarship program shall not be changed or infringed upon. - COSC Hart Hat ceremony shall not be changed or infringed upon. - The Construction Industry Advisory Council shall not be changed or infringed upon. - The COSC related minors, specifically the leadership minor, shall not be changed or infringed upon.

Recommendation #2- Remove Department of Visualization from College of Architecture. Visualization is currently a core function of architecture and will become even more so in the future. Building information modeling, virtual visualization and virtual construction techniques are an integral part of current design and construction delivery. As artificial intelligence, blockchain implementation and 3-D printing of buildings and building elements become more refined and

implemented in the design and construction processes, the importance of visualization to Architecture will be even more critical. TAMU will miss out on an important opportunity to be a leader in the research and development of the next generation of visualization as the focus of processes in architecture and construction. Visualization is not just gaming and animation. It is the way design is and will be communicated for development of the built environment. Recommendation #9C - Remove Department of Construction Science from the College of Architecture to Engineering. Construction managers, like Architects, are directors of teams comprised of specialists. The leadership, team building skills, and expertise in integrating divergent components is critical. Construction Managers need to know the same level of engineering knowledge as Architects. That is, a basic understanding of calculating a structural beam depth, of the loads on an electrical panel, or the tonnage of hvac needed. More importantly, Construction Managers need to know how a building exterior envelope and interior finish should come together and how all the systems of a building are integrated and in what order (architecture). Even if a Construction Manager intends to pursue horizontal construction, the knowledge and skills of land planning, development, stewardship and protection (landscape architecture and planning) are as important as the basic knowledge of grading, drainage and utility sizing which are also a part of landscape architecture curricula. Critical to Construction Science instruction are project initiation, scheduling and costing or all components. Engineering tends to be silos with many disciplines not involved in construction at all. Removing Construction Science from the College of Architecture also belies how many projects are currently implemented such as design- build (often contractor led but more frequently of late, architect led) and integrated project delivery led by the owner, architect and contractor. Almost never is the engineer the lead.

---

Regarding Findings #1 & #2: I oppose doing things because other universities do them in that manner. A&M has traveled a long path since 1876 also there is probably a reason why we are structured as such. In the case of the visual Arts program, That is the purview of a private college, not a land grant college. A&M is not called to be all things to all people. There are several programs that bring culture and the performing arts to the students of A&M. They do well. Regarding Finding #3: I can speak personally of this. A&M does not need a journalism department. Journalism has died and transformed to a social media venue. To my observation, the colleges with journalism departments are still pushing the newspapers that while I would like to subscribe to one, it is an outdated feeling on my part. My daughter did not go to A&M as they did not have a journalism dept. She was seeking to be an author. She chose the English curriculum at Ol' Miss and it did her well. Strengthen the writing and critical thinking courses in the English department and go on about the business of communication in that way. No Journalism department. Regarding Finding #4: If we do this, lets do it for the students and not as an aggrandizement for the Bush family. Somehow this smacks to me of the Bush school looking to dip into more state funds to spend. I give this a maybe. Regarding Findings #5, 6, & 7: Seem to be solid recommendations. Lets do this. Regarding Findings #8: Good idea....this could be costly Regarding Findings #9: Seems to be good recommendations. 9B : Do not abandon A&M's large animal veterinary medicine. It is still needed.

---

I believe the University Libraries should not be merged with the College of Arts and Sciences, but rather remain a separate entity. The libraries currently serve students and faculty in all colleges, staff, our surrounding community, and researchers from all over the country.

---

With regard to Finding#6/Recommendation#6 under Academic Realignment, I think it is a mistake to move the University Libraries into the College of Arts and Sciences. The libraries service all of the Colleges at Texas A&M and, in my opinion, should not be relegated to department status in one college. It is a good idea to create a Department of Library Sciences with degree options in that discipline, but should be noted that not all of the faculty involved with the libraries at Texas A&M hold Library Science degrees.

---

See general comments below.

---

I urge Texas A&M to NOT combine the Schools of Arts and Sciences. Firstly, we began as a college of Agricultural and Mechanical Sciences. It is one of our most sacred traditions that we are TAMU, and The Aggies. It was not until years after founding that Texas A&M introduced a fine arts curricula. Secondly, one receives either a Bachelors of Science or a Bachelors of Arts. STEM education is vastly important. Trying to make it STEAM is unacceptable. The Arts must have their own place. Would it not be more appropriate for there to be separate schools: The College of Science, Technology Engineering & Math, and The College of Visual & Performing Arts? Please do NOT undermine our storied and treasured history by turning us into every other indiscernible state university school who seeks only to have vast numbers of enrollments, but does not stand by their history. The Arts are incredibly important, but they deserve to have their own place. To combine the Sciences and Arts is doing both a disservice. Please keep our history of being a school of engineering and science separate from our desire to grow as an institution of fine arts.

a. Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. i. Finding 1: The entire purpose of this recommendation seems to be to “heighten (the) stature” of the new college and the university. I see no value. b. Recommendation #2: Establish a School of Visual and Performing Arts with new departments in music, performing arts, and fine 25 ACADEMIC REALIGNMENT arts, and relocate the Department of Visualization to anchor this new school. i. Finding 2: It depends on what we want to be when we grow up. Is this a part of why land grant colleges were established? I see no value. c. Recommendation #3: Establish a Department of Journalism i. Finding 3: I’m ambivalent. We don’t necessarily need a Journalism department, and this finding seems to be based on “others have one; so should you”. I’m not sure the dollar investment would be worth it, especially given that today’s “journalists” seem to be little more than politically correct mouthpieces for the left wing of American politics. I doubt if a school of journalism at A&M could remedy that. d. Recommendation #4: Elevate and expand the Bush School of Government and Public Service to be a highly visible and accessible part of the university portfolio through significant investment and a merger with the Department of Political Science. i. Finding 4: Again, ambivalent. If such a merger benefits students by facilitating better instruction and/or administration, then so be it. However, if it’s for “prestige”, it’s a waste of time and money. The quest to “make A&M a ‘world class university’” is what had a large role in getting us into the mess we’re in today with student overcrowding, some anti-American faculty members, and students with no appreciation of the school itself. e. Recommendation #5: Create the new Institute of Biological Life Sciences which will contain the Department of Biology and the Biomedical Sciences Program. i. Finding 5: Agree. f. Recommendation #6: Merge the University Libraries into the newly created College of Arts and Sciences and create a new Department of Library Sciences. i. Finding 6: Agree. g. Recommendation #7: Implement recommendations from the Texas A&M Health Administrative Organization Structure and Budget Assessment i. Finding 7: Agree. h. Recommendation #8: Improve research organization at TAMU Health i. Finding 8: Agree. i. Recommendation #9a: Reassign the University Studies degree program exclusively to the College of Arts and Sciences. i. Finding 9a: Agree. j. Recommendation #9b Refocus the College of Veterinary Medicine on the core mission of graduate education and invest in the construction of a new Small Animal Hospital. i. Finding 9b: Agree. k. Recommendation #9c: Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning i. Finding 9c: Agree. l. Recommendation #9d: Consolidate the Department of Health and Kinesiology in the School of Public Health, including clinical research associated with the Department of Health and Kinesiology. Move the Technology Management Degree Program to the Department of Engineering Technology. i. Finding 9d: Agree.

The Academic Realignment should create a College of Computing. The College should include the following departments or degrees: Computer Science, Computer Engineering, Masters of Data Science/Analytics, MIS, Architecture Visualization, Center for Cybersecurity. The new IT CIO department should have a dotted line to the new College of Computing Dean. Rationale - A few leading educational institutions have already created a College of Computing including MIT, U of Washington and Georgia Tech. Computing has become pervasive in both our personal and business lives. It is fundamentally changing how we live and work. It is one of the fastest growing fields in both academics and industry. As TAMU considers changes to other Colleges and departments, it seems an omission that a College of Computing is not created and focused on. There is an opportunity for TAMU to be seen as a leader in this area. The alignment of the new College of Computing and the CIO of IT will allow new collaborations between the academic work of the College and the real life application of IT at a major institution. Software projects in IT could be capstone projects in the College of Computing overseen by professional project managers. Internships in IT could be filled by student workers.

In my opinion, Texas A&M should continue to strengthen it's core competencies and focus on programs that give students skills that are marketable. Agriculture, Engineering and Business are all recognized programs and are where we make and continue to impact students and industries. I don't see the need to add new departments and majors simply because other Universities have them.

With respect to Rationale #1, I get the idea of the four legged stool alignment. But at the same time, bigger is not always better. A&M has never needed to be like other institutions. As the report notes, there are plenty of places where faculty and students can go to have a big College of Arts and Sciences. What the report does not explain is why having smaller, more intimate, separate colleges is a problem. All it says is that it will create stronger advocacy for the college at a STEM institution, but my impression has always been that liberal arts and sciences at A&M are strong. The "four legged stool" concept also does not account for the Mays College of Business, which SHOULD NOT be part of a College of Arts and Sciences. That means it is at least a 5 legged stool. The report basically says that "bigger is better," but does not explain why. It also indicates that faculty prefer bigger colleges of arts and sciences, but provides no data to support this claim.

It would be equally likely that faculty and students at a larger STEM-focused university appreciate having their own niche within the larger organization. In a STEM-focused university, it seems equally possible that liberal arts gets dominated by the STEM aspect of a combined college of arts and sciences and the best way of giving it visibility and emphasis is for the liberal arts to stand alone as an area of emphasis. Again, just because other large universities do it does not make it the best approach for Texas A&M. Without better data, the only factor that appears to be driving this recommendation is cost savings, which should not drive this decision. With respect to Rationale #2, I would approach this recommendation very carefully regarding moving the Viz Lab. It is a Crown Jewel of Texas A&M and it needs to be located and supported as such. It is not clear to me that being part of what is effectively a fine arts program accomplishes this goal. The type of work that students of the Vis Lab will go on to perform attracts both arts oriented students and computer science/digital oriented students and merges the two. If the Vis Lab is part of a fine arts program rather than computer/design/digital sciences, it may not be as appealing to those students who are coming into this major from a more technical perspective. Please carefully consult with graduates of the Viz Lab program and current students and faculty before implementing this recommendation. Again, just because other schools do something, does not make it right for Texas A&M. I 100% agree with the recommendation to establish a Department of Journalism. Texas A&M not having a robust cadre of former students embedded throughout the media has led to significant bias against A&M in the media. We need our own Aggie journalists out there to balance the representation in the media. Just one example of how the media poorly portrays A&M happened this very week. Former A&M and current tu special teams coach Jeff Banks' girlfriend's emotional support monkey attacked a child on Halloween. When covering the story, at least one media outlet showed pictures of Banks only in A&M apparel. If there were an Aggie editor or other Aggie reporters on the team, this might have been avoided. Sports reporting alone is not the only reason to reestablish the Dept. of Journalism - as the report notes, there is a desperate need for honest, credible, fact-based reporting, but it does demonstrate one example of how the University suffers from having virtually abandoned a role in developing future journalists. And again - not to the exclusion of other journalism but - A&M should be able to provide a very attractive program for sports media in light of the on campus facilities of 12th Man Productions, TexAgs, and the access that student reporters are already getting from the athletic department. This should be one area - among others - of emphasis in a new department. Frankly, there are far too many academic realignment issues and recommendations in this report. There is very little explanation of how these issues (e.g., biology-related programming occurring in three different places) causes a problem. Much of this section reads like solutions in search of a problem. It might make more sense to defer many of these recommendations to a phase II review after some of the more fundamental changes are made. There is just not enough justification and analysis in this report to understand why changes are needed, what would be diminished, what would be enhanced, and what faculty and students in these programs think about proposed moves.

I will comment on those recommendations of which I have knowledge and a particular interest. I am sure many of the recommendations have a solid basis, but I do not have sufficient knowledge to comment. My number one concern is recommendation #4. I agree that the Bush School should be elevated to be more visible with a greater impact. However, that will not be accomplished by a merger with the Department of Political Science. The Bush School is a vibrant entity that in the vision of President Bush is dedicated to the noble calling of public service. One only needs visit with Bush School students to feel the passion and energy of their enthusiasm to fulfill President Bush's vision. Political Science is a department of approximately 950 students, of which 900 are undergraduates. Few of them apply to be a part of the academic programs at the Bush School. So adding almost 1,000 students who have nothing in common with the Bush School will not enhance it. The Bush School is a professional school and to combine it with a very dissimilar academic program does not enhance either. The Bush School is already starting to be more visible by opening a campus in Washington, DC, where it will continue to fulfill its core mission of educating graduate students for a successful career in national security, diplomacy and foreign policy. I have heard criticisms of the Bush School for not providing sufficient revenue and being an economic drag on the university. Even if true, that is a myopic view of the Bush School and the entire Bush Library complex. The prestige and economic benefit of that complex to the university and the community is immense and it should not be changed without considerable additional study and analysis. The question should be "What would President Bush want?" I think the answer clearly is a school of public service so that graduates can make a difference. If undergraduates need to be added, it should be through an undergraduate program developed by Bush School leadership in conjunction with your input. The Bush School has only recently taken over most of the Allen Building to adequately house the current school. To add undergraduates will require additional space and the requisite funding would have to be provided. In closing, a great deal of additional study in conjunction with Dean Welsh and his staff will be required before a final plan for success is developed. Recommendation #2 is to establish a School of Visual

and Performing Arts with new departments of Music, Performing Arts and Fine Arts, of which the Department of Visualization would be the anchor. Start with the concrete proposition that nothing should be done to harm one of the true gems of our university: "Vis Arts." The following question needs to be answered: Can the University be all things to all people? This is a university of 70,000 plus students with curriculum in countless areas, though not music, performing arts and fine arts. I have no objection to any of these, but where will additional funding be found to make these first class academic units of our university? If funding can be found, then proceed. If not, do not take money away from existing programs to add others that arguably do not fit our STEM focused university.

---

I like this concept, I also believe more cross functional collaboration should be incorporated into the learning experience.

---

It is our position as Former Students of the Landscape Architecture program that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation. "Design and Build" is a essential symbiotic relationship that has taken decades to develop into an interdisciplinary approach; fostered and lead by Texas A&M University. To dismember this intentional and successful collaboration between these departments will undo the significant advancements our college has made to insure our students are leaders in this world-wide, interwoven industry. From a more humanitarian view; Designers and Builders sit across the table from one another on a daily basis as we envision, document, specify, bid, construct, and maintain our built environment. Daily. To separate these "trades" that have co-existed since the beginning of buildings and infrastructure is inconceivable.

---

Recommendation #3: Establish a Department of Journalism - =====

Rationale #3 "Recent reports have shown people are more engaged with national news than local news, likely a result of local newsrooms closing and downsizing at expedited rates. Research has shown a strong correlation between lower newspaper circulation and higher rates of corruption, declining civic participation, reduced political knowledge, increased vulnerability to misinformation, and an increase in taxes. "

===== Comment - Who knew all the terrible outcomes of lower newspaper circulation? Corruption! Taxes! Misinformation! Where's the footnote for this paragraph? What's the source of this research? Load of cr\*p..... You read something like this and it makes the whole 100+ page report suspect. By the way, shouldn't that be "Reestablish a Department of Journalism"? At one time we had a very impressive journalism department. That should be acknowledged.

---

Makes sense given our 'new world'

---

As a former Political Science student, I think moving the Department of Political Science as a unit of the Bush School is extremely important to the success of the department. Moreover, it would be extremely useful to undergraduate students to have more offerings in public administration, state and local government, and American politics. Making the department a unit of the Bush School would enable such offerings. As a public library employee, the need for information science courses is greater than ever. However, I do not see a need for there to be specific programs in LIS. The state of Texas has three MLIS programs that are ALA accredited and one more with initial accreditation. There is a glut of MLIS graduates in the state because of the number of programs and it would not serve the university well. Moreover, there is not a well-defined need for bachelors degrees in LIS. All libraries require an ALA accredited Masters degree. A bachelors degree in LIS would be wasted education.

---

I received my degree in English from the College of Liberal Arts. If the College of Liberal Arts is moved to be under the STEM system, there will be no uniqueness or difference between the two colleges. A large part of the reason I loved my college experience was because I had incredible professors who cared and genuinely enjoyed teaching. My husband received an Engineering degree at TAMU and through his 5 years of going to class, he felt he had only 1 professor who actually cared about him as a student and an individual. He felt that the other professors did not care about teaching because it wasn't their priority, and thus, did not care about their students. He and I had very different academic experiences and I fear that if the COLA is moved to be overseen or combined with the STEM colleges, that it will lose its compassion, care, and quality from both an academic standpoint but also a leadership and faculty standpoint. He was 1 of MANY friends of our who were fellow students that got a STEM degree and felt that their academic experience was harsh and that their professors did not care about their students. The arts are meant to be separate and the arts need to

be taken care of because if they are not, it sends a huge message by TAMU that the arts are not as important as STEM which is wholeheartedly not true. I would not have completed by degree or made it through college without my professors and their kindness and compassion.

---

Strongly disagree with proposed move of construction science into engineering college (from architecture). The engineering college already has numerous issues and it would be a bad move to subject CS to all the same issues when it works quite well in current alignment. It is top CS program in Texas already. PLEASE LEAVE WELL ENOUGH ALONE and focus on other more pressing or impactful moves at the university. A "lift and shift" May look good on paper, but implementation will subject current and future students to all of the same challenges of the current engineering college. Bad move, please don't make this move!!!

---

I particularly want to comment on this as a former student, a long term business leader in a technical role, and as Vice Chair of the College of Science External Advisory and Development Council. 1. RECOMMENDATION TO CREATE COLLEGE OF ARTS AND SCIENCES. It is stated several times in the recommendation report that at about 12 of the peer universities that this is the organizational structure. It is important to note that this is not 100% the case. It is also pointed out that this combined college then is generally the largest college at the university. It is also pointed out that this would help a "weaker" Liberal Arts college become stronger. I do not feel that this "consolidation" is the best for the students or the disciplines contained in the various departments in the Colleges. I think focus will be lost and there is such great diversity in the curriculum that it will not be best for continuous improvements in both Colleges. I have seen the strategic plans (completed or work in progress) for the departments in the College of Science. This approach of strategic planning is better to make improvements than to combine the Arts and Sciences. If the Liberal Arts area does not have a strategic plan for their departments, this should be a first step for improvements versus this "reorganization". Whether Geosciences should become a part of the College of Science is something that I didn't have time to study or investigate based on the time to provide feedback. Additionally, every university doesn't have to be good in everything is a belief of mine. You need to determine what are the core things that we want to be good in and be the best in them. I worked for a company that if we weren't one or two in the industry with a product, we would get out of it. I know academia is different, but an assessment of whether A&M should put resources into creating a journalism department, for example, should be more deeply be looked at. Sometimes it isn't necessary to be all things to all people (students). I believe strongly that this combining of Arts and Sciences would not improve the disciplines and thus the education of the students. I think there needs to be strong Colleges around the disciplines (e.g. sciences - the foundational disciplines chemistry, biology, math, statistics.....). There is not a lot of connectivity between dancing and chemistry.....having one college focused that has to deal with such would just not be an effective way to drive continuous improvement and serve the students. 2. INSTITUTE OF BIOLOGICAL LIFE SCIENCES The general concept seems having this institute for the biological sciences to collaborate with agriculture and health sciences (medical). This would also house the Department of Biology. I believe in this general concept to get cross disciplinary collaboration. However, it doesn't make sense that the Department of Biology would then be a part of the AgriLife College. Biology is a fundamental science discipline that is applied to agriculture, health, medical, etc. It should stay with the College of Science it would seem in this model. Additionally, I have for over a year been aware of the initiative to create more synergy/collaboration in the College of Science between chemistry and biology (which would include much needed updated facilities). This concept seems to be missing from the recommendations and this would be an opportunity to go beyond just the biological sciences collaboration to an Institute of Chemical and Biological Sciences that is housed in the College of Science that supports the other colleges that makes use of the fundamental sciences of chemistry and biology. I would be happy to clarify or discuss further if of interest.

---

Academic realignment is always welcome to expand the role of the team

---

I don't feel combining the College of Science and College of Liberal Arts is a good idea in practice and could hamper the learning experience of students from both colleges.

---

Good ideas.

---

I would like to see a bigger emphasis on broadcasting and communication programs. We need more Aggies on television to help promote our great university. We often are lacking in this department, and with the University of Texas joining the SEC, you know they are going to add former Longhorns to their on-air talent on platforms like the SEC Network.

---

Arts should be arts and Science should be science. I see no benefit to combining these colleges other than to perhaps

bolster a weaker Liberal Arts program (my major). It could conceivably weaken the stronger Sciences, as general perception does not put the two on equal footing. I can understand combining Geosciences with a Science dept however. I also see no benefit to offering a large number of additional liberal arts degrees where there is no employment upon graduation. Currently A&M has a strong reputation and statistically strong numbers in hiring of our students after graduation. And I really find the references to what "tu does" offensive. That is why we are different. That is why we have a reputation of building leaders with strong core values. That school in Austin does not. I feel the Visualization degree should stay where it is. It has national recognition. It does not need to "fill a niche". If it is not broke, don't break it. Journalism. A can of worms. There is lower newspaper circulation (and magazine) because people read online. Offering newspaper classes will not change that. There is more corruption because ethics are not taught and a lack of it is even encouraged at the highest level of our government. There are more taxes because our government cannot and will not control their spending. Teaching journalism will not change that. Journalists are part of the problem. They are lazy, lack ethics and have no interest in telling the truth, only in getting out the story. That is who news organizations hire. That is what they want in their employees. That is the opposite of our core values. Understanding journalism terms will not change that. I am not refering to just political stories. When a newspaper prints a story about Delta Airline's DC-10's....when Delta only owns L-1011's....that is incorrect and lazy. That information is easy to look up and readily available. I could give more examples, but I think that explains it. The Bush School is am amazing graduate school. President Bush chose A&M for his library and school because of our core values and ethics. I really do not see an overlap in what it has to offer and the Political Science Dept. If these were to be combined...I feel it would more appropriately refect his vision is Political Science were under the Bush School and the Political Science department were eliminated. (and that was my major). Our University Libraries should stay as they are. I do not feel the research group did any research at all when making their recomendations about the library. Our libraries are highly respected nationally. We have five libraries, each focusing on different aspects of our educational offerings and serving the large student body, the faculty and the community. Researchers from across the coutry access our inventory. Our libraries work with every department and college on campus and have staff with specialized knowledge to work with each department. Tier Research 1 universities all have a centralized library with deans or librarians reporting directly to the provost. As a past president of the Friends of the Texas A&M University Libraries, I have serious concerns about future fundraising efforts for the library by the Friends if the library were to be moved under a single unit that is not representative of the university as a whole. Over \$1.1 million have been raised just since 1990. Most of these donations come from former students from ALL colleges and departments. I agree General Studies should be in the Department of Arts. I feel the Department of Architecture should be left alone. The small animal clinic at the Vet School desparately needs to be improved. The decline in large animal practice rurally is due to several factors. It is physically hard. It does not pay well. While a small animal vet may be able to charge \$200 plus for FiFi's shots and annual exam, none of us would be able to put food on the table if a bovine vet did that. When we take calves in at weaning for shots, worming, branding (and help putting halters on because they have great chutes and usually 3-4 helpers), it costs about \$12-\$15 per calf. I am not really sure how to fix that.

---

I'm writing to express my support for the return of a journalism major, particularly one that focuses on digital journalism. For background, I am a former student with a Journalism degree from TAMU. I am currently a Senior Editor at CNN. The report is correct in identifying people's relationship to national and local news, and the need for a strong and well-funded journalism department. But a new journalism department at TAMU should aim to differentiate itself from its peer institutions. I propose three areas: 1) focusing on digital journalism foremost (agree on need to offer print, broadcast, but in today's media landscape, digital skills are the most in-demand and what will get the students jobs). 2) Emphasize media literacy. Not just for journalism majors, either. Media literacy is such an important skill (I blame illiteracy in this area for much of the spread of misinformation online), that this should be a required course for all students. Maybe even a 1-hour course, but mandatory across the university. The dividends for the state of Texas would be immeasurable. 3) Partner with more established schools and programs at TAMU. The Bush School has built a reputation for international affair. Offer classes in international reporting that can be cross-posted between JOUR and BUSH and meet the needs of both sets of students. I envision collaboration between the journalism and various engineering departments. Giving journalism majors exposure to questions of renewable energy, electric cars, construction -- all media beats that outlets are looking for journalists to cover.

---

My name is [REDACTED], and I earned my bachelor's degree from the Construction Science Program last December. I've spent my professional career to this point doing construction on both commercial and industrial projects in the state of Texas. The curriculum and faculty that currently make up the Construction Science program have been

the two biggest factors in my success up to this point in my career, and I fear that consolidating the Construction Science department within the college of Engineering would deeply impact the experience and qualifications of Construction Science graduates. The construction science program is highly regarded as the premier program for construction education in the state of Texas, and one of the, if not the best construction education program in the country. I believe that the competitive advantage that I have over my peers in the construction industry is that I am not an engineer. Please don't misconstrue, it takes both to be able to put a building together, but engineers can not do the job of a builder. We think differently, and have a very different set of skills. The skills of an architect align more with the needed skills of a construction science student. By an exit survey, nearly 70% of students who graduate with construction science degrees work in either the commercial or residential sectors. These two sectors will work much more closely with architects rather than engineers. I believe that the program should remain in the college of architecture, firmly. Engineering students are design-minded, and not construction minded. The more we blur the line between construction professionals and designers, the less prepared students of the construction science program will be to enter the construction industry. I also fear that the construction science program would be much less accessible to students that come from blue collar families if it were moved to the engineering school where tuition rates are significantly higher. And lastly, the math and sciences required of Freshman level engineering students, and coding languages that are taught in intro Engineering classes would offer little to no benefit to a student trying to be a construction science major. Ultimately, I believe the move of the construction science program at Texas A&M offers very little to the end user of your students, the companies that employ them. I, and many others would truly hate to see a university that prides itself on developing leaders of character, make a move that makes the curriculum of these leaders less applicable in their careers. This move seems like one that would not benefit the construction science program, and only has the reputation of the engineering school in mind.

---

**FRIENDS OF THE TEXAS A&M UNIVERSITY LIBRARIES RESPONSE TO MGT COMPREHENSIVE REVIEW** Texas A&M University — A Tier One Research University Central to the stature of a great research university is the excellence of its libraries. Over the past half century, Texas A&M University has evolved from a small, all-male military college to a highly respected Tier One research university. The culmination of that evolution and striving for greatness was the invitation to join the American Association of Universities in 2001. The AAU member universities—64 in the United States and 2 in Canada—are on the leading edge of innovation, scholarship, and solutions that contribute to scientific progress, economic development, security, and well-being. AAU membership is by invitation only and requires an affirmative vote of three-quarters of current members. The reputation of Texas A&M University continues to increase in concert with the quality of its innovative research and the capability of its graduates. Texas A&M University Libraries As Texas A&M University developed into a Tier One University, TAMU Libraries have concomitantly expanded the depth and breadth of their core competencies and research capabilities. Today, TAMU Libraries effectively serve the research and study needs of both faculty and students across the main campus. TAMU is privileged to have five campus libraries, each with its own specialized functions and collections: ☐ Business Library: Serves the Mays Business School ☐ Cushing Memorial Library & Archives: Special Collections Library and University Archives. Cushing Library is not only a museum of archives. Cushing functionally supports the academic excellence of our students and the research needs of our faculty. ☐ Medical Sciences Library: Serves the Health Science Center ☐ Policy Sciences and Economics Library: Supports the George Bush School of Government and Political Sciences Department. ☐ Sterling C. Evans Library: Main academic library supporting all TAMU Colleges and global researchers. Universally: ☐ TAMU Libraries are interdisciplinary and that is core to our mission. ☐ Our faculty librarians have specialized knowledge, education, and experience for each discipline represented on campus. Further, our faculty librarians provide inclusive services to all 73,000+ students and 10,000+ faculty and staff on campus in addition to HSC Bryan, Canyon, HSC Houston, Kingsville, McAllen, Round Rock, and Temple. Friends of the Texas A&M University Libraries The Friends promote understanding and appreciation of the Texas A&M University Libraries and play a major role in fundraising. Gifts to the Friends support positive student experiences by funding collections, preservation, spaces, projects, awards and much more. Members enjoy events and annual meetings with notable speakers. Since its founding in 1970 by Sterling C. Evans '21, the Friends has grown over the years along with the University. Essential to the Friends' fundraising role is the high visibility of the TAMU Libraries and the Libraries' positions serving the sixteen Colleges within the University, as well as the many Departments which fall under the auspices of each of the Colleges. Folding the TAMU Libraries into a restructured College of Arts and Sciences will dilute the Libraries' core mission. Just as crucial, it will prove inimical to the Friends fundraising efforts. One of the key fundraising "selling points" of the Friends is our targeting of former students based on their history as graduates of the TAMU Colleges and Departments. A total of over \$1.1 million has been raised by the Friends or Friends

related project donations since the donor database tracking was implemented in 1990. This does not include funds raised from 1970 – 1990. In addition, the above amount does not include an additional \$206,000 in two Texas A&M Foundation accounts that are Friends of the Libraries related. In 2018, our non-profit corporation changed its name from Friends of the Sterling C. Evans Library to Friends of the Texas A&M University Libraries. The Friends made this change to better reflect our enhanced mission to serve all five campus libraries. Recent Projects made possible by the fundraising efforts of the Friends include:

- Open Educational Resources Learning Circles: The University Libraries developed a program to advance the adoption, adaptation, and creation of Open Educational Resources (OERs) on campus to enhance student access to higher education and student academic success. To date, the University Libraries have supported faculty use of OERs in 11 courses at Texas A&M that to date have served over 45,000 students and contributed to over 2.2 million dollars in student savings.
- Funded the acquisition of the University Libraries 6th Millionth Volume
- Friends Preservation Assistance Program - Preservation Unit: Supports the preservation of other campus colleges' and units' own special collections.
- Preservation Equipment: High resolution scanners and other related equipment
- Art Restoration: Various paintings in Cushing Library.

In sum, the Friends respectfully propose that the TAMU Libraries be placed within a central organization from which the campus libraries can effectively serve their respective Colleges or, in the case of the Cushing Memorial Library & Archives and the Sterling C. Evans Library, the entire campus. This will serve to refocus the mission of the campus libraries and enhance the funding raising efforts of the Friends.

[REDACTED]

---

I cannot agree. Keep the current structure - just because others are doing it doesn't mean A&M should. A&M's focus has always been on the technical arts and STEM. Graduates enter the job market in high-paying and successful technical careers. I am not in favor of building up liberal arts, whose degrees do not confer the same gravitas with employers and will dilute the University's traditional focus. Texas students interested in pursuing liberal arts degrees have a variety of other choices in universities. Keep A&M focused on what it does better than any other institution in the state!

---

The four as described makes sense. Engineering and AgriLife are dominant schools. But do not let Mays School of Business get held back by the departments within its big unit.

---

I wholeheartedly endorse the recommendation to establish the Department of Journalism. As an '86 journalism graduate when the department existed, and a former Battalion sports editor, so much of what I continue to carry with me as a newspaper and magazine editor today was ingrained in me at A&M. At a time when good, experienced journalism is needed as much as ever, the establishment of a department would go a long way to elevating Texas A&M's prominence in this area. Please establish the department.

---

Although I have heard discontent among other Former Students about creating a College of Arts and Sciences, the details support the alignment.

---

[REDACTED] In 1989 I earned my Bachelor of Science degree in Building Construction and in 2002 I earned my Master of Science degree in Construction Management. I have worked in the commercial construction and industrial construction markets both domestically and internationally. I firmly believe that it was my education at Texas A&M University that gave me the opportunities and firm foundation that allowed me to build my career. The idea of the Construction Department being under the College of Engineering has been around at least since 1988 and possibly longer. Although there are merits to the idea of having the program under the College of Engineering there are drawbacks as well. I am deeply concerned for both the future students and the Construction department if the move to the College of Engineering is implemented. The College of Engineering is well respected in the academic and professional circles. The Department of Construction Science, however, is far and away the most respected construction academic program in the State of Texas and one of the top tier if not the premier program in the nation. There are many reasons that the Texas A&M Construction Science is set apart from its peers including its student base, focus on construction rather than design, broad spectrum of classes rather a focus on a single discipline and its strong relationship with architectural design. The students that choose to pursue Construction Science are not of the same mindset as those that enroll in Engineering. Construction majors are builders that want to be involved in the field, in the daily interaction with subcontractors and trades people. Although they will work with designers to overcome

challenges, they do not want to be designers. They are enthusiastic about seeing the projects come out of the ground and materialize into physical reality from 2D and 3D designs. Engineering students have similar passions but tend to be focused on the design itself and finding the best materials and optimizing the design rather than the construction process. The level of detail in math and science are not the same for builders and engineers. The focus on communications, legal knowledge of contracts and labor law and cross disciplinary training in design aspects are all different. The academic focus of these disciplines is different for a reason and the transition of the Department of Construction Science into the College of Engineering has the significant risk of 'standardizing' the curriculum and forcing Construction Science majors to seek other degrees to avoid the intensive math and science for engineering majors that they will never use in their chosen profession. Likewise, they may be unable to select enough contracts and labor law classes to given them the strong background necessary for working with construction contractors. Lastly, the movement of the construction degree into civil engineering would likely focus the degree on civil and structural engineering and leave out the wide breadth of knowledge required in mechanical, heating ventilation and air conditioning, plumbing and electrical building systems that are just as necessary as civil and structural design for construction majors. Although there are certainly merits to the movement of the Department of Construction Science into engineering for efficiency reasons, I believe firmly the move would hurt both students that do not want to pursue an engineering degree in order to become a builder and it would weaken the construction industry as it would lose the best source of well trained and well-rounded construction graduates.

---

Context: I received a BS: Dance Science and a BA: Mathematics in 2015 and a M.Ed. in Curriculum and Instruction in 2017. I also held the Student Worker position for the dance program from spring 2013 - fall 2015. The recommendation to create a College of Art and Sciences to bring together the arts at TAMU (Dance Program, Visualization, & Performance Studies) is alluring because it would more easily allow students and faculty to collaborate. This collaboration already happens across colleges now, but the proximity of leadership and students would only increase that ability. My only reservation for this move is that the dance program would not be able to maintain its dance science foundation. The science aspect of the degree program was one of the main selling points for myself as a prospective student. It is the first program of its kind in the nation and has presented research as high as the international stage. If this move to the College of Arts comes at the expense of the science and kinesiology research for the program, then the University should really rethink that move. Additionally, the dance program is in desperate need of more faculty members to continue to grow. If the program (especially in the potential future College of Arts and Science) is asked to add more to what it offers to students beyond the dance science degree, then the faculty needs to increase to meet that demand. This way, the arts can be well represented evenly across the three departments: dance, Visualization, and performance studies.

---

As a former student who graduated with a Biology degree, I disagree with the recommendation that the colleges of Science and Liberal arts be consolidated. If there is not a need, do not change what is working.

---

I have significant concern about allocation of resources when combining Liberal Arts with Science. The funding sources for research are much different and for Science, it is critical that adequate funding is available for bringing new tenure track research faculty to A&M as well as retaining high performing faculty. Similarly, the refurbishment of existing facilities and access to high cost equipment is a necessity--A&M has to be on the forefront of new technology and that is expensive.

---

I wanted to voice my support for establishing a journalism department. As a journalism graduate, it has been difficult to watch the department be eliminated, and then the journalism major brought back in a lesser way. The value of journalism can't be overstated. It's unfortunate that Texas A&M has produced so few journalists in recent years, while the other major universities in the state give journalism more emphasis and resources. The industry is certainly changing. A department that embraces traditional print (newspaper and magazine), digital (web and social media), photography, videography, television and radio would allow students to learn about that evolution and move forward. Most of all, the ethics and values in reporting the truth are crucial in an age when facts are twisted and opinions are viewed as facts. I sincerely hope the department is reestablished, with the resources needed to give it a strong foundation and room to grow. Thank you.

---

PLEASE PLEASE PLEASE PLEASE PLEASE PLEASE keep A&M a CONSERVATIVE school!! Texans need to have that as a choice for their children. There are plenty of other choices if you want a liberal school. PLEASE keep the A&M conservative values in place. This DOES mean that all are welcome; no one is excluded AND A&M keeps the conservative values. My husband and I are Aggies ('91 and '92) and have FIVE A&M Students ( '18, '19, '21, '23, '23) and we are so very sad to see the crumbling of A&M conservative values in recent years. We have raised them to know that ALL AGGIES are valuable and ALL AGGIES are important and you treat ALL AGGIES with kindness and respect. And yet the

divisiveness brought by some groups is ridiculously allowed by A&M. The loud, over-the-top, intrusive, disruptive cheering nonsense that is allowed at graduations needs to stop. Parents are prevented from hearing THEIR OWN CHILD'S NAME called because of it. They really have earned that small right to hear their own child's name announced as they cross the graduation stage. Please impose a HEFTY fine on anyone who prevents others from hearing their own child's name called, AND ENFORCE IT. We have even seen parents miss the view of their child crossing the stage because these selfish individuals are dancing and jumping right in front of them. Heartbreaking and WRONG. PLEASE get rid of [REDACTED] and all he stands for. PLEASE look carefully at what Fish Camp counselors are teaching.... Fish Camp grew worse and worse through all our five children's attendance there, and was an unmitigated disaster for our youngest two. If we had more children to go to A&M, Fish Camp would no longer be a part of their experience, sadly. In fact, we wish we could say we still recommend A&M to others when they ask us how our experiences have been with our children there since 2014, when our first went with hope and enthusiasm to A&M. Let's suffice it to say that we are watching carefully and praying that the A&M we know and love will return.

---

As a former student and a strong supporter and past president of the Friends of the Texas A&M University Libraries, I would like to share my thoughts on moving the libraries under the proposed College of Arts & Sciences. I urge you to reconsider this recommendation! Due to their broad reach and varied responsibilities to support many curriculums, the TAMU Libraries do not need to be "filed" under one specific college. They can serve the students much better by working from a broader scope. I also feel that having the libraries under one college will hinder our ability to garner donations for the libraries. We currently are able to appeal to all former students based on their college association which has been a great attraction to donors. We have made great headway in sharing the importance and the prominence of the Texas A&M University Libraries with our former students. They are impressed and proud of the number of volumes, the student resources and spaces that are provided, and the integration of the special collections of the Cushing Library into the curriculum of many classes. This brings up my final concern of making Cushing Library a museum. Cushing is most definitely not a museum. Cushing houses collections that have been thoughtfully donated by individuals that specifically chose Texas A&M for their collections because they wanted them to be used in classrooms to teach students. It would be a grave mistake and a let down to donors, many of whom we hope to develop into continuing donors or possibly leaving a gift to Texas A&M in their will, to change the purpose of Cushing Library. I have thoroughly enjoyed my association with the Texas A&M University Libraries and working the faculty, staff and other volunteers. The libraries are what I consider to be a "gateway" to gift-giving to everyone who attended Texas A&M because most every student at one time or another used one of the libraries while at A&M. This isn't always the case with sports or other specific interests. I hope you will consider my heartfelt comments to maintain the libraries at Texas A&M in the broadest sense possible, and allow us to continue our good work in garnering support for Texas A&M.

---

As a former student of both undergraduate and graduate degrees in the College of Architecture, I am deeply concerned and disappointed with the Report's findings and recommendations regarding the College's realignment. The "refocus" of the College, especially the removal of the Construction Science department, would only devalue the architecture side of the College even more by eliminating a unique characteristic that sets it apart from "peer" universities with its collaboration between architecture and construction science students (which happens to be the closest industry relationship in the real world). I also fear the massive decrease in funding from the College if partners of CoSci are reallocated to the College of Engineering, which is already the largest and most lucrative college in the university. I spent six years in the College of Architecture, earning my Bachelor of Environmental Design and my Master of Architecture. I was a teaching assistant both years of graduate school, worked closely with multiple professors, participated in research, and did so while graduating Cum Laude in undergrad and with a 4.0 in graduate school. In my entire time there, I saw many things the College could improve on, especially in terms of the architecture programs seemingly lacked the flair of other universities' programs and even compared to Visualization and Construction Science. But removing those two programs from the College would do nothing to alleviate those problems. I learned more real-world application from my collaboration in two studios with CoSci students that has served me better than most of my other colleagues at work in being able to design buildings and work with our contractors that actually construct them. A&M's architecture program is not as "aesthetically design-focused" as a Rice, Cal Poly, or the university of Texas, but I would venture to say the two reasons A&M students get hired in more architecture firms in Texas than these others is because A&M graduates come into the workplace with real experience (driven by a collaboration with CoSci and an emphasis from professors on construction drawings, details, and practical application) and they have and know how to grow a network of professionals and students from around the industry. As far as Visualization, in my in-depth collaboration on a study abroad program as well as in other classes, I was able to be influenced by the unmatched creativity of the Viz

students and apply it to my designs in architecture. Without this, another (and perhaps the best) outlet of creativity is removed from the College of Architecture. Removing the CoSci and Viz departments only weaken this strength that sets A&M apart.

Merging of colleges with an addition of the possibility of centralizing everything around the sun seems like a mess for so many people. We need to think about the PEOPLE. How many people will the university lose with these drastic changes in less than 12 months? Not just with centralization but with people leaving because of things changing or those retiring early to prevent seeing the things that will happen. How is this actually going to benefit the university, because there is no actual way this will be a "smooth" transition. Students, faculty and staff are on edge and stressed because there has been no talk about ways of implementation. Many feel that the rug was pulled from under them. How can a university of 70,000+ students make changes in less than 12 months? Another Aggie core value loyalty. We are supposed to be there for one another and that means listening to the concerns of people that are not just students but also former student, staff and faculty. Taking away the largest major of architecture is only a gain for engineering as their plan is to have 25,000 student by 2025. We are not just an engineering school we are a science, health, veterinary, agriculture and so much more. Construction science is in architecture because it is part of the architecture industry. We don't just take from another department to gain in another. Who do we stand for? The students or for the engineering school? If we were MIT or Franklin Olin College I'd understand the focus on engineering, but that is not who we are. We house 93 majors only about 15 are with engineering, and about 16 with agriculture. Why isn't the same mission for Agriculture as it is for engineering?

I do NOT believe the Department of Construction Science should be move out of the College of Architecture.

One of the strongest pillars of the Bush School is the small class size and its limited focus. I understand increasing the scope of the school, but I think it will be imperative to not lose the exclusiveness of the school b increasing its size.

The recommendation for the College of Arts & Sciences seems to be offered because other benchmarked institutions are structured in this way. It seems to be an "all other" organization. There are recommendations to add degree plans and degrees for consistency with other universities rather than because TAMU has a core competency in that particular area. TAMU should only be expanding degrees programs because there is a need in public service, private industry or academia for those degrees. Otherwise, TAMU risks becoming another of those schools providing degrees that leave students in debt with few job opportunities, damaging the high value-for-money education rating that TAMU constantly achieves.. Combining Political Science with an excellent Bush Public Service program seems to drag down the Bush program. Removing Visualization from Architecture to bolster an expansion in the Arts risks damaging an existing world class Visualization program to expand an Arts program that has not been a core competency of TAMU. Adding a Library Sciences degree program to University Libraries misses the core competencies of the University Libraries with a preservation program that is the envy of other institutions, an excellent resource access program, targeted and highly demanded collaboration spaces for students in all majors. University Libraries is better placed within the Provost organization given the extensive service/support provided across all college curriculums.

As a former student of the College of Architecture, I support the moving of the Department of Visualization to the new College of Arts & Sciences due to the unique needs of this program which have grown increasingly deviant of the other academic units within the College of Architecture. However, I am much more reluctant to recommend the movement of construction science to the Department of Engineering unless if significant ties are kept between the program and the College of Architecture, due to the extensive real-world professional ties between the architecture and construction industries. As a practical matter, as a professional architect, I have found many of the relationships which I built with peers in the construction science department to be extremely valuable as I have entered the professional world.

The idea of moving the library to just one college when they serve all the colleges needs more study. The medical library exists specifically for professional programs, the veterinary college, etc.

If the department is so small in journalism, why have it at all? The Mays Business school study is important to determine if journalism fits with advertising, I do not think so. Moving Bush makes sense and building awareness of it. Institute of biological life sciences as outlined makes sense. No opinion on Library Sciences. 9a is important. As an employer, when I see a degree in general studies, I pass on that person. Agree with College of Architecture recommendation.

NO! A College of Arts and Sciences is absolutely not a good idea. TAMU is not a liberal arts school. Expand Liberal Arts if you must but leave science alone. Combining the colleges will lessen the value of the Sciences. Other universities that have combined Arts and Sciences have seen a dramatic reduction in funding for the Sciences. This is a catastrophic idea.

The college of architecture benefits from having both departments of visualization and construction science in their college. As a landscape architecture graduate, I feel that the basic College of Architecture classes were a great foundation for our majors. The urban planning classes really prepared us for the multi-faceted relationships and theories we face in design. Now as a professional, I see that there is a wide disconnect between construction and design. Our careers would benefit from having more engagement starting early in our college careers. It would be even better, for our courses to have more connection, as design cannot happen without understanding constructability, and timelines.

Adding the Arts to the Sciences makes little sense to me, and isn't consistent with my view of the University's mission. Journalism is dead/dying, and the fact that this report seems to elevate it demeans the value of the study.

As a graduate of the College of Liberal Arts, I support any recommendations that would boost its stature and advocacy. I totally understand that A&M was founded on Agriculture and Mechanics but I think we have moved beyond that at this point. Liberal Arts should be given the same level of support as Science based studies. I am extremely passionate about growing and investing in the arts. This area has been under valued at A&M for far too long to our detriment. Anything that can be done to support artistically-inclined students, should be implemented. I graduated with a degree in Communications and minor in Journalism. I also worked at The Battalion while I was a student. It's my opinion that one of the reasons Texas A&M is not as well known as it could be or should be, outside of football, is the underrepresentation in this study. I entered A&M shortly after it initially discontinued the Journalism major. I believe that was a huge mistake. We missed out on training and producing a generation of journalists. Other universities, most notably the UT, have numerous prominent journalists as alumni. This also serves as a recruiting point for them. I agree with everything stated in this part of the recommendation.

Finding 1. Do not agree with combining Liberal arts and Sciences into a combined college for the sheer purpose of size. The study referenced Michigan and Florida as peer institutions to look at for this purpose, that's just not a strong enough argument for housing these under one college. What are we losing out on now by keeping them separate? If you want to round out our science degree students, have them take a business class for future success.

Recommendation 9A. The entire concept doesn't make any sense. The impression is The University is simply putting a degree title under "Arts and Sciences" to add significance to it. From an employer standpoint, a simple question, tell me, exactly what did you get your degree in? We hire someone for a specific discipline/job. How does a "general" studies degree really help a student succeed in the real world? The answer - it doesn't. Our degree stands for something. Please do not water it down. Let's instead encourage our students to find a degree suitable for their interests. Also, we should not create incentives to increase enrollment for the purpose of just cranking out degrees, that will also dilute our brand. Let's be more deliberate with the amount of students we accept and uphold our standards.

I support the recommendation to move the Construction Science Department to the College of Engineering. As noted in the report, there are significant connections between construction and engineering disciplines. The Construction Science Department is the largest and one of the best in the nation and would benefit from being linked to a college with such prestige and respect.

Texas A&M is a great STEM institution. Vision 2020, which was written and adopted in 1999, put us on the strategic path that allowed to be recognized today as a premier Tier 1 teaching and research institution. Let's continue to be great at what we are and can become. Yes, combine the Colleges of Science and Geosciences BUT DO NOT combine these STEM colleges with College of Liberal Arts. We need to expose our undergraduate students to the liberal arts but we do not need to invest heavily in liberal arts at the expense of our deep science teaching and research. Do your homework -- top tier universities today that combined Science and Liberal Arts years ago are trying to find support and funding to split those two colleges. Texas A&M does not need to fall into that same pothole! There are plenty of good public and private universities and colleges in the State of Texas that have adequate to excellent liberal arts degree programs. Texas A&M is not for everyone and it should never become the university of choice for all majors. Texas A&M did not become a Top 10 research university because of our history or English departments. Learn from many of the successful private enterprises run by successful Texas Aggies -- decide what you are good at and be better than everyone else in those chosen fields -- focus; do not dilute! The four-legged foundation of AgriLife, Engineering, Arts and Sciences, and Texas A&M Health sounds really pithy and smart but it is highly impractical and would constrict the strengths of Texas A&M. I have already mentioned many of the reasons for not creating a college of Arts and Sciences. Texas A&M Health sounds really good but this, too, is not a wise path for Texas A&M. Look back on the problems we have had building a respectable medical school and teaching clinic. The Brazos Valley's population is too small to develop a teaching hospital or clinic with enough patients to provide the teaching experience today's medical professionals need. This concept also dilutes the great work being done by our College of Veterinary Medicine and

Biosciences and programs like ENMED. Keep building on the past success of these programs but stop wasting money and energy on creating a nationally recognized medical school and teaching hospital. The four-legged foundation of AgriLife, Engineering, Arts and Sciences, and Texas A&M Health is flawed also because it leaves excellent colleges like Mays Business School and College of Education & Human Development outside of the key strategic priorities for the University going forward. Mays Business School 20 years ago was virtually unrecognized nationally. Today, it has the #3 accounting department in the country and a finance department ranked in the top 10% of all 729 finance departments in universities and colleges across the country. We need our business school to be linked with our great engineering, science and ag programs. Many of our science departments need to improve their overall rankings and prestige and the Human Development parts of the College of Education may need realigning (e.g., Kinesiology goes to College of Science and HR goes to Mays Business School), but these two colleges are important parts of Texas A&M and our ability to lead and influence the State, nation and world. The State of Texas needs teachers and administrators educated by Texas A&M while learning the importance of the Aggie Values and teaching them to K-12 students. Department of Journalism: It is ok to have a degree in journalism but we should not spend money developing a major department with the naive thinking that Texas A&M can change the face and tone of the news media. I spent 10 years as the CEO of a very well respected news media company trying to help local journalism survive. Unless you have been in the industry, you cannot understand the challenges and why local news media looks like The Eagle and local broadcast TV. Lastly, we do not need to build another degree program that allows students to graduate with a degree for an industry that has an average starting salary of \$25,000 and a overall average pay of \$37,500.

---

Overall, combining and hopefully decreasing administrative personnel may be efficient but some programs and colleges are so unique that to be swallowed up by being placed with other colleges would dilute their uniqueness and may be detrimental to their student population. Specifically, the University Libraries and especially Cushing Library should be a stand-alone entity. The University Libraries service ALL students, on campus and off. Their purpose and scope deserve more than to be lumped into a newly created College of Arts and Sciences. Their presence should actually be enhanced because of the educational impact they have on student learning and success. They are vital to the mission of a quality education and the needed critical thinking aspect of a successful member of society. It seems that the writers of this study did not research the function and mission of the Cushing Library. It is singular in the benefit it brings to all students, faculty and researchers.

---

None

---

Recommendation #9c: Architecture is a very broad field in terms of the types of jobs that our graduates can perform from designer to producing construction documents to construction administration and beyond into the roles of contractor or subcontractor or developer. The heart of being an architect is understanding how buildings go together which includes construction techniques, materials, process and costs. All of the concepts the construction sciences program teaches are part and parcel of what an architect must understand and architecture students need as much understanding of construction as they can get. Its what enables us to tie our dreams and visions to reality. I believe that the two programs should coexist and be integrated as much as possible. This opinion comes from 40+ years as a licensed architect in private practice.

---

Although, I am not on the PAB I agree with their perspective on Academic Realignment. The proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

I have to admit I was skeptical about realignment. However, after reading the details of how the university is currently organized I found the proposals to be well thought out and on sound footing.

---

Finding #1 - I'm not sure what to think here. If this is done, would be because it's best for TAMU or because it's the way other universities do it? Finding #2 - NO. Others do it, so we have to? This is not what TAMU is, nor even close to what a land grant institution is about. Just wondering: why is the Rationale for this proposal five paragraphs long and a full-page, compared to the length of most other rationales in this report? Finding #3 - TAMU does not NEED a Journalism Department. Let's put our \$\$ into making us better in our current major studies of Engineering and Agriculture. This is just another finding that says if other schools do it, then we must do so too. Finding #4 - Okay, but let's do it because it's

a good thing for students and NOT to "become the highest-ranked and most visible School of Public Policy in the nation". Finding #5 - This is the first really good recommendation in this section of the report. Finding #6 - Okay. Also a good one. Finding #7 - Okay. Appears to be a good recommendation. Finding #8 - Okay. Lot's of \$\$\$\$\$. Finding #9a - Okay with the recommendation. Finding #9b - Okay, but reports are that we have abandoned TAMU's large animal veterinary medicine. Finding #9c - Okay. Appears to be a good recommendation. Finding #9d - Okay. Appears to be a good recommendation.

---

The biggest piece that spoke out to me was the recommendation and advocacy for the Visualization Program. I graduated from the program in dec. 2019, and currently work at Lucasfilm Animation. Many of my peers now work for other well known entertainment companies such as Walt Disney Animation, Pixar, Marvel Animation, DreamWorks, etc. our impact on society can be quite large, some of the character you know and love where created and made possible by Aggies, helping create the next generation of hero's, princesses, toys, and memories. But while our program one of the most unique programs in the country, and specifically special that it is in Texas and not California like most art schools. yet, our program is placed in a building with no filtration system for the air conditioning, power cords hanging from the ceiling, and limited resources. When I was a student I remember a few of my studios classes simply didn't have enough chairs for everyone, so it was often a race to get there early enough for a seat so you didn't have to stand or sit on the floor for the entire class. We all shared one or two computers per group, which consisted of 5-7 students. This became a huge issue because while some work can be done on a personal laptop or computer, much of the work needs access to the viz pipeline which is only accessible on a school connected computer that is part of the pipeline. Viz can continue to be successful and a huge pull for a&m's success if it was simply funded as such. I hope the review about viz is taken seriously, or the program is will continue to fall. UTD is building a very strong and competitive entertainment program, and if viz continues to be underfunded, I have no doubt we will lose future students to their program.

---

Realignment of the Constructions sciences out of the College of Architecture into the College of Engineering is an old school mind set that reshuffles the deck chairs on the Titanic. Rather than moving programs from one silo to another because "other universities like us have done so", the university should be considering the development of a forward thinking vision that creates a College for the Built Environment that integrates under one umbrella the disciplines of urban design, architectural and landscape design, architectural engineering and, program management, project management and construction. By example, this college could include programs for research in architectural and engineering product development that will be needed to achieve a truly sustainable and healthy environments. It could also lead in rethinking how we reinvent the entirety of how we live on our planet going forward. With creativity and focused intent on the future this approach could position A&M as a world leader in the creation of totally integrated, sustainable and healthy environments for all.

---

The proposed academic realignment seems reasonable and appropriate. However, I do have a few comments: 1) It does not appear that there is any discussion in the review with respect to the Mays Business School. For example, am aware that Mays offers a degree in Supply Chain Management while TAMU has an entire department of Industrial Distribution which seems to be very similar. If not already in effect, collaboration seems appropriate (for my limited perspective). 2) From my perspective TAMU has traditionally had a low profile with respect to our arts curriculum and it would seem appropriate to make an attempt to bolster the breadth of our programs. However, it is my understanding that TAMU does have a level of respect in the field of animation, but I am uncertain of what program or college is promoting such expertise. 3) Journalism was dropped from the curriculum many years ago and a strong effort should be attempted to implement a respected program. 4) The affiliation of the Department of Political Science with the Bush School seems to be a natural fit. (I am on the advisory board of the Bush School.) However, we need to be sensitive to any issues that might arise with respect to the Bush family. In addition, the Bush School has traditionally been successful in attracting extremely high profile deans (Bob Gates, Ryan Crocker, Andy Card, Mark Welsh) and it would seem appropriate to structure such an alliance so that we are able to continue such a tradition.

---

The Colleges of Science and Liberal Arts should not be combined. That would be like mixing oil and water and would not be beneficial to either.

---

Our construction company heavily recruits the Construction Science Department. I believe moving the Department to the Engineering School will make the Construction Science Program weaker and produce less attractive candidates for construction companies needs.

---

Na

I think the academic realignment, particularly the points related to the performing arts, are a great idea. I was getting my degree in theatre was the program was being phased out and morphed into "performance studies," which means absolutely nothing in the professional arts world I graduated into. The recommendation for the music and theatre departments to work together more could have resulted in something like support for producing a musical as opposed to simply cutting the programs. This mid degree cut back hurt me as a student, but the loss overall hurt the entire community of Aggies and the BCS. It resulted in the loss of talented professional faculty who could have been an asset to the school, community, and students in the years following. I am thrilled to see the push to bring back music and theatre, as well as dance in a more robust fashion. I hope students get to use that beautiful liberal arts and humanities building! My hope for the future is that the dean of this new school would have the knowledge and drive to both listen to and go to bat for the students, which the [REDACTED] did not care to do despite us raising our concerns. The department of library sciences is also a great idea in a world where information professionals are growing more and more important.

---

Recommendation #9c. I disagree with relocating the Construction Science Dept from the College of Architecture to the College of Engineering. While it is true that the COSC program relates heavily to the engineering studies, there is much to be gained by having the COSC students under the same roof as the architecture students. One of the major problems in the construction industry and design profession is the adversarial relationships that often occur between designer and builder. Being within the same "College" offers the design and construction students opportunities to see more of each others work product and to appreciate each others challenges. Hopefully it would instill more of a team approach between the two disciplines. I received an Architectural Construction degree in 1963 but spent my entire career in an architectural office. My education on the construction side was of immense help to our architectural practice as I could relate to both the designer's side and the builder's side. I fear that moving COSC to the Engineering Dept would foster a wider gap between designers and builders. My comments are based on what is better for the construction industry. I am sure that moving the COSC Dept to engineering would make much sense in many ways, both academically and logistically, but I feel that the end product of the design and construction graduates would suffer.

---

As a Construction Science graduate, and a professional in the construction industry, I do not support the recommendation to move the Department of Construction Science from the College of Architecture to the College of Engineering. Most graduates of this program enter the commercial construction industry where we work closest with architects. It is beneficial for these programs to have a shared home. The program has been recognized as one of the best if the nation, and top in our region, while its current curriculum has been developed while in the College of Architecture. Moving to the College of Engineering would not improve the program, and may cause unnecessary competition among the Construction Science program and the other engineering disciplines. Graduates of the Construction Science program are not engineers, we are builders.

---

Seems like there's is a lot of new positions/departments/colleges being recommended for creation yet many consolidations/mergers. Typically a merger there are many who do not retain positions and is detrimental to the most important assets a company has - employees (in this case faculty and students). Yet it can be justified in the best interest of the university.

---

What a disaster would result by combining the college of Arts with Sciences or Geosciences. These are entirely unrelated and would create an atmosphere of frustration at the least. Consider if an Arts person were to become dean. Arts never will receive the amounts and number of grants for research that the sciences will, and believe me, they won't want to have to answer to someone in Arts about pretty much anything. The science departments have Nobel prize winners, a national reputation, and so much more than Arts, that there are bound to be turf wars, petty jealousies, disparate goals, and more, which simply must be avoided.

---

I support the move of COSC to the College of Engineering. I think the program, students, and industry will benefit greatly from it especially in the Industrial and heavy sectors which don't always look to COSC as a viable pipeline of talent due to its position in the College of Architecture. As a graduate of the program, I can't see any downside to this move.

---

Howdy! I am class of 1995, my husband is Class of 1994 and we have 2 sons currently enrolled at Texas A&M, one who is a part of the Fighting Texas Aggie Class of 2025 and loving every bit of Aggieland as he experiences his first semester on campus. He is a Construction Science major and loves the faculty and advisors in the COSC department and the smaller size of the College of Architecture. When we read the suggestion for COSC to be moved to the College of Engineering, we were not only concerned but disappointed. I have thought long and hard about how I wanted to explain my feelings from an educated, factual perspective but I find it simply comes down to family. Although highly esteemed and

regarded, the College of Engineering is substantially larger and I am concerned the family feel of the Construction Science department will get lost in the transition. I could go on and on about future graduating classes having to enter as freshman into the ETAM process and ALL that entails and the current COSC students' uncertainty of not knowing how this will affect them in years to come. And even if/how the engineering students would view/receive the COSC students as they are family, albeit large, of their own. From the minute we sat down in the Architecture Building at NSC, we fell in love with ALL of it..the buildings, the advisors, the staff, the professors and noticed the instant connection of the freshman as they realized they would be in classes together from Day 1. Please strongly consider leaving the Construction Science kiddos right where they are, in the College of Architecture, because it already feels like home to them. Thank your leadership and consideration. Gig 'Em!

---

The proposal for the college of architecture makes some sense. But I am not sure I understand why architecture, planning and landscape would stay as an independent college. Given the size and scope of other colleges, maybe it would be better to have them as a school within a college. For example at Ohio State where I served as the head of the planning program we were in a school of architecture (planning, landscape and architecture) in the college of engineering. It wasn't perfect as there was always helping our engineering dean and colleagues understand the work of the school there were benefits as well. Another option would be to move planning to the George Bush school many planning programs are paired with policy programs. I am at the University of North Texas and our planning program is with public administration. While I don't oppose the reorg as proposed these are just a few other options you may wish to consider.

---

I am [REDACTED], Class of '94. I am also the owner of [REDACTED] a regional private homebuilder in Texas. We are an active company involved on the Construction Industry Advisory Council of the Construction Science Department in the College of Architecture. I want to express my deep concern over the consideration of moving the department of Construction Science from the College of Architecture to the Engineering College. My family and company have donated over \$3,000,000 to the COSC department during the past 15 years. Additionally, we serve on the Industry Advisory council, as well as, hire many graduates from the program. The program is thriving and enjoys incredible support from the industry. Much of this is due to the way the program is positioned within the current college. I implore you to NOT move this program to the Engineering College. You will lose support from the industry, as well as student interest. Currently, the construction industry is filled with Aggie graduates and leaders. I know of no industry executive that supports this recommendation. Please do not move forward with this! [REDACTED]

---

In our quest to world renown, I am not sold on adding more & more programs to be like other institutions. You mentioned journalism... the current mode appears to be say it, make it up, not interested in facts just sensationalism. Who is going to vet the professors design curriculum, talk about ethics. Art can enrich & divide...a concern Support library science changes & small animal ideas but as an agricultural school large animals important also.

---

I have great concerns about the proposed academic alignments in various areas. The "four legged stool" of four super colleges could easily result in a number of unintended consequences. I don't quite get the logic of combining the College of Liberal Arts and Sciences. Does one from the arts or one from the sciences lead the College? I agree with the establishment of a program in visual and performing arts including fine arts, music and other performing arts. rather than moving Visualization from the College of Architecture to join these new initiatives it would seem more practical to locate them in the College of Architecture as exists at other universities strong in the arts. Similar areas of concern, such as Department of Journalism and new Institute of Biological Life Sciences seem to require more careful study before acting. The suggestion to refocus the College of Architecture by moving two of its four departments to other Colleges makes no sense at all to me and seems to be a bit regressive. Fifty years ago architecture, landscape architecture and building construction was part of engineering. When it became a college it began to flourish in the industry. Graduates of the various departments (including the visionary adding of Visualization) were, and now even more highly sought commodities in their various fields nationally and internationally. [REDACTED]

---

[REDACTED] I don't agree with the assessment of how Architecture ranks among its peer universities. The ranking of programs in Design Intelligence is highly flawed using little metrics other than asking heads of architectural and landscape firms to rank 1-15 as to where they get their best graduates. This come no where close to the method used by other rankings such as U. S News and World Report. Since Architecture has become a College, graduates architects, landscape architects and constructors from the college are CEO's an executives in the leading design and construction companies worldwide. There have been four Presidents of the American Institute of Architects, five Chancellors of The AIA College of Fellows and six recipients of the prestigious

Kemper Award. Similar leadership recognitions exist in graduates from Construction Science and Landscape Architecture and Visualization. The building industry has benefited greatly from hiring graduates from programs that have Architecture and Construction Science co-located. The collaboration between designers and constructors is critical with project delivery now emphasizing Design/ Build and various forms of Integrated Project Delivery. Construction and Engineering are different animals. The College of Architecture is not a stereotypical school of architecture. It is focused on collaboratively building communities, resulting in environments that sustainably support all aspects of human endeavor globally.

---

Recommendation #9c: Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning To assist with more focus in Architecture and Landscape Architecture & Urban Planning degrees, relocate the Department of Construction Science to the College of Engineering and the Department of • Future Acquisition of Talent – The Construction Science Program currently caters heavily to the building construction industry (“vertical construction” for purposes of my email). In fact, in the period report by the department, over 85% of the students went to work for building construction related firms in the commercial (63%) and residential (23%) industries. If the department were moved to the College of Engineering, the building construction industry would be “competing” with a much larger variety of industries. This could place our industry in a challenging recruiting position at a time when our workforce is already diminished and strained. • Academic Emphasis – At other universities where their construction management program is housed in engineering colleges, the curriculum is vastly different than that of what our program possesses today. Much of the curriculum in engineering colleges lacks key elements that have been developed in Texas A&M’s current curriculum specifically for the commercial and residential building construction industry. • Interdisciplinary Collaboration with Architects – In the commercial building construction industry, architects are the primary hub for the design team. Moving our students out of the College of Architecture would distance them from students in architecture creating an inconsistent environment than what exists in our industry. This collaboration is already challenging to implement in the higher education model and would be worsened if this move were implemented.

---

I graduated from TAMU 50 years ago, in my mind A&M has always been a hard science school. Fifty years ago, little was offered in the "Liberal Arts" and soft sciences. It looks like you are trying to replicate the University of Texas. While I am not adverse to thoughtful Academic Realignment, recommendations 1 & 2 suggesting major expansion of degree programs in Music, Performance Art, Dance, Fine Art etc. is an adventure into fields far from the historic educational mission of TAMU. While I can appreciate the Fine Arts and their cultural benefits, expansion of these study programs represents a loss of focus for a University whose strength has always been in fields of hard science and its practical applications. It will take years to become highly ranked in these fields and other schools already currently offer excellent programs. TAMU would be better served by concentrating on areas where we have the greatest historical strength, Science and Engineering, or the most potential to become world class. A good example of obvious potential would be the Department of Visualization. I'm reminded of the saying, "Jack of all trades and Master of none."

---

Removing COSC from the COA would be a disservice to both. I understand the academic affinity to Engineering. But in the real world, in the field, actually building things, construction science and architecture are much better served having a mutual understanding and appreciation. Separating them, is a step back toward the traditionally unfortunate adversarial relationship of Architect and Builder, e.g., Cat/Dog, Oil/Water. The right thing is to seek greater integration of construction and architecture, not less. Understanding that three dimensional dreams in the built environment must eventually be reconciled with the practicalities of implementation, is as critical as understanding that cost and logistics are not antithetical to creativity.

---

Absolutely agree that the Journalism degree needs to be brought back. On the University Studies degree - this will only work if the students have access to classes. My son is a graduating senior, University Studies - Leadership with minors in Entrepreneurship and Business. While trying to pick his Entrepreneurship classes, he was extremely limited because Mays and other colleges wouldn't allow him to register for those classes. If this change is done then more options should be provided.

---

Heartily disagree with the rationale for moving Construction Science into the Engineering College. I have a letter written to the College back in 1985 when I found out they were discontinuing the program under which I graduated that speaks directly to this. Would love to share that as well as my perspectives over the last 35 years spent in the Construction and Architecture field. I believe the recommendation within this initiative is the last link in a connection that will very much devalue the opportunity for the cross educational opportunities at a close level between the two fields. I am a registered architect that my 40 years in business were profoundly impacted by the unique combination of programs

within the College prior to 1983 that will virtually disappear completely if you choose this path.

---

Regarding the departure of COSCI and Viz and reorganization or COA, I think it's a good move. COSCI has always been more engineering than Arch, and Viz is far more artful than Arch. In general I firmly believe the Arch program has too much emphasis on "art" than architecture, planning, and design. I would like to see the Arch program become more technical and more applicable to real world architecture. Hopefully this realignment will help further this thought process.

---

The suggestion to move ARCO and VISUALIZATION out of the College of Architecture is a setback "to the way it was" of more than 50 years. The built environment is made up of many facets and Design/Landscape/and Construction was the genesis of the present College of Architecture ever since the move from the 4th Floor of the Academic Building to the current site of buildings. The profession of Architecture has changed drastically from the days of a stubby pencil and blank paper on a drawing board. Today's designs prepared for construction are all done in CAD - computer aided design - thus the formation of the Visualization program which is Computer Aided Design on steroids. Even the profession of Architecture has bridged the used to be chasm from Working Drawings and Bid Documents by inserting a piece called "construction management" which really is to provide a watchdog on going over budget and requires the oversight of design through construction. To separate these fields into separate colleges defeats the purpose of teamwork and oversight. In addition, the current trend to "fast track" design-construction makes the two disciplines even more needed to team and work together. While there may be some ARCO focused people who want to obtain a PE, it has been my considerable experience that even with a construction background the road to a real honest to goodness recognized "profession" is still getting a license in Architecture. The same might be said of Visualization as every firm now bases it's drawings and drawing files on computer aided design. Every young intern starts in an Architecture firm on the bottom step of the licensing ladder - which requires CAD skills or that person will never advance toward licensing. As it happens, I personally have an ARCO BS degree and a Master of Architecture and am licensed in Texas #5862 and the NCARB 21,115 and in addition am a licensed Hospital Administrator because the design field of "HEALTHCARE" is my specialty. Granted there may be some in VISUALIZATION that choose to be in Performing Arts - and if so, let them choose that as a focus as they started thinking they wanted to be Architects in the beginning.

---

Do not agree with Construction Science move from COA to Engineering. I was a BC graduate in 1985. Benefitted from engineering content. Much greater benefit from other aspects of the COA. Could expand CE within engineering to target broader needed education. Would not have been beneficial to me then or now. Don't agree with moving any other academic disciplines, sciences, etc... to liberal arts.

---

I believe it would be a huge mistake to move the Construction Science program from the College of Architecture to the College of Engineering! Construction Science aligns more with the COA and NOT the COE. I began my degree in Mechanical Engineering and made the transition to Construction Science in my 2nd year. I made this move for a reason! Construction Science belongs in the College of Architecture. I can't even imagine the reasoning to think it should be in the College of Engineering.

---

I am concerned about proposed changes to the College of Architecture. I understand and agree with the Visualization Department moving out of the COA. They are no longer focused on generating architectural modeling as they were originally intended. However, I do not believe that Construction Science should move out to Engineering. Architects and Landscape Architects should work with COSC to ensure all students have interdisciplinary knowledge of how these designs and components work together. This was one of the true benefits of the COA. I think moving COSC could create negative outcomes.

---

I feel that the college of architect really benefited from have COSI and VIZ in the college. As a graduate from LAUP, I enjoyed learning from the cosi and viz students (my roommate was viz and I learned so much from her!) the cross collaboration between departments is important. I've seen just how important that is now that I work professionally. I don't think realigning the college of architecture is going to have the desired affect. I would recommend reconsidering it .

---

It is my position as a former student of both the LAUP and MUP programs within COA, that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any

recommendation.

---

While I have no real opinion on the relocation of the Visualization (VIZA) program, I believe it would be a disservice to the College of Architecture to relocate Construction Science to the Engineering school. The line item "refocusing the COA solely on the core mission of architecture.." should also include Construction Science. In the practicing world, the two work closely together, so why would it make sense for them not to in the educational realm? Personally, I think I would've benefitted greatly from required COSC electives as an ENDS student. Back then of course, I wasn't really thinking about my career path and licensure as much as I was just trying to graduate. I have spent my last six years working as a project manager for different commercial and restaurant clients, where a big learning curve was understanding the best ways to build things and designing with how it should be built in mind to best achieve design goals. I would love to see the COA create more collaboration between the ENDS and COSC programs, instead of splitting them even further.

---

The Department of Construction Science must remain in the COA for the benefit of the education of architects. As a Principal Architect and Structural Engineer I see far too many mistakes made by architects with too little understanding of the construction sciences. Shifting the department to engineering risks a loss of focus in that department on buildings to the greater volume of non-building work. My degrees in Bldg. Const. and Env. Des. served me well and propelled me to Masters in both CE and Architecture at MIT and membership in Sigma XI, the Scientific Research Honor Society. Teach more building sciences to architects, please!

---

The Construction Science degree program should continue in the College of Architecture and not move to the Engineering College. Construction is integral to Architecture.

---

I applaud the recommendation to develop a formal College of Fine Arts at TAMU. I disagree with it being part of a new Arts and Science College that facilitates STEAM by integrating arts with a technical education. I believe that Fine Arts should be part of a College of Architecture and Fine Arts. I also believe that Visualization should stay with Architecture. I am neutral on seeing Construction Science move to Engineering, but also feel that Construction Sciences courses should be require of Environmental Design and Architecture students. If separation of Construction Science from Architecture weakens existing educational links, it will be a disservice to the students' education. I believe that a STEAM college would be too large and clunky to manage. There will be excess politics around governance of resources and educational emphases. A Dean of such a diverse and large educational function would likely either have pre-existing biases, or need to develop biases to avoid being eaten alive by the politics. The school of Architecture is a relatively small unit, and very well suited through its integration of arts into it Environmental Design program, to integrate with a School of Fine Arts. Emphasis on arts within a singular STEM program can be accomplished through required courses and collaboration between colleges. Collaborations are better achieved by senior leadership than through risky realignments.

---

As a graduate of the Construction Science program I have concern about moving the program to the College of Engineering. The College of Engineering is focused on the "design" of structures. The graduates of these programs offer their talent to the world by creating the blueprint for how structures are built. The Construction Science students take this blueprint and construct it. Although these processes transition from one to the next; the type of mindset to create each is vastly different. My concern is too much of the theoretical math from the College of Engineering will intrude and limit the ability to teach the process of what it takes to actually build these structures. As a first generation college student I went to Texas A&M as a Civil Engineering major. I never really found my path. Civil Engineering was the closest thing I knew of to what I wanted to pursue as a career. Once I heard of Construction Science it was like a whole new door opened that allowed me to flourish. My grades went through the roof, my career has been amazing and I owe it all to my time in the Construction Science department. My oldest son is set to graduate in May of 2022 in Construction Science. Please continue to let the program evolve and grow but do not change it from it's core principle of focusing on the management process of construction [REDACTED]

---

I don't believe the Visualization program should be moved out of the College of Architecture. Visualization has more in common with Architecture than a new School of Visual and Performing Arts. Visualization is not a Liberal Arts program.

---

Rationale for combining Arts and Sciences is not apparent to me. In my mind these disciplines are not sufficiently aligned as to put into the same college. Why should there be a goal to make any college larger? Just because some peer institutions have this combination does not justify doing the same for TAMU. Certainly it does seem logical to put Geosciences into the College of Science. STEAM-focused university is a smart expansion of our historic STEM mission. As the Visualization Department has evolved, its focus seems to have drifted away from urban design and buildings to serving film, gaming and commercial organizations. Although it now seems logical to put the program under Arts, a

strong market remains for enhancing architectural, landscape and urban images. Collaboration and shared learning with College of Architecture programs should be promoted. Construction Science has become a powerhouse within the College of Architecture, although it is valid to observe it is out of focus with the primary COA mission. Still there have been, at least in the past, enrichments for both design and building oriented students to share classes, project collaborations and friendships. Not only does the TAMU land-grant purpose gain from such collaborative works, these folks often spend careers respectfully working together. Would it further diminish the COA campus influence to make COE even larger as COA shrinks? Please don't let that happen.

---

Combining the Colleges of Liberal Arts, Science, and Geosciences into one could cause friction among faculty as well as students as social attitudes and learning objectives can vary widely among this group. Greater diversity of thought and individual freedom can be maintained by keeping them separate lest one group tend to override the view points and priorities of one with less influence. In considering the addition of new degree programs consideration should be given to distinguishing these programs by emphasis and course requirements from those already available at other Texas institutions, not just duplicate what is already out there. Also, these programs must evaluate the employment potential for students completing these programs to ensure that their time and money devoted to an education is rewarded.

---

#### Good plan

Construction Science Department is the crown jewel because: Faculty—real world field experience CIAC—provides huge resources, scholarships, teaching, industry updates, internships, etc. Curriculum—aligns with Architecture and blends some engineering. As an employer of Construction Science grads, our Company has no interest in hiring Engineers. We are opposed to aligning the Construction Science Department with Engineering.

---

The Journalism degree should be kept under the department of communications as the two disciplines provide complimentary instruction for students wishing to pursue promising careers in media, advocacy, public service, and corporate affairs. I fear the lack of a focused journalism degree will diminish opportunities for students wishing to pursue such a major at TAMU and look to other schools such as UT or UH that have dedicated journalism programs. I minored in journalism and went on to attend the Bush School where I graduated in June of this year. I find my journalism background very helpful in my career as a Public Policy consultant where I worked with tech firms such as Salesforce, AWS, and AT&T to build out their government affairs framework. The practitioners, professors, and administration within the communications department are well-versed in curriculum related to media, communications, and journalism and, I believe, the best to be teaching the subject at this university. Please keep the journalism degree under the department of communications so students can receive the top-tier instruction needed to pursue the career of their dreams.

---

Centralizing departments and colleges into four colleges only is an idea only the four colleges who stay in existence could like. Having the Mays Business School, our internationally recognized Vet programs, and others lumped in and lose their identities is a heartbreaking thought.

---

**DO NOT IMPLEMENT #9C recommendation to move "Construction Science" to Engineering because it's an obvious NON SEQUITUR!** The lead-in sentence is "The Department of Construction Science is nationally recognized as a top program by the construction industry". This is looking for a "solution" where there is NO PROBLEM! My concerns follow below: 1. Future Acquisition of Talent – The Construction Science Program currently caters heavily to the building construction industry ("vertical construction" for purposes of my email). In fact, in the period report by the department, over 85% of the students went to work for building construction related firms in the commercial (63%) and residential (23%) industries. If the department were moved to the College of Engineering, the building construction industry would be "competing" with a much larger variety of industries. This could place our industry in a challenging recruiting position at a time when our workforce is already diminished and strained. 2. Academic Emphasis – At other universities where their construction management program is housed in engineering colleges, the curriculum is vastly different than that of what our program possesses today. Much of the curriculum in engineering colleges lacks key elements that have been developed in Texas A&M's current curriculum specifically for the commercial and residential building construction industry. 3. Interdisciplinary Collaboration with Architects – In the commercial building construction industry, architects are the primary hub for the design team. Moving our students out of the College of Architecture would distance them from students in architecture creating an inconsistent environment than what exists in our industry. This collaboration is already challenging to implement in the higher education model and would be worsened if this move were implemented.

It is my position as a former student that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation. Thanks & Gig'em

---

I am concerned about the proposal to combine the Colleges of Geoscience, Science, and Liberal Arts into a single college. The College of Geosciences is a relatively small college; being combined with two other large colleges into a single, extremely large college means that the geosciences will lose their already small voice at the university. Although TAMU has a longstanding relationship with the now-declining petroleum industry, this time of transition to renewable fuels means the geosciences are more important than ever. I understand the desire to reduce administration costs, so while I hate for the College of Geosciences to go away, I would support combining the geosciences with the College of Science and leaving the College of Science separate from the College of Liberal Arts. I also fear that combining all three colleges into one giant college will reduce the amount of discipline-specific support available to students. That includes support like academic advisors, tutoring, and the like. You don't want academic advisors to have to serve students with such a broad range of majors -- as an academic advisor myself, I assure you that the broader the range of students you serve, the less specifically and accurately you can serve each one.

---

Support the idea of the combined Colleges of Arts and Sciences. I like the ideas expressed on Bush School and Library Sciences.

---

I am a former student of architecture, and reading over the academic realignment, I think there is an issue in terms of the distribution of the Architecture and arts programs that is suggested in these reports. As for the move of construction science to other colleges, I totally agree, as their curriculum and focus is not at all the design conversation which most of the programs in the architecture college are. The issue with the distribution of arts and vizualization to another program is that a lot of the skills (especially the computer animation and rendering / 3d modeling) are transferrable to architecture in a host of ways, and these skills add to architecture students tremendously, helping them produce even better work which can be used to advertise the school. Another quick idea is that the College of Architecture should be refocused to become the college of design, and more programs here should be implemented and a new system for major selection should come forward to help students succeed both academically and personally (Need UX/UI Design, Product Design, Interior Design, . The department of architecture also has some issues specifically related to top down issues which prevent its growth, namely in budget for research applications and software which is critical to the progression of the school in its relevance within the field today. Another aspect is that there is a group of professors who consistently send students from this program to ivy league schools, including Yale, Harvard, Princeton and Columbia, just to name a few, and there's no reason that these individuals wouldn't push the college past its current rank besides that the current research applications of architecture are not received well by many of the long time faculty of the college. Another thing is that the department of architecture students are not supported with the software they need to learn to be relevant in the program or the real world. (Rhino 3D, 3DS Max, Revit, Keyshot 10, Redshift, V-Ray). Another thing is that the students of Architecture do not have proper labs (speaking of robots and advanced 3D printing labs) and have to borrow other campus' resources to do relevant research. Students also do not have access to a wide variety of experts to get assistance from to further their understanding and interests. Design fields usually revolve around getting input and knowledge from other disciplines to produce new ideas and understandings. These are some of the many issues these students and this excellent faculty faces. There needs to be a serious realignment in this college around the professors who send students to these ivy league schools so that the University can learn to retain the students they have and improve its standing and academic excellence.

---

Same as above.

---

November 2, 2021 Dear President Banks, In the fall of 2003, former Texas A&M University President Dr. Robert Gates announced that my class would be the last to earn journalism degrees, and that the Journalism Department would be shut down. I was devastated and decided – being the precocious freshman journalism major that I was – that I would write a letter voicing my displeasure to Dr. Gates. I emailed him but didn't hear back. Then I decided to print out my letter and stick it on the steering wheel of the golf cart he often rode around campus for meetings, that was parked near one of my classes. He emailed me back within days. I didn't have the foresight to save his email, but essentially he assured me

that he supported journalism studies and that he felt the best path was to study something other than journalism and learn about reporting through internships and classes. I write to you now, nearly 20 years later, as a graduate of Texas A&M's Class of 2007, and former [REDACTED] of The Battalion. And, yes, I have decided to use the process for submitting feedback instead of trying to find out if you, too, have a golf cart where I could leave a letter. I am now a reporter at CNN based in New York City, where I have been working for the past seven years. I report live on our television channels as well as write pieces for CNN.com. My work is shared and broadcast around the world and I can genuinely say that I would not be where I am today without my experiences learning about journalism at Texas A&M, both in the classroom and at The Battalion. I have a great deal of respect for Dr. Gates, but even now, decades later, I disagree with his argument. Yes, you can and certainly should learn journalism by practicing it in internships and summer jobs and at The Battalion. But you must learn about it in the classroom as well. A rigorous journalism education that teaches standards, how to vet sources, journalism law and ethics is what separates journalists from any private citizen who shoots their own stories or writes pieces they self-publish on blogs or websites. In this age of digital journalism, where even an intern's pieces live forever in links online, it behooves Texas A&M – and quite frankly schools everywhere – to teach students the basics of journalism with the guidance of an experienced professional before they publish. Not to mention the disadvantage that several years of aspiring Aggie journalists who came after me have had in obtaining internships and jobs. Many media outlets will not even look at your application if you do not have a journalism degree. And many internships won't either. Both are setbacks that are difficult for aspiring Aggie journalists to overcome in an already competitive field. I support Dr. Blanton's proposal to direct resources to journalism through a rebranded Department of Communication and Journalism, with the long-term goal of founding a Texas A&M School of Communication that would house a future Department of Journalism. I would be thrilled to lend my support to this school in any way I can – financially, as a guest lecturer or in some other way. The journalism curriculum, coupled with real world experiences at The Battalion, will ensure that any student who wishes to explore a possible career in journalism or communications can get the experience they need to make them competitive once they graduate. I also whole heartedly believe that offering these pathways for future students makes Texas A&M more attractive to students across the state and the nation. Most of all, I feel it's important to offer strong options for journalism and communications studies at Texas A&M because of its rare and diverse body of students. Our school, made up of students from big cities, small towns, who grew up on farms or from different countries, who spend their time in the Corps of Cadets or in one of the many unique student groups we have to offer, are what make this school unlike any other school I've come across in my reporting career. I think it is critical that the unique voices A&M houses and nurtures are represented in media companies across the world, and in order to foster the future generations of Aggie journalists and communication professionals alike, we need to be able to offer them a strong foundation in journalism and communications education. Best, [REDACTED]

Aggie COSC Class of 1994 - I strongly disagree with Recommendation #9c - specifically the recommendation that the Department of Construction Science be moved to join the College of Engineering. For over 20 years, I have utilized my COSC education in my career in investment real estate and construction. My personal path has led me to highly value the exposure I had to architectural and design related coursework and I feel those experiences led to a very well rounded understanding of what I needed to know in my industry. I understand the desire to have COSC students be exposed to engineering related coursework as a part of that well rounded curriculum. However, placing the Department of Construction Science within the College of Engineering will have too heavy an influence on the direction of the COSC coursework. Engineers have their place in the industry - however, the "connections" to Civil, Mechanical and other engineering disciplines (as stated in the report) should remain just that. COSC students should have a peripheral knowledge of how to incorporate engineering disciplines into the success of their projects, but still remain at arms length so they can successfully coordinate ALL trades and disciplines. COSC students need to be exposed to more hands on experiences in the field and more focused on efficiently managing projects from conception to reality. COSC students fill a specific occupational niche in the construction industry that no other program can prepare them for. There is a reason that the Department of Construction Science is nationally recognized. Thank you for your consideration, [REDACTED]

I feel any school associated with the College Station campus should follow the same levels of academic standards if the are to carry the Texas A&M name.

I was a student of both the Landscape Architecture and Visualization programs at TAMU, and have worked professionally as a successful architectural illustrator for the last 11 years. I think it is a mistake to separate the VIZ and Architecture schools. Attending studios in close proximity to one another was paramount to my education, and

eventually, professional success. I gained a technical understanding of the built world, the importance of water, ecological systems, and how people interact with the world. In the VIZ program I was introduced to new techniques and methods for sharing this technical knowledge with others. Architecture and Urban Planning deal with guiding and reshaping the existing physical world, but without visualization these ideas cannot be fully expressed. If anything I think that these programs should work even closer together. They should share the same projects even, as opposed to separating them into separate buildings on campus. This would strengthen students' portfolios from both programs, while also giving them an understanding of how things work from both ends. All too often professionals end up working inside of a vacuum, which wastes a lot of time and energy (even architects and landscape architects barely agree on anything). If people understood each other's workflows from a younger age, how much more efficient could future generations be?

---

As an Outstanding Graduate of the College of Architecture - I strongly object to the rationale of removing the visualization from the College of Architecture. What a simply horrible idea!

---

The comments are directed at Recommendation #9c: Refocus the College of Architecture on the Core Mission (pg. 37-38) Background of Respondent: Construction Executive with 40 years of experience in a Senior Executive position with the Clark Construction Group. The recommendation to realign the Department of Construction Science (COSC) and Visualization (VIZA) is not appropriate and impacts the total educational experience of future graduates from the College of Architecture. One, the integration of students studying the design discipline with students studying construction and visualization, is unique to the industry. The strength of the COA current Department cross-section in these studies is one reason the COA is respected and highly rated. Two, the basic interface of highly motivated "creators" of design (COA) in parallel with technical "realists" of delivery and build (COSC), is a strength that should not be separated. Three, Visualization has evolved to link design with build. The ability to visualize design with realistic images, planning of delivery in three dimensions, and prevention of interference or "clash prevention" between design elements, is an industry requirement. The Departments compliment each focus of study and the students need and require the understanding of all three departments if they are to excel in the Industry. Separating these disciplines of study weakens the understanding of future graduates. A reflection on the past... when the College of Architecture initiated and established a study program in Construction, 50 plus years ago (ARCO), I was one of the students who transferred from Civil Engineering to the College of Architecture to focus on the construction or build side of the industry. I never looked back...

---

Why? No other reason is given other than "other schools do it". Well TAMU is not just "another school". I really don't care what the University of Michigan is doing. No to Finding #1 - Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. No to Finding #3 - no other reason than it's a small number and Texas does it? Seriously? Again, maybe people don't need or want to come to TAMU for those degrees. NO - Recommendation #3: Establish a Department of Journalism.

---

Finding #4 Texas A&M University Purpose Statement: To develop leaders of character dedicated to serving the greater good. The character Texas A&M University seeks to develop can be defined by the University Core Values of Excellence, Integrity, Leadership, Loyalty, Respect, and Selfless Service. The Texas A&M University administration and faculty have a crucial role in developing leaders who will change the world for the better. Administration and faculty members have a unique opportunity to influence and shape the virtues and values of their students, the community, and the world. Select Texas A&M schools and or administrators are exceptional at developing leaders of character dedicated to serving the greater good. These elites can be analogized as Army Rangers, Navy Seals, or Air Force Pararescue. The culture these select units possess would be diluted beyond effectiveness if the entire Army, Navy, or Air Force declared all their personnel to be part of these highly effective units. Exploding expansion of these schools, for example, The Bush School of Government and Public Service, should only be attempted by giving the leadership of these outstanding schools the tools and time to retain and acquire administration and faculty that inspire students to embrace the elite school's culture.

---

Once again, the authors of this report clearly display their ignorance in terms of Texas A&M's unique areas of focus and the key to many facets of our success: their drive to make A&M more similar to "peer institutions" is not one which I (nor a very large portion of the Former Student body) would support. We do not want A&M to be more similar to the University of Michigan, Florida, or Rutgers. Texas A&M's outsized contributions to the world of STEM education are part of what makes us stand apart from those (and other) institutions. To water that down by adding Art as a focus and performing a clunky rebranding to "STEAM" education would be to subvert the programs that make us stand out. Let me make my opinion (and that of countless other Former Students) crystal clear: art is not a core competency of Texas

A&M, nor should it be. There are strong arguments for building and strengthening particular study, areas such as those within the Department of Visualization, but that is an exception (one which, I point out, also focuses heavily on STEM subjects as a base of knowledge). I could be convinced to see the need for bulking up programs such as Journalism, but a proper argument as to Texas A&M's particular advantage in further developing such a program should be made in a separate report, not rolled into one such as this with extremely wide-ranging findings and recommendations. As relates to the recommendation to "Elevate and expand the Bush School of Government and Public Service," I whole-heartedly agree with this recommendation and would support its enactment. As to the recommendation to "Create the new Institute of Biological Life Sciences," I would caution that this should be investigated much more thoroughly before taking this on. While there are some good arguments made for doing so, more evaluation and appropriate rationale should be provided on this point. As relates to recommendation 9b to "Refocus the College of Veterinary Medicine on the core mission of graduate education and invest in the construction of a new Small Animal Hospital," I whole-heartedly agree with this recommendation and would support its enactment. To provide full transparency on this particular recommendation input, I am a 2012 graduate of the College of Veterinary Medicine.

---

No, I do not believe this realignment to be in the best interest of the College of Architecture or it's students.

---

I am very supportive of the proposed shuffling and/or merging of departments into the differing schools. Each action should be managed as a project. Staff and students should be engaged as Project Management Teams in the creation and implementation of each plan to create enrollment in the process.

---

The proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

To NOT move the Construction Science Department to the College of Engineering and to NOT move Visualization to the College of Fine Arts. This decreases the value of each degree having a wholistic approach to engineering and design-related principles.

---

It is my positioning, as a practicing Landscape Architect, that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

As a part owner of a commercial construction firm employing many Former Students over the decades and currently today, I do not support the recommendation to move the Construction Science program to the College of Engineering. This will harm the construction industry, already struggling to find talent to build the facilities found in all cities (including the Texas A&M campus) by shifting the recruiting focus away from construction. It will also eliminate key portions of the curriculum for this program that are aimed at allowing graduates to succeed in the field immediately upon entering the workforce. I strongly hope this recommendation will not be implemented as it stands to do harm to the entire construction industry as well as students with career aspirations aimed at construction. Thank you.

---

As a former student, it saddens me to see that the College of Architecture has taken the decision to separate the Visualization and Construction Science departments. Architecture, Landscape Architecture, Urban Planning, Construction Science and Visualization go hand in hand with each other in the real world. As a professional, I can say that they are vital with one another. It is important that students are able to collaborate or intercommunicate between departments. Please take the time to reconsider this grave decision.

---

I vote to NOT move the Construction Science Department to the College of Engineering and to NOT move Visualization to the College of Fine Arts.

---

I am a former construction science graduate (C/O '18) and I do not support the proposed change to move the COSC program to the College of Engineering. The COSC program is one of (if not the) best in the nation. The school curriculum has been developed and refined over many years with the help of the Construction Industry Advisory Council. Switching colleges will have an impact on the classes and curriculum required to graduate with a COSC degree. Our classes are one of the things that make TAMU COSC stand out taller than the other colleges with similar programs. As someone working

in the field, I talk daily with the architects to ensure we are implementing what the design is. Being in the College of Architecture lets us get an early start on this critical collaboration between the builder and designer.

Disagree with proposal regarding College of Liberal Arts. Little was reported about our famous business (Mays) unit? Does a huge Art unit fit a Land Grant institution?

As a former student of the College of Architecture who graduated with a BLA and minor in New Media Art, my curriculum was very intertwined with the Department of Visualization. The relationship between these departments is what teaches students the importance of visual storytelling and design communication. The same interdependency between departments can be seen with architecture disciplines and construction science. In the real world, the AEC industry (literally Architecture, Construction, Engineering) depends upon the communication and understanding between disciplines. Architecture without an understanding of construction results in a discipline not rooted in reality. Vice versa, construction and engineering lack form or imagination. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture, Landscape Architecture, Urban Planning, and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper connection be sought out by the University and it's consultants before moving on any recommendation.

As a 1967 Agriculture Journalism graduate of Texas A&M, I find the recommendation to establish a school of journalism interesting. My degree curriculum was actually a double major in journalism and agriculture education. I was sad when the journalism department was closed several years ago. It is my hope that if a new journalism department is implemented, that past mistakes (emphasis, curriculum, funding and support) are not repeated. Also, it is important that any new journalism initiative addresses the changing information dissemination and reception processes. We do not need to be turning out students whose skills are outdated. IT IS VERY IMPORTANT that the current agriculture communications and Journalism program is maintained and supported. I find it interesting that it was not addressed in the study and analysis.

Regarding the COA, the departments and dean have expressed that they do not want academic realignment. This should be seriously considered. The programs offered currently do not fit perfectly under one mission but the diversity in education that a student in the COA can have (with the joint programs offered) provides for a well-rounded student. From the perspective of someone outside the administrative field, realignment makes sense. Those with administrative power disagree and their reasoning should be heard and considered carefully.

Please DO NOT move the Construction Science Department to the College of Engineering and DO NOT move Visualization to the College of Fine Arts.

As a former student of Landscape Architecture, sister to a brother who studied Construction Science, and a friend to many Urban Planning, Architecture, and Visualization students, I adamantly OPPOSE the breaking up of the College of Architecture into new departments. The synergies between all of these departments have given me a unique position in my workplace that other graduates from other universities do not have. The cross pollination of Science, the Built Environment, Art, and Landscape are not only required for a robust knowledge in each discipline, but need to be ENHANCED within the College of Architecture. Visualization students need to depict convincing and engaging landscape and architecture as new and exciting environments are explored through creative mediums. Landscape Architecture and Architecture students need the creative energy that Visualization classes provide. Firm knowledge in Construction Science allows designers to create more functional spaces, while close proximity design informs construction students of how the impact of what they are building transcends safety, health, and welfare. As a Landscape Architect, I work with Architects, Planners, Contractors, Artists, and Developers in my everyday work. To remove one from the College of Architecture would provide a weakening of program knowledge across the board, and would not adequately prepare students for the real world. Such a suggestion demonstrates that the University is entirely out of touch with the work that this College demonstrates and the high caliber of performance that these students perform. As a student, the most influential classes I had were classes unrelated to my major as they strengthened my understanding of the breadth of the built, natural, virtual, and cultural environments. Not only would it be horribly inefficient for all of these departments to duplicate their courses, but silo others within funding efforts.

Please do NOT move the Construction Science Department to the College of Engineering and do NOT move Visualization to the College of Fine Arts.

As a Former Student and having received a bachelor of science degree in political science, I agree with the rationale #4 to merge, to some degree, the Bush School and Department of Political Science. I feel that my education would have

been enhanced in this field and the expertise of Bush School faculty should not be reserved only for graduate-level students. Alternatively, while my professional career after college began in public service, I have used that experience to advocate for the commercial construction industry as a full-time staff member of the Associated General Contractors of America, Houston Chapter. While not a construction science major myself, I have come to fully understand the quality of the graduates from the COSI program under the College of Architecture and their impact on the construction industry. While examining Finding #9, I feel it is not in the best interest of the students or the State of Texas to adopt Recommendation #9c and “relocate the Department of Construction Science to the College of Engineering”. Initially, my degree program prior to arriving on campus was in the College of Engineering, but upon learning of the college-specific admissions process, I feared I would not be able to study the major I wanted. This is why I made 180 degree move to studying political science prior to beginning my first semester. I had several friends go through the College of Engineering and either were placed in a non-desirable major or went a completely different route, setting them back in their studies. I fear students who want to study construction science may not have the chance if moved under the College of Engineering, thus creating more of a strain on the workforce in our industry among professionals. As a matter of the way the construction process works in practice, the collaboration with architects is crucial. In a time where this collaboration is evolving with new technologies and refined delivery methods, it would be a disservice to the students entering the industry to distance the two. Looking again at Finding #9 and Recommendation #9c, it seems that while TAMU currently has a leading construction science program (fact), this relocation is based on “lower state funding and competition between academic units” while offering the College of Architecture an opportunity to refocus its mission to increase its “national rankings and reputation”. I believe there are ways to achieve the desired outcomes while keeping the Department of Construction Science under the College of Architecture, which ultimately benefits the students’ education.

---

The proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

All the recommendations should be implemented

---

Agree with a caveat: Focus on the Land-Grant purpose of TAMU. We do not need to be, nor want to be known as a Liberal Arts university. We do not need to compete with most other universities. We have our own character which is based on STEM education. However, small art-based departments contribute positively to academic diversity which is good. The Science portion of the college should be dominant. Recommendation 9c: Removing construction science will greatly diminish the college population. More recruitment for Landscape Architecture is needed.

---

As a former student of the Construction Science Program at TAMU, I disagree with the reports recommendation to move the Construction Science Department into the College of Engineering. My greatest concern is with the curriculum that could be changed due to the colleges requirements. I have many colleagues from other Universities where their Construction Science Department equivalents are integrated with their Colleges of Engineering, and they have many classes that aren't beneficial to their current role in the Construction industry. Unfortunately, those engineering-gearred classes then take the place of more industry prudent courses that are offered at TAMU. Those Universities lack many of the key elements that sets the TAMU Construction Science Program apart. I'm also concerned that the College of Engineering would require the Construction Science Students to go through the same ETAM process as engineering students which could negatively impact the program. Another concern I have with making this change is the acquisition of talent. As noted in the report, the TAMU Construction Science Program is the top in the nation. I'm concerned that if the department were moved to the College of Engineering, the building construction industry would be “competing” with a much larger variety of unrelated industries for hiring future graduates. This could place our industry in a challenging recruiting position at a time when our workforce is already diminished and strained. This could also place the students in a much more competitive environment where they would not only have to compete with other COSCI students, but also those from the Department of Engineering. Lastly, in our industry, the Architect is typically the main point of contact for the design team. If this change is made, it will distance the students from their future design partners which would then create an unrealistic image of what they should expect to encounter when they enter the industry. I think rather than relocating the Department of Construction Science from Architecture to Engineering and

impose negative effects on the building construction industry, perhaps there should be more development of the existing program in the College of Engineering

As a former

I share in their concern that the proposed Academic Realignment recommendations for program realignment within the College would weaken the College rather than strengthen it. The departments of Construction Science and Visualization are integral with the programs and professions of Architecture and Landscape Architecture, Urban Planning and have any movement of these two programs will have a detrimental effect on the entire College. It is readily apparent to me that the synergy and support that each department gives the other is not at all understood by the outside consultants who authored this study. I strongly urge that these particular academic realignments be taken under advisement and given much deeper scrutiny before any decision is made to move them out of the College of Architecture. While the rationale for moving these programs might appear to have merit on the surface, any realignment should not damage or cripple the host College from which these programs were conceived and flourished.

As a manager in the building construction industry, I have deep concerns with the recommendation to relocate the Dept of Construction Science into the College of Engineering at TAMU. Based on my experience with recruiting students from construction management programs that are housed within the college of engineering at other universities, I have learned that the curriculum at those other universities is vastly different (to that at TAMU) and less relevant to the building construction industry. Those students are less prepared for the workforce when compared to their TAMU peers. Additional concerns involve the potential of higher admission requirements that could reduce TAMU's construction science enrollment, and limited involvement from industry partners (Construction Industry Advisory Council) on curriculum that may be imposed by the college of engineering, which would negatively impact TAMU's construction science program that is widely regarded as the best in the country. I do not support relocating the Dept of Construction Science into the College of Engineering.

My submission is in regards to the proposal to remove the VIS and Construction Science programs from the College of Architecture. I believe this would be a mistake and do a disservice to the students in all of the CoA. I have been working as a Landscape Architect for ten years, and the overlap between architects, General Contractors, and 3D graphics is huge. We consistently use 3D programs to model design, and this trend will only increase as our design world moves more and more towards CI processes. The Construction Science students benefit from the overlap in design process and consideration, as well, and it creates professionals who are more open minded to the overall performance and enjoyment of a built design, rather than simply meeting budgets. I do not support the consideration to remove these two related fields from the College of Architecture.

Over rationalization of academe is counter to the pressing need for academic focus on interdisciplinarity and collaboration in a dangerously complex, hyper-interconnected socio-political-ecological environment. To provide academic units with the freedom to experiment with interrelationships among disciplines requires the administration to provide the physical and financial support for expanded not restricted exploratory interactions.

It is our position as Former Students of the Landscape Architecture program is that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning, and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on to any recommendation.

Structuring the construction science program under the engineering department will deprive students of so much exposure that is offered in working with the architectural program. The vast majority of graduated pursue careers in vertical construction which deal primarily with architects and a different variety of challenges than the engineering focused heavy/civil construction market deals with. I for one, pursued the heavy civil career path early on in college but found vertical construction to be more rewarding through my college experience, particularly through capstone and guest lectures hosted by and dealing with designers. These experiences helped me understand the different perspectives, challenges and rewards of vertical construction that based on my experience and internship, the heavy civil world didn't have to offer. In retrospective, I am very grateful that so many industry leaders take their time to impact the construction and architectural program in a way to foster designers and builders to work together in, in my opinion, the most challenging type of construction. This impact shifted my career path for the better and I hope that Texas A&M hears this message that there is a large market depending on educated and driven architects and

constructors coming from A&M that have an understanding and appreciation for each other's challenges with a common interest in building something great.

The Department of Construction Science needs to stay within the College of Architecture. The program has risen to prominence in the industry because of the tailored curriculum and the association with Architecture. Its students predominantly enter the vertical construction industry where architects are their peers in the typical team dynamic of Owner, Architect, Contractor. The interactions with future architects and the blending of curriculum is the key to the Department's success in delivering leaders to the construction industry. This same dynamic would not exist in the College of Engineering and most engineers, in the vertical construction industry, are sub-consultants to the Architect and are not direct peers of the Contractor. While the recommendation could make sense from a purely organizational standpoint, the people making the recommendation lack the understanding of the importance of the associations and why those associations were created in the first place. To make the change would fly in the face of what has made the Department the leader in its industry.

As a recent graduate and young professional, it is my opinion that the proposed Academic Realignment would weaken the College of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. The connections and inspiration students working in the same space gain from each other is paramount to a well rounded education in these fields. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

I would love to see the Money Education Center fall under Student Affairs. It is an incredibly important program that I think would benefit from being under Student Affairs.

I do not agree with the proposed action to realign the Construction Science department in to the College of Engineering. The College of Architecture has long been a logical fit. Most graduates will make careers in vertical construction trades with responsibilities of managing the construction process, a vastly different discipline than that of engineering. In vertical construction, the contractor's coordination is primarily with the architect. Engineers, on the other hand, are consultants that work for the architect. For this reason, I feel that the interplay between contractor and architect is more important than the interplay between contractor and engineer. Of course, though a minority, there are construction disciplines that work directly with engineers, and maybe those would be best suited under the current construction coursework currently offered in the engineering college. The Construction Science at Texas A&M University is widely regarded as the preeminent program in the country, and realignment could act to restructure the key elements of the degree that have catapulted it to a standing that is second to none in the industry. I strongly urge to reject realignment of the Construction Science department.

I agree with combining the College of Liberal Arts and College of Science, on the condition that one college does not over dominate the other. I agree with Recommendation 2 as well. I think this is a great idea however, I do not believe the university is a visual arts school (other than the dept of vis.). Not every university needs to offer every major available. I disagree with finding number 4. We need to stop expanding. You don't see luxury car brands making more vehicles to increase ownership? No, why? It lowers the value. Stop lowering the value of programs! Recommendation #6: as an archivist, I think this is a great idea. If anything, allow courses pertaining to Library studies and offer them as electives for history or political science majors. My background is in History from A&M and I am an archivist for the USAF. The only issue I have is A&M is known for being an engineering and business school. Will this remove resources from our top programs, watering them down? I have no input for the other recommendations

If this would allow you to address departments that are off doing their own thing, that would be a good thing.

I disagree with the report's contention that there is something wrong with a STEM-focused university under-representing arts, humanities, and social sciences. On the contrary, resources at a STEM-focused university like Texas

A&M should be reserved to a large great extent for engineering and science programs, to a lesser extent for the arts and humanities, and to hardly any extent at all for the social sciences.

In reviewing the section on Academic Realignment, I can say that developing a department of journalism is definitely not in the best interest of TAMU. The media in this country has lost their souls to the almighty dollar. Look at the garbage that the Battalion churns out day after day, week after week. The Battalion HATES this university and preaches hate non-stop and yet the university supports them in the name of free speech. Is there ever a 'other side' published? I think not. A department of journalism would invite more progressive, hateful people who are never ever satisfied. This runs counter to the very heart of what being an Aggie is and our core values. Actually, I am not in favor of establishing a college of visual arts either. Look at the roots of the university. Most degrees are solid, STEM, Engineering, etc. Many of liberal arts majors are still working at McDonalds hoping for their big break. Sorry, not a fan. I like the idea of elevating and merging the Bush School with the department of Political Science. That seems like a good move. Also like the consolidation of the life science behind the Institute of Biological Life Sciences. It would seem there would be benefit to all of those by consolidating. Much of the consolidation recommendation make good sense. The key is to group them into departments that make sense for the purpose of better collaborations, better use of materials, and better student outcomes in the long run.

As a BIMS graduate I started off in the Dept of Biology and then transferred to BIMS. I agree with a general first year in Biology before specializing. I was preMed and found it strange to take vet/animal courses. I hope the Music/fine arts depts are expanded. I was in the Symphonic Band and was grateful for that. At first, I thought you had to be in the Corps to play in a band. Rudder auditorium could be expanded or a new performance hall built to expand offerings.

No change. A&M should not be like other universities

Recommendation 1: The rationale given doesn't work for me. Recommendation 2: What input did the College of Architecture provide? If they endorse the idea, then it is worth considering putting it and the other arts departments in the College of Liberal Arts. Recommendation 3: How is the need for the creation of a department determined? If there are no criteria for making such a determination, then develop it. If journalism, voice, or basket weaving meet the criteria, then create the department. Recommendation 4: This make since to me. Recommendation 5: This needs a serious cost analysis. Recommendation 6: See 3 above. Recommendation 7: This make since to me. Recommendation 8: This make since to me. Recommendation 9a: No, those closest to the area of study need to develop the degree plan. Recommendation 9b: If you want to build a small animal hospital then do it. You don't have to reorganize or refocus the vet school. Recommendation 9c & 9d: If the Colleges involved believe is this should be done, then do it. Don't we have a process for making these kind of decisions between colleges?

As an owner of a Commercial General Contracting company in the State of Texas I believe moving the Department of Construction Science as proposed in the MGT Consulting report dated 10/19/2021 (under recommendation #9c - Rationale #9c) from the College of Architecture to the College of Engineering would do a disservice to both the students and the commercial construction industry as the graduates of the program typically end up in the commercial construction industry which is more directly and integrally connected to the architect arena rather than the engineering arena. Most of the graduates are involved in vertical construction in which the architects are the dominate design entity. I believe a much more appropriate education and preparedness for these students can be derived as it currently is being provided in the College of Architecture.

I graduated from the College of Architecture with a Bachelors of Environmental Design degree. I read that you are considering realigning the College of Architecture. I believe that this is long overdue. While the Department of Visualization is a great source of pride for the College of Architecture, I agree that it should not be in that College. I felt that the College Architecture had lost its way when I was attending class in the 80's. Your ideas for realignment don't go far enough. In my opinion there is no purpose for a degree in Environmental Design. I believe that the purpose of receiving a degree is to further advance your abilities, knowledge and be able to enter the workforce with a basic starting skill set and allow you to build a career. The Environmental Design program is too watered down to be architecture and not broad enough for general design. The majority of other universities offer a 5 year Architecture Degree, a 1 year Masters and a 1 year Doctorate program. TAMU offers a 4 year Environmental Design Degree, 2 year Masters and a 1 year Doctorate program. The watered down 4 year program leaves students at a disadvantage compared to other universities for obvious reasons. I feel that a real 5 year Bachelors of Architecture with a path to becoming licensed and working for an architecture firm would be extremely beneficial to the College of Architecture, followed up with a more traditional 1 year Masters and 1 year Doctorate. The Environmental Design program should be

changed into a more general design degree focused on design concepts, flow of concept to product, computer modeling, computer design, marketing, business, 3D printing, etc. I was in my junior year when I realized that I wasn't being put in a position to become a licensed and practicing architect. When I inquired about the curriculum, the standard response was that you would focus on that when you're a junior and senior, but that wasn't really the case. The degree plan should also include some landscape and city planning classes. I believe that the College of Architecture has a rudderless dinghy among other universities. Texas A&M has always been known for their Veterinary, Engineering and Agricultural prowess. The medical Doctor program has expanded tremendously since my time and now with Mays Business School, it is a top program in the country. The addition of Visualization was a huge success, but really serves as a distraction for how lowly the Architecture program really is. Architects historically designed bridges, buildings, skyscrapers, urban design, cities and they hired the engineers, now they work for building construction companies and have little influence on the structural aspects, home design or urban planning. I would love to see a completely revamped Architecture program, one that lifted it up to compete with the rest of the world and set up students to be the successful Aggies that our other Colleges have become known for.

---

The proposals here intrigued me. I specifically like the idea of the realignments around strengthening liberal arts programs. Hopefully this will increase participation in these studies by students in STEM programs. As an engineering manager who retired five years ago, I can say that I would gladly have traded some of the academic technical training that recent graduates that I hired had received for increased: writing skills; speaking skills; and creative talents that so many seemed to be lacking. If they received the basic technical skills I could teach them the advance technical skills they needed. I also agree with elevating the Bush School of Government and Public Service. I have a nephew who graduated from A&M with a Political Science BS in the past four years. He repeatedly stated that the time he spent at the Bush center was much more impactful than any thing else he did in his academic studies.

---

Strongly disagree with the realignment of liberal arts and sciences and geosciences. Are we just trying to create a giant college here, why put them all together? As a former student in college of science (math) and faculty member of the math department at TAMU, I do not agree with the thinking here. If anything, combining the sciences would at least be sciences kept together (college of sciences with geosciences) but definitely NOT liberal arts in there with these disciplines. Just because other schools combine these does not mean A&M should follow suit. I feel it's a bad idea to group them all into the same college. "This advocacy is a value in recruiting faculty in the arts, humanities, and social sciences which are often underrepresented at STEM-focused universities" taken from the report means nothing. How does having liberal arts in the same college as sciences and geosciences entice faculty members from liberal arts? It makes zero sense. Again, just because many schools use this model does not mean we should follow suit. Keep the sciences together maybe. A meteorology degree (atmospheric sciences in college of geosciences) is more like an engineering degree with all of its math and science involved! I think many will be disappointed if this merger takes place and to me, it's not in the university's best interest. Why the need to create one giant college by combining the three? I don't see the advantage here at all and feel some administrative ideas like this exist only to give admins something to do.

---

Moving the Department of Construction Science to the College of Engineering is a poor decision and should not be considered. If the Department of Construction Science is to move out of the College of Architecture in order to improve the architecture departments, it should be moved to the Mays Business School as that would be more fitting than Engineering in terms of applicable curriculum. In my 8 years of commercial construction experience as a project manager for a large general contractor, I wish I had more knowledge of business related classes than engineering related classes.

---

As a former student that is currently employed in the construction industry, I do not agree that the Construction Science program should be moved to the College of Engineering. I am a Construction Superintendent employed by one of the largest General Contractors in the United States and have found my most important job skill is being able to communicate with Owners and Architects about what is constructible. Being part of the College of Architect gives Construction Science students the opportunity to interact with peers that will eventually be colleges and coworkers in the industry. Additionally, I have found the my colleges that attended school where the Construction Management program is part of the engineering school are lacking in this job skill.

---

As long as the larger Arts & Sciences is not unwieldy to manage, it does help us compete against peer institutions.

---

Leadership is most likely able to better choose, but I also prefer doing what is best for the school based on the university (faculty, students, etc) ; not what outside influences desire. Do we need all areas of study? What makes one area valid or invalid? We need to make our own way as what fits into the university and its path forward. There are other schools

that serve certain degree paths. Do we want to offer something just to do so?

RECOMMENDATION #9C RESPONSE: Having been one of the first students to have a double degree major in Environmental Design AND Building Construction Sciences and having worked in the real estate development field for over 30 years, I think it is a horrible idea to separate the two colleges of study in the College of Architecture for the benefit of national rankings in architecture. The two disciplines are so integral to each other and share so many similar and complementary skill sets that to separate them from each other is analogous to removing Ed Pychic from the educational curriculum - they go hand in glove! BC majors are not inherently "wired" like PE majors and don't want to "compete" at that level with future PE students. There are about 6-8 engineering classes in the BC program which makes no sense to move them to the engineering college. Part of your problem with the Architecture degree program is the 4 year undergraduate plus 2 years of graduate school may not necessarily align with other undergraduate design schools in the US. Concurrently, attracting major league architecture professors to Texas versus the east and west coast schools is going to take more money than TAMU is willing to spend since this area of study does not take precedence over the major colleges like Mays and the Engineer colleges. This is analogous to joining the SEC conference - more money yields more prominence in that arena and, maybe, more victories. I could go on for a while but, in the end, this will be a political decision and not one made from common sense as it relates to the construction/design industry. You

It appears a re-occurring theme is create new high salary positions - sort of a trend I have seen from elementary and high schools to colleges - make positions at enormous salaries for those who majored in Education but really don't have any real skills.

I disagree with the proposal to move the Construction Science department to the school of Engineering. Removing from the school of Architecture will eliminate the chances for future architects and contractors to collaborate and learn from each other. After being in the construction industry for a few years, I coordinate, work, and spend 95% of my time dealing with architects, rather than engineers. In addition, the requirements for getting into the school of engineering are more rigorous than the school of architecture. Many of the students who are in COSC may not be the best when it comes to test scores or memorizing lines to get through a test. However, when it comes to common sense and having an understanding of the bigger picture, how things come together, and leadership, the students in COSC are second to none. Moving the COSC program to the school of Engineering would reduce the amount of hard-working students that have made this program so great and successful over the years. You cannot teach hard-work, dedication, or perseverance. After all, many of the COSC students are 1st generation and TAMU would be making a big mistake if they lost these students due to stricter school of Engineering requirements. In addition, the curriculum and professors will most likely be affected. COSC students need a heavy dose of business classes in the curriculum and a hands on experience. This better prepares students for the industry, rather than classes crunching numbers or designing building systems. Changes in professors will alter the program as well. Part of what makes this program nationally recognized is the incredible relationships that the professors build with the students. The professors in COSC are second to none and know how to push students to achieve their greatest potential and provide school, life, and personal advice. As someone who attends the TAMU career fair every year, I have concerns that the students will not be as well prepared for the industry if this change is made. I would strongly suggest to keep the COSC department in the school of Architecture.

In regard to Recommendation #9c, I request that the University NOT move the Department of Construction Science from the College of Architecture to the College of Engineering. I strongly believe that Texas A&M University has one of the best construction programs in the country. The curriculum for Construction Science within the College of Architecture takes a unique approach to training students to become future construction professionals and leaders in the commercial and residential construction market. Graduates are much better prepared to enter the construction management ranks and make an immediate impact compared to other universities where their construction department is housed under civil engineering or another specialized engineering division. Texas A&M's Department of Construction Science has built a very strong reputation in the construction industry across the nation and especially in the state of Texas. The job placement rate for graduating students is very high. You only need to walk through the Construction Science Career Fair to see the time, effort, and expense companies put into recruiting these students for jobs and even internships. All this to say that despite what the report says, Texas A&M already has the right setup for Construction Science and Architecture. The interaction between the departments, and the industry specific curriculum generate graduates each year that are ready to enter the construction management workforce. I appreciate your consideration of my comments.

There are concerns amongst the Construction Industry regarding Rationale #9c, which recommends moving the COSC department from the College of Architecture, to the College of Engineering. I do agree that there are connections between the COSC department with Civil and Mechanical Engineering, and that future field lab opportunities on the Rellis Campus may give the appearance of more collaboration than actually exists. The current pairing of housing COSC in the College of Architecture represent a stronger connection that directly mirrors the structure of the "real world", where Contractors and Architects must form trusting, collaborative teams to execute challenging projects. Though engineers are a vital part of building design, they typically work for an Architect and have lesser direct contact with the builders. The Construction Industry Advisory Council (CIAC) has partnered with the Department of Construction Science since 1999. The CIAC is the envy of every other COSC program in the country due to its membership of ~220 companies, creation of endowed scholarships for the students, and dedication to recruiting and developing the COSC graduates. The CIAC has worked closely with department leadership to offer feedback from the needs of industry. There are concerns that the level of support offered by the CIAC may decrease should a move to the College of Engineering be realized. Specifically, the skills that the Construction Industry seeks are different than those taught in the College of Engineering. There is little practical value to require a COSC student to accrue credit hours in the engineering math and additional physics. The 120 hours would be much better spent in following the existing catalog structure.

---

I was in the graduating class of 2019 in Construction Science. I'm not in support of the department of Construction Science joining the College of Engineering for a few significant reason. 1. The Construction Science department is already highly successful within the College of Architecture and is recognized as one of the most successful Construction Science/Management in the nation. 2. The College of Engineering at TAMU is already extremely competitive and overly populated that additional admissions into the specific degree plan is required after Freshman year. This would significantly harm the admissions and recognition for the department of Construction Science and would not bring value to the College of Engineering. 3. The career paths for graduates in Construction Science are very different than graduates in College of Engineering. Construction Science primarily prepares students to become professionals in managing construction projects in the Industrial, Commercial, or Residential sector from the standpoint of a Owner, General Contractor, Subcontractor, or Real Estate Developer. The degree plan is tailor made based on the demand of companies in this industry and purposefully does not include certain design courses that engineering students take. Instead, they're substituted for courses in scheduling, management, accounting, finance, planning or estimating, which are all vital for the construction management industry. 4. At the career fair, based on the current degree plan for COSCI, there would be a significant amount of companies that would not hire Construction Science students (and vice versa for Engineering Students). That's why Construction Science has its own Career Fair, separate to Architecture Students, due to the demand from the construction management industry. 5. The college of engineering generally has advanced expectations for faculty in both academic degrees and research requirements. However, some of the best COSC professors are industry professionals who may not meet these expectations and could be replaced by research professors. This would be a great detriment to the Construction Science department since there is a need for both industry professional faculty and research faculty.

---

I am a former Construction Science graduate, class of 1999. I have 21 years experience in the commercial construction industry. I am a Sr. Estimator for Bartlett Cocke General Contractors. We hire many graduates from the program. I will say emphatically that the department of Construction Science does NOT belong in the College of Engineering. I can see how some may think this makes sense but I have to believe that the vast majority of people that have actually worked in this industry would disagree. The engineering portion of my degree has been the least useful in real life. We are much more business professionals in a specialized industry than we are engineers. We are not hired in the industry to engineer ANYTHING AT ALL. Engineers are hired for that. We are managers. Communication and management skills are the most important traits we need, not solving engineering problems. We do work way more closely in the industry with Architects than we do engineers so it makes more sense to be part of the school of Architecture. The best thing the university can do is to listen to the opinion of the CIAC on this one.

---

I do not support the Construction Science Department moving to the College of Engineering. -"The Department of Construction Science is nationally recognized as a top program by the construction industry." Parts of the Construction Science program will not be the same if the department is moved to the College of Engineering and might cause it to not be one of the top programs in the nation. If other universities construction programs are not as highly ranked as A&M then why would we change to match what they do? -The Department of Construction Science career fair is almost as large as the entire College of Engineering career fair. Construction companies need this focused group of students. (MEP) Mechanical, electrical, and plumbing subcontractor's have the opportunity to recruit from the College of

Engineering and instead choose the Department of Construction Science.

---

Please reference recommendation #9C Maintaining the Department of Construction Science within the College of Architecture is very vital to the overall construction industry operations. This department and the involvement of the CIAC is rivaled across the country for the overall program and the talent. This department fosters the type of talent that this industry is attracted to when it comes to overall business acumen and thorough communication skills that are developed within the curriculum and internship programs. These skills are necessary when it comes interdisciplinary relationships with Architects. Staying in the College of Architecture allows collaboration with the Architecture students which is vital as both transition into the industry. Residential construction could potentially have a significant negative impact without maintaining the Department of Construction Science within the College of Architecture. Roughly 25% of the students who graduate within the department go and work in the Residential construction market. Our industry is making significant impacts when it comes to Diversity, Equality, and Inclusion. This diversity of thought mindset is very important to the industry and the Department of Construction science shares the goals the industry is striving to be better in. Overall talent, Interdisciplinary relationships with Architects, residential construction, and DE&I are just a few examples of how these areas will be negatively impacted if the Department of Construction Science is moved to the College of Engineering. I love the college of engineering, in my opinion it's the best in the country, however, if the Construction Science students wanted to become Engineers they would have started in Engineering.

---

I see this as more of a grab for the university to get higher ratings rather than trying to cater to students. However, I do understand the necessity of merging the sciences into one college so that it doesn't look like as much of an after-thought of adding colleges for recommendation 1 as well as from a funding standpoint if the colleges are closely related, why not just have one. For recommendation 2, given the Visualization's success in the career field as well as the performing arts, I agree that they do deserve to have their own school in order to have the equipment and studios necessary for further success. Recommendation 9a, I believe would be counter productive. Having a University Studies degree is dangerous as it is in giving the students the freedom to create their own degree, although, right now the only stability it has currently is being tied to a focal point within a specific College/School. In moving all University Studies programs to a sole college, I struggle to see how this would give the students a specific structure and how they would basically end up with a degree that is all over the place and them not know what to do with it. I believe that in allowing the University Study programs to stay in their current Colleges/Schools create a more structured environment for students and it still allows them to have that choice of studying something within their college of choice without doing the main program. Having a little bit of a combination of studies where as the whole program being open for a hybrid of who knows how many disciplines and the students not know how to apply it later on once they graduate. Recommendation 9b, would recreate that isolated atmosphere that the College of Architecture has grown so far to remove. Students of the College of Architecture are able to interact with other students of COSC and students of VIZ (which they do deserve their own school - what if the COA offered more courses in BIM and or other building software that would take the place of the Viz courses?), that interaction is necessary for the growth of students looking forward to their career paths. The career world still struggles to merge COSC and Arch students even though their disciplines are tied in more ways than a lot really think. I honestly think that COSC students and Arch students should have more overlapping courses so that they get to see how much their disciplines truly work together. I do understand, however, how the COSC program could be moved to the school of engineering given the schools push to be more STEM focused. What if there were courses offered in the new School of Sciences and Arts where students from COSC/ARCH/ENG would all have to take in order to better prepare them for the collaboration they will inevitably have to face in their career if their focus is building. There are students such as myself where I find myself working in a Construction role within an Architecture firm. I did not take any engineering courses or saw the need to and there were a few classmates that felt the same. In our line of work every discipline is separated to begin with.

---

While I agree that separating the Visualization Department could help grow the program, the influential faculty are from the college of architecture. This program is a jewel and care must be taken to not diminish what makes it great just to make it larger. As a graduate of the college of architecture, it was good for us to receive cross education. Environmental design, landscape and construction science could learn from the adjacent degree programs to get a more holistic education. The science behind construction makes for a better architect. I feel these should stay in the college of architecture.

---

My wife and I are both former students, who have been supporting our three Aggie children during their current academic careers at the main campus. What we have observed is that the Colleges already struggle to support academic

and career guidance with the limited budgets afforded them. While they are doing their best under the circumstances, I can't imagine how lumping multiple Colleges into one bastardized amalgamation is going to further the interests of the students, where their respective College should be their unique home for higher learning. What I see in this plan is a homogenization of education for the sake of monetary efficiency, where study tailored to future careers is placed in the back seat to a very limited group of drivers. It will thus be impossible for said drivers to have a firm grasp of the diversity of needs for such a wide array of areas of academic expertise, and that is a bleak prospect indeed. Nearsighted is the best way I can think of to describe this proposal. Hopefully, visionary minds will see a far more diverse path on the horizon for the University, and the Colleges it seeks to foster. Thank you for your thoughtful consideration.

---

As someone who graduated from Texas A&M and majored in Construction Science, I understand the importance of this college in the department that it is in. There has been concerns for years that moving construction science to engineering could affect the college as a whole (that it has a chance to be dissolved), and it could affect students who cannot be accepted into the engineering program, but can get accepted into construction science. I attend careers fairs for my company for construction science, and I speak with students quite often. By realigning this college, there could be massive implications to the college and could in turn affect the construction industry because of it. It is the best construction degree in the nation and is widely known in the industry of being the best. By realigning, we are limiting the students who may not qualify to be accepted into a general entering program (when all they want to pursue is construction science). Therefore, in turn I believe the attendance of this college would drop, and shortly after, may merge into another college or dissolve completely, which has been a concern for quite a long time. I believe the best thing for this college, the students who want to pursue this degree, and the construction industry as a whole, would be to protect this college, and separate it from the college of engineering.

---

I think moving COSC to engineering is a great idea and should be done. However, it should not be changed to impact the type of students that get in. "Blue Collar" & "make it happen" students should be the target like it is now. Not your typical math wizard engineering students. Also the current curriculum should stay the same at its base allowing for business and management orientated classes. Current classes need to be better tailored to actual construction requirements, COSC is on the right track but there is more they could do. Less than half of what I learned in the class room is actually applied in my field. I'd say 90% is from my internship. I think a way to do this would be having a class where you actually have to build a fake building. Set it up of a past building that was built with all its RFIs and ASIs and subcontracts and have a team discuss everything that went on each step of the way and then use that knowledge to make assignments and give these problems to a student ran team and have them figure out how'd they fix it. Include the weather impacts and delays and new drawings and mess ups in the field and teach them what the process of building actually looks like. Scheduling could really be run vamped to teach how to build a building with a teachers logic on each step of the building process.

---

As a recent, former student and graduate from the Department of Construction Science (December 2018), I strongly advise against the recommendation of moving this department underneath the College of Engineering for the reasons below and more. I currently work for one of the largest general contractors in the state of Texas and have been placed on a unique, once in a lifetime project (TEES BAM Facility) due to my success that was founded from the prominent education I received from Construction Science being underneath the College of Architecture. First, the statement of there being "significant connections between this department and the Department of Civil Engineering, Department of Mechanical Engineering, and Department of Engineering Technology" couldn't be farther from the truth. Not once during my time in the Construction Science program did I have any associations or interactions with any of those three engineering departments or any of their classes. Whatever "significant connections" are being claimed to exist are purely theoretical. While a basic understanding of a select few civil and mechanical disciplines and concepts can be beneficial to a student of Construction Science, those are more than adequately covered in the department's current curriculum. Further, the deeper learnings, calculations, and design/engineering one would learn in any of those engineering disciplines and their basic classes greatly eclipse the knowledge necessary for Construction Science graduates to perform actual, real-life jobs in the professional construction industry. Second, a shift in focus toward any of those engineering disciplines and away from Construction Science's current curriculum would be greatly detrimental to the department's national academic standing and prestige. The current curriculum efficiently places a strong focus on the business aspect of the industry, such as management and construction law, finance, accounting, and other disciplines to prepare students for managing project contracts, budgets, schedule, and personnel. A potential shift towards design concepts would take away from the vital business understandings mentioned previously and contradicts what construction management professionals actually do on a daily basis. Anything past very basic design concepts

should be left to design professionals. Third, engineers rarely take the lead on construction projects. That responsibility is usually delegated by owners to the architects, who then rely on engineering disciplines for specific designs and calculations and construction management firms for the actual construction management process. Construction managers often collaborate with engineers through the architects since engineers contract directly with the architects as consultants. For this reason, strong relationships between contractors and architects are vital to the success of both industries. Housing the Department of Construction Science under the College of Architecture perfectly enhances the ability to achieve collaboration between the two disciplines. During my time at A&M, I was able to achieve a much better understanding of architectural processes than I would have if my department was under the College of Engineering and was separated from the College of Architecture altogether. I was also able to create relationships with architectural students that will carry forward into the professional world. Thank you for your time in reading this feedback. I hope you found my personal feedback and experience valuable and enlightening and will stand by the current structure for the Department of Construction Science under the College of Architecture.

---

Disagree with moving Department of Construction Science from the College of Architecture to the College of Engineering

---

This recommendation is a DISASTER! Liberal Arts and sciences and Geosciences should ABSOLUTELY NOT be combined! The College of Geosciences and particularly Meteorology is one of the top in the country. This recommendation would only water down The college of Geosciences and would affect the reputation of graduates from that department. My daughter is a current senior in Meteorology. That department is already underserved by the university. Honestly, this recommendation is shocking!

---

We need to reduce or eliminate the College of Liberal Arts. Reassign science degrees to appropriate College.

---

This is absolutely the worst idea. To group liberal arts with sciences is in my opinion horrible. There is purpose for every degree but trying to combine or align these groups is illogical. The liberal arts focuses on subjective and qualitative observations of the world. But the sciences focus on the quantitative iteration interpretation of our world. To mix these two vastly different perspectives is not valuable. The university is struggling to get students who are the best of the best through the engineering programs. I see the same fate combining the LA with sciences. The science students will suffer as a result.

---

Liberal arts and Sciences need to be separate departments. LA deals in subjective reality while the sciences deal in objective truth. Their perspectives on reality couldn't be more opposite or incongruous. Sciences deal in research that is funded by corporations that liberal arts has no way of relating to much less has any business courting for funding. Support for science students will be undermined by this maneuver and the future of sciences at this university will be compromised and eventually cease to exist.

---

Combining into a College of Arts and Sciences is a positive idea and would hopefully give those now separate colleges a more unified voice at TAMU. That doesn't mean I'm in favor of adding departments that don't have enough students to support the faculty needed for a degree program. In the last decade we eliminated many teaching faculty in areas that have tremendous growth in students. Any new departments should be self supporting. TAMU does not need to have every degree program out there.

---

Moving Construction Science out of the Architecture department will not help the construction of buildings. Maybe there needs to be two programs. One in Architecture and one in engineering.

---

Recommendation #1 - No. Leave the College of Liberal Arts and Sciences alone as they are. I understand wanting to reduce costs but at the students expense, No. Recommendation #2 - No. Let students that want a Performing Arts degree attend other universities that specialize in that area. Put that money into the programs we already have instead of creating a brand new school. Recommendation #3 - Yes Dept of Journalism - I think this could be done under the Liberal Arts without having to create a new school as recommendation #2. Recommendation #4 - No. By doing this, I see it diminishing A&M's conservative values. Strengthen the Dept. of Political Science classes instead without the merger of the Bush School. Recommendation #6 - Leave the libraries as they are. All this move does is create faculty positions that would want higher pay.

---

Do not combine departments

---

All academic situations should be on merit based only.

---

I love the ideas of restructuring college advising and recognizing that most students do not know what they want to be

when they grow up and trying to fit them into a mold at age 18 is not creating a successful environment for them.

---

I support the recommendations.

---

Do not make any of these changes. A&M is better than the "peer review" schools so why do we want to lower our standards to meet them? This was a total waste of time and money!

---

My primary interest in this realignment is consideration of creating a new Journalism program. I was part of the J program in the 1960's (although my degree was granted by the College of Agriculture). My experience in the J program was a good one. Our professors knew what we had to learn to become contributors to the profession and the community we served. It is my hope that any "new Journalism program at A&M has a bedrock commitment to making sure the major turns out "honest brokers of information". There will undoubtedly be a tendency to want to turn out journalists with a politically conservative bias--and that would be wrong. Earl Rudder, for all the great things he did for A&M, really wanted the student newspaper to function, essentially, as an information outlet for university leadership--sort of a military-post newspaper. It was wrong then and it would be wrong now. Alternatively, it would be wrong to create Journalism culture at A&M that drew crusaders who see themselves as agents of change to correct the ills of society. All a journalist really has to offer is his or her credibility and that comes only from being trained to look critically at all sides of all issues and report from a down-the-middle viewpoint. Too many journalists in the media today have abandoned all pretense of being unbiased and, instead, land on the right or left politically. That approach has caused the general public to, in too many situations, ignore the trained writers and editors in favor of following social media in ways that reinforce their own confirmation bias.

---

None

---

I am not aligned to the suggestion to combine Arts and Sciences into one large department. I realize other universities do this, but I feel this would minimize/dilute the stature of the Sciences department at A&M. Sciences have been one of the academic attractions for A&M and don't want to see that reduced in order to give the school for main departments (agriculture, engineering, medicine and the Arts & Sciences).

---

WOW, that's a lot of change and realignment! I'm concerned that your 4-legged stool does not mention the importance of Mays Business School and increasing TAMU's presence in undergraduate finance (investment banking and private equity) nor does it encourage recruitment of business students to get an MBA at Texas A&M. When was the last time you traveled the U.S. and someone mentioned they got their MBA from TAMU? Many hundreds of Former Students with degrees in finance or accounting from Mays have proudly declared they completed their MBA at The University of Texas just across the Brazos River, yet there's no mention in this survey of trying to rectify that. For TAMU to gain higher university rankings and infiltrate key areas of law, medicine, and business around Texas and beyond, our undergrads and other schools' undergrads must become feedstock for our graduate level programs of MBA, law school, dental, medical school and vet school. You've got vet school, law school, dental and medical schools covered in your 4 legged stool, but you fall short in the area of business and entrepreneurship. That needs to be addressed. I also worry about CEHD and all the departments you would strip from them. How are they responding? I serve on the DDC for CEHD and have heard nothing about this so far. Yes, a focus on educators and administrators is extremely important, but CEHD's Former Students do not generate a lot of extra cash to give back to the school. This will jeopardize much over time, especially educators and administrators. If we are doing our best in STEM and STEAM, we should also be increasing the number of students who want to participate in AGGIE TEACH so that we have Aggie engineers, biologists, artists, and mathematicians who want to teach our Texas children in Texas public schools. I'm in favor of consolidating and realigning where mentioned and minimizing redundancy, but not at the expense of any one college. I do agree the Bush School should have a larger presence and agree with movement of mentioned departments/degrees there. I'm concerned with the direction the Arts and Sciences will be headed, as well as a journalism department. We want to continue to differentiate ourselves from the University of Texas, otherwise we look like 2 identical large flagship universities that are simply located in 2 different towns/cities.

---

I think the academic realignment makes a lot of sense. The situation in the College of Architecture is a perfect example. To increase the architecture program's national rankings, efforts need to be focused on creating a more rigorous design curriculum and attracting more talented faculty. Architecture is not traditionally one of TAMU's stronger programs, but the potential is there. Due to A&M's physical location attracting some students to the architecture program can be difficult. B/CS does not offer what a program based in a larger city can offer. It might be worth moving the architecture program to larger city altogether. Most reputable design programs are in urban centers. Look at the success of the

---

architecture programs at UT Arlington and UT San Antonio over the past 20 years. As a design student most of the studio projects were based in Houston, Dallas or Austin, not in B/CS. Architecture at A&M needs to decide what it wants to be as an academic program. By allowing almost endless opportunities with multiple degree tracks and areas of study it has created a lack of focus for the program as a whole.

Combining Liberal Arts into a larger department of Arts and Sciences makes sense, and moving some departments into Engineering also makes sense.

Recommendation #1: This doesn't make sense. You want to combine two things that very seldom influence each other in the real world just because the combined entity would be larger. Maybe combine Science and Geosciences, but not add Liberal Arts into that. Those departments have vastly different research and facility needs and should be dealt with accordingly. Recommendation #2: This is getting away from the core of what TAMU is known for; agriculture, engineering and sciences. If you want to be the best at something, you don't try to become "ok at everything".

I don't have a lot of experience here, but I would prefer TAMU focus on where we believe we can truly be "World Class". Perhaps my opinion is not fully informed, but Engineering, Agriculture, Life Sciences, Veterinary Science, Business and Government Affairs appear to be our core strength (ai may be missing a few). I'm not sure a redirection of focus and funding toward areas like Fine Arts and Performing Arts really helps our university or the world class reputation we seek. If I were voting, I would vote to allow other universities to focus in these areas and redouble my TAMU efforts toward investment in our core areas strength and strategic growth. One specific topic and area of passion for me is the Industrial Distribution Program within the Engineering Technology Department. I believe this program is SO well regarded in its field and it's graduates have developed such an impressive reputation that it should be considered its own department within the College of Engineering. As a graduate of this program, it's connection to the College of Engineering has opened a multitude of doors for me and the professors with real technical, applications and industry background provided a major jump-start to my career. This program enjoys unparalleled credibility in its industry and showcases great strength for the University....we need to promote and market its National and international reputation much better. Engineering - I spent a number of years in the Semiconductor industry and have been involved in technology innovation most of my professional career. I'm concerned that the College of Engineering does not focus enough on the critical Semiconductor/ Electronics industry at a time when global and National interests are oriented here. If we focus here, we can dominate.

Moving the construction science department to the college of engineering would be detrimental to the program. With 100% job placement, construction science is the university's most successful program in terms of setting students up for success. A majority of transfer students into the program come from the college of engineering. This is because the general requirement classes for engineering are extremely difficult and "weed out" many of their students. Those classes do not align with the construction degree and are not necessary for us to take. Moving the department of construction science to the college of engineering would eliminate a second change for those students and would serve as a road block for the success of the department. Also, after graduating and working in the industry, construction science graduates work directly with architects every single day. We very seldom interact with engineers throughout construction. It is imperative that the department of construction science remains in the college of architecture.

Academic realignment into four (or, however many) units should not take place without a clear understanding of how 'minor' academic units will fit into the larger units without losing their identity or purpose. Responsibilities and support of ALL academic units should be clear. The economy of the efforts to reorganize academic units must be clear, and they must not sacrifice the existence, identity or capabilities of smaller units.

Performing arts? We seem to be reaching based on schools with a different demographic. If it ain't broke, don't fix it. We could be journeying further away from being world class. TAMU is unique not cookie cutter.

The MGT Report proposes the creation of the Department of Journalism, situated in the College of Arts and Sciences. As a journalist for more than 30 years, in print, broadcast and radio, who has a master's degree in mass communication and has taught as an adjunct professor at SMU, I feel uniquely qualified to voice an opinion. We need to think bigger than a Department of Journalism. I would prefer a School of Journalism and Communication. We need to consolidate TAMU journalism (faculty, programs, degrees, and resources) in the rebranded department. Department head Hart Blanton has a great vision for what the School of Journalism and Communication can be and, frankly, should be going forward. The University of Texas has a model for TAMU to follow, with a Texas A&M former student running the department. Journalism encompasses so much more than it once did. Print journalism is dying. (No one knows this better than me, having been laid off from a newspaper in 2017.) We need to adapt with the times and offer a multifaceted education. I

think this is easier done in a School of Journalism and Communication.

I believe if we did not continue to increase enrollment numbers realignment would not be the issue it is. If more and more students are allowed we will continue to lose what has made us us. It becomes sadder and sadder every fall when I return to campus and spend as much time as I do there. What made our beloved university unique is no longer. We have become just like every other major university, how many 18-22 year olds can we shove in a class or dorm that will give us their money? Currently what is it? About 55,000, with about 50,000 of them not believing in the Aggie Core Values. Heck they probably can not even name one of them.

CoSci should not be a part of the the College of Engineering. It should remain as is.

[REDACTED]  
[REDACTED] reading the "Academic Realignment" section of the report I see Recommendation #6 on page 32 suggests merging the University Libraries into a newly created College of Arts and Sciences and creating a new Department of Library Sciences. The Press reports up through the Dean of Libraries. How would Recommendation #6 affect our impressive, award-winning Press? When I first joined the Advancement Board 10 years ago the Press reported through the President's office, which was entirely appropriate considering how important it is to the University and its proud history of publishing exceptional works. A new Provost moved the Press' reporting to the Provost office and then eventually under the Libraries. Is the Library the best place for our Press to reside? I realize this is how some universities have it structured, but I'm not sure this kind of structure is best for A&M. Please compare the size of our Press to the University of Texas Press and other prestigious universities. I think you will find the Press to be quite a bit smaller than our friends in Austin. This grates at me. Would a different, more visible, reporting structure and a commensurate increase in funding allow the Press to serve more citizens of the State of Texas and better reflect its contribution to our great State? After all, the stated mission of the Press is: "Our mission is to be the preeminent academic press in selected fields by publishing high quality books and other works that educate readers and advance knowledge in the most technologically efficient and fiscally responsible way possible, while enhancing the stature and reflecting the mission and growth of Texas A&M." Please note that the Press is largely self-sustaining and requires very little financial support from the University, relatively speaking. We all desire the best for A&M and our Press. I do think it worthwhile to consider the best reporting structure for the Press, as well as levels of funding, to enable it to flourish.

Stop this diversity and inclusion madness. You are wasting money and teaching the wrong thing to new generations.

N/A

I would like to recommend that significant increases in financial be focused in the areas of medical research (Alzheimer's/dementia) and space exploration). I want Texas A&M University, one day, to be the predominate leader in these fields (above all other

Thank you for the opportunity to provide feedback on TAMU's MGT Report. 1. Comparison(s) to "peer" universities. This phrase was used throughout the report, not just within the Academic Realignment section. There are times and places where regressing to the norm is appropriate and there are times where an organization needs to stand apart from its peers. I felt the report predominately used the term in a negative way and rarely (if ever) acknowledged the positives in taking a different approach to educating students as compared to peer schools. 2. Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. a. Rationale 1: The new College of Arts and Sciences will heighten its stature as the home for one of the largest undergraduate curricula at TAMU. Comment: While I am completely oblivious as to how resources are distributed amongst the colleges, the only way an "increase" in stature makes sense if the new College out-competes the remaining colleges at the University relative to the current baseline. For example: Assume Arts, Science, and Geosciences each get \$1 in university support, \$3 in total). If the new College of Arts & Sciences would get \$4 in resources because of "increased stature" – okay. But if the new College gets the same \$3, so what (putting aside savings in administration by having one Dean vs three Deans). Bottom line: Not evident in the report as to what "increased stature" brings to the argument for combined the three schools. b. Rationale 2: TAMU's College of Arts and Sciences would align with similar colleges at most of its peer institutions: 12 of 19 peer institutions use this model. Comment: The statistics are roughly a 60-40 split. ~60% of peer institutions have a College of Arts & Sciences, ~40% do not. While 60-40 split is a landslide with respect to general elections, the difference is not that far from a 50-50 split. Likely the "peerest"

of the 19 peer institutions is the University of Texas – Austin. And UT-Austin has an independent College of Geosciences. If TAMU is competing with UT-Austin for geoscience undergraduate students, graduate students, and faculty, then maintaining parity with its in-state peer by hosting an independent College of Geosciences would enhance its ability to attract top talent. c. Rationale 3: This larger college structure creates a stronger advocacy for the liberal arts education at a STEM-focused university. This advocacy is a value in recruiting faculty in the arts, humanities, and social sciences which are often underrepresented at STEM-focused universities. Comment: While I am in general agreement with the reasoning presented in this rationale, the fact is TAMU is Land Grant university. d. Rationale 4: ....there should be significant cost savings by reducing three administrative college structures into one and using those funds to support the new College academic and research mission. Comment: I am in general agreement with this rationale. e. Comment: TAMU is a Land, Sea, and Space Grant university. It was not apparent to me that the MGT report acknowledges this fact – which enhances the argument for maintaining an independent College of Geosciences.

---

Texas A&M is a STEM-focused university. This is the strength of the university and what lends credibility and prestige to the degree. It is what attracts donations and research money. I do not believe we should expand liberal arts studies at the expense of the core competencies of the university just to try to make diversity numbers look better. Texas A&M does not receive unlimited funds so money spent expanding liberal arts is money being diverted from a core strength. As a Nation, we are trying to get more kids interested in STEM competencies because the jobs of the future demand these skills. If we really want to make a substantive impact, we should be partnering with schools and reaching out to kids in primary and secondary school--especially in underserved areas-- to introduce, encourage, mentor and support these kids in pursuing an education in the STEM subjects. That's how Aggies make a difference. Also. claiming that just over half of peer universities combine their schools of liberal arts and sciences into one college is not overly compelling. There are plenty of colleges and universities in Texas that have very strong liberal arts departments for Texas kids to pursue those interests. Instead of trying to do a lot of things halfway, we focus on doing fewer things very well and better than anyone else.

---

I agree with the recommendations in the report.

---

Just because other Universities combine Liberal Arts & Science & Geoscience doesn't make it right, nor do the skills in one area necessarily translate to the other college. Maybe Science & GeoScience makes sense, but Liberal Arts??? While some of the suggestions sound good, it seems that the consultants want to grow admin overhead without a return in investment determined.

---

Combining colleges just to be one of the 'Big Four' at A&M or to be "comparable in scale to those at our peer institutions" is ridiculous. It would be worthy of consideration if realignment provided: 1. Innovative learning opportunities for students in the combined colleges. 2. A broader scope of their major field 3. An opportunity to 'cross pollinate' in similar fields other than their major. 4. Reduced costs. Combining Liberal Arts and Geo Science doesn't make sense to me... there needs to be synergy if you combine colleges. A&M doesn't need to copy the Univ. of Michigan, Rutgers, or any other university. A&M should be leading the way in offering the highest level of education in every college. If we can't do that, we should concentrate on the ones that can attain that level and forget about the others.

---

My concern is that combining College of Geoscience with the other two colleges to become a new College of Arts and Sciences is that endowments, scholarships, and other money designated for College, department, and even more specific categories. These should be sanctosanct. My warning is that “bigger is better” does not necessarily hold as the rationale given for combining these colleges is that they are smaller than colleges at peer universities.

---

As a graduate of TAMU with a degree in Community Health, I am NOT in favor of moving the program to Public Health. I currently have a TAMU student who went in studying public health and has switched to community health, so I am seeing this from multiple lenses. The nature of the CH program fits far better into the college of education, particularly when you look at what graduates of the program do for internships and careers. To a student these respective programs (CH or PH) there are indeed stark differences despite what the reviewers found. I highly discourage taking this recommendation.

---

Please do not allow the absorption of the Construction science program into the school of engineering to occur. It places the degree's faculty at risk, as well as potentially diminishes the education to those who are coming through the program. The construction industry is heavily based on experience, and requiring professors to have a higher form of education (which seems may be the case) in order to perform their duties will only reduce the quality of professor in the department. As it stands, I, and many others, have enjoyed the wealth of knowledge industry professionals such as 

These are not academic men, but are ones with experience and knowledge of the industry that far surpasses anyone who attended school and received a masters degree. Eliminating this type of person from the professor pool will be detrimental to the education the current and future students of the department will receive. You have one of the best construction departments in the country, making changes similar to those proposed can cripple such a great program. I hope that you take these notes into consideration. Thanks and  
Gig'em Class of 2020

---

This may prove fruitful.

---

I believe that switching the Construction Science department from the College of Architecture to the College of Engineering would negatively impact both current and future students. As a construction industry professional, I have had significantly more interactions with architects, not engineers. By having the program within the College of Architecture, it allows for COSC students to gain significantly more insight while in school with those whom they will be interacting with the most upon graduation once they begin their careers. While commercial and industrial construction members do have some degree of interaction with engineers, the residential builders of our industry have virtually no contact with engineers. This is a very large market in our state, and would encourage less students to pursue a career in residential construction, therefore significantly impacting this sector of the industry.

---

I'm not sure about the realignment, but I would say it should be aimed at reducing overhead and improve and shorten lines of communication. My main concern in this area is we are graduating entirely to many students in disciplines WHERE THEY CANNOT FIND A JOB. Why does A&M allow this? Do you not follow-up on recent graduates and see how successful they have been in getting a job? When I graduated the U.S. Military made sure that all of us guys would have a full time job right away - but not so today. I know many students see going to college as a continuation of their social life and choose a major they think will not be overly challenging, but why are so many spaces available in disciplines that have low job demand?? I have met far too many recent graduates who were waiting tables in eating establishments rather than having good full time jobs that relate to their major. And, - a lot of these students have racked up tens of thousands of dollars of debt.

---

In short, the the first recommendation of the academic realignment makes no sense. It does not matter what other schools do or that their college of science & liberal arts is the largest at their university. The size of the college doesn't matter. There is very little overlap between the college of science and college of liberal arts, so combining them would only serve to demolish the relationships and structures already put in place. It would put already-strained resources and staff in each college under more stress as the size of the college increases. Combining the colleges of Science and Geosciences would be a logical option, but adding liberal arts serves no sensible purpose. It only serves as a way to siphon money from the sciences into liberal arts departments. Recommendations 2-5 would be acceptable, as long as the department of Biochemistry and Biophysics was also given access to the new institute. Library science is not something that belongs with the College of Science. Having the word "science" in a name does not make it a science in the same way biology and chemistry are sciences. It's an insult to actual scientific degrees to lump liberal arts and 'library sciences' into the same college. Recommendations 7-8 are acceptable. Recommendation 9a is unnecessary. Let students in University Studies decide which college they want to be associated with. They should not be required to be in the college of science. Recommendation 9b is acceptable. Leave the College of Architecture as it is. The different departments in the college collaborate very closely to solve problems. Construction science students intentionally do not join the college of engineering. The College of Engineering is notorious for not having the space and resources available for supporting all of its students. Adding the Department of Construction Sciences would compound that issue. Recommendation 9d is acceptable.

---

I agree strongly with Recommendation #1, #2, #3 & #9c. All other recommendations sound logical. Recommendation #1: I am an engineer, but I clearly recognize that the creation of a College of Arts and Sciences will be the capstone in making TAMU (already a great university) a "complete" university of the highest standard. The resulting four academic pillars: Arts and Sciences, Engineering, AgriLife, and Texas A&M Health will make TAMU second to none. Recommendation #2: Establishing the School of Visual and Performing Arts within the College of Arts and Sciences is another strategic and tactical step in completing the "whole TAMU." In my opinion a College of Arts and Sciences would have a HUGE hole in it without the School of Visual and Performing Arts. Recommendation #3: A strong Department of Journalism is a must at TAMU. Our nation has a critical need for better journalists in all media categories, and very few universities are producing the quality of graduates required. TAMU can do that! Recommendation #9c: I believe all of the steps outlined in #9c are the proper things to do, but one that strikes me as absolutely essential is the recommended

move of the Department of Construction Science to the College of Engineering. All of the reasons in the last paragraph of the rationale are right on the money. The close relationships to the departments of Civil, Mechanical, and Engineering Technology are already apparent, and without doubt the move will create a pathway for more and better research collaboration with TEES.

---

As a long-time member of the construction industry, I think moving from the architecture to the engineering college is very concerning. The construction science department is very successful in its current status and a major change could jeopardize that nationally-recognized excellence. Most graduates of the COSC department graduate to then work for a Contractor firm. These firms typically work on projects directly and/or contractually with architecture firms, not engineering firms. Therefore the strongest need for interdisciplinary collaboration in school and in the industry is primarily for COSC-ARCH, not COSC-ENGR. Although this is true for most sectors, it is particularly a problem for residential construction which has very little engineering interaction. This move would guarantee a reduced residential construction student-graduate population, in a heavy growth Texas market. A major accomplishment of the COSC department in recent years is the increase in first-gen Hispanic enrollment. Diversity and HUB are vitally important to the future of the construction industry which is facing historic labor shortages. Moving to a college with potentially higher tuition and admission requirements would take major steps backward in this joint endeavor. The success of COSC is due to the curriculum, the faculty, and the industry involvement in the program. The proposed college change would likely have a significant effect on one or more of those three pillars, eventually if not immediately. I respectfully ask that the university continue to research, carefully evaluate, and create open lines of communication before considering this change.

---

Agree with assessment, more colleges within the University interface.

---

The consultants appear to give undue weighting to other universities that have combined liberal arts with science. If you exclude the non land-grant universities from their universe, the weighting among selected land-grant colleges is equal. It appears that the overall rationale for combining these disciplines is the creation of the largest school within the university. If the discipline of pure sciences is to be combined with any other school, any of the sub-disciplines would have more in common with engineering, agri-life and health than with liberal arts. Therefore, I do not see any overwhelming reason to combine science with liberal arts. As to a school of journalism, I strongly suggest that the president seek the views of Bob Gates who withdrew the academic discipline from within TAMU before reinstating such. I also strongly recommend that "The Battalion" not be under the purview of the journalism department if one is reestablished.

---

Right now College of Liberal Arts is the only college that is working hard to create a workforce that can address the diversity challenges of the 21st century. It is the only college that offers discussions, seminars, and courses that help broaden students' minds to different perspectives. It will be a big blow to Texas A&M's reputation if the College of Liberal Arts was forced to disappear. The university already has a reputation of being a hostile place for minorities. Downplaying the importance of liberal arts will once again show that the university does not care about diversity and having tough conversations. I am also not sure why and how the list for the peer institution was chosen. If you talk to any student or faculty, the first university that we compare ourselves to and strive to be better than is the University of Texas-Austin. The list only includes 2 universities from SEC. I am not sure why Cornell and Duke are considered our peer institute when they are private, small, and highly selective universities? The list has 3 universities from California and none from Texas. I love statistics as they can be used to convince your point. I can also easily create a list of "peer" universities where the College of Liberal Arts is separate from the College of Science. The question this report does not answer is why is this change needed? What are the costs and benefits of this change?

---

Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. Traditionally, civics, social science and history take a back seat to science when STEM becomes the priority. I see little in this recommendation to alleviate that outcome. The social sciences provide the context and why of science and math and the continued devaluing of them in our school systems from kindergarten through graduate levels are creating the conditions where citizens understand the "how" of a discipline but not the "why". We have a fundamental lack of understanding of our nation's history and contributions to the world, which results in a deterioration of our national identity, pride and sense of patriotism....the very things Texas A&M always stood for. Removing the "why" devalues the entire mission of a land grant college, which is the "teaching of practical agriculture, science, military science, and engineering—although "without excluding other scientific and classical studies"

I am in agreement with the different rationale for realignment of many of the departments cited. However, as an Architect, I find Construction Sciences are very much integral to Architecture and its practice. As a student I found great value in its curriculum and its inclusion within the College of Architecture. It became more apparent after I graduated and began my career. The recommendation to move Construction Science to the College of Engineering should be studied further.

---

None!

---

Not sure if this is Academic Realignment: Bring back Industrial Arts Education; create and mentor Shop Teachers. Re create the confidence you get from working with your hands.

---

Combining Liberal Arts, College of Science and College of GeoScience in to one college will cause the loss of specificity to the degrees. Each of the degrees offered within the colleges require a certain base element of study and significant focused curriculum to create the high valued employees that employers are looking for. You lose that specificity when you combine Liberal Arts and Science, each of which has its own areas of emphasis. Each Art or Science would lose some of its specific classes in order to complete the base curriculum requirements that each college would put on its first and second year students. This waters down the potential employee pool and makes the graduates less attractive to potential employers. As a former Construction Science graduate I strongly disagree with the move of the Construction Science department to the College of Engineering. I started as a Civil Engineer major and found my home in Building Construction/Construction Science as a Jr. In my 27 year career in the Civil Construction Business I have successfully started and built two organizations and consulted on the formation and development of others. I would not have had the base I needed to do that as an Engineer. My education in Construction Science provided me business, law, economic, public speaking, and marketing/human resource introductions. Moving this department in to the College of Engineering and requiring these students to apply as Engineering general in their first year and then trying to be assigned after their first year will cause us to lose quality students to other Universities who allow the Construction Science or Construction Technology students to focus on the contracting business and not so much on the Engineering side. Engineers and Construction Professionals are two distinctly different career paths. As an employer in the Construction industry I am more drawn to the Construction Science path because of their well rounded class background. Moving this College to the school of Engineer will take that focus away from the business side and focus it on the Engineering side. In my opinion faculty and graduates would echo this sentiment. Stating that Construction Science is just an offspring of the Civil, Mechanical and Electrical Engineers discipline is just plain wrong.

---

As a former student of the College of Architecture and a practicing architect for the last 22 years, I want to briefly address disagreement with the recommendation to move the Department of Construction Science out of the College of Architecture. For the entirety of my career and during my time of undergraduate and graduate education I have witnessed a disconnect between Architecture and Construction that is detrimental to the practice of architecture more so than to Construction. Architects seem to fancy themselves as the creative geniuses, while Construction professionals see themselves as practical, essential, and able to complete work without the help of architects whom they think are out-of-touch with how to really get things built. This disconnect starts in academia and perpetuates in practice, where it actually matters. There are consistently too many professors and instructors in both departments who have little to no experience in practice. They push ideas that further insulate and divide when they should be working toward partnering and integration to achieve success in the built environment. To move the Dept of Construction Science out of Architecture furthers the divide. Both construction professionals and engineers have been striving for years to reduce the requirements for architects and to absorb the responsibilities for design. Their efforts would strive to relegate architects to the theoretical and conceptual levels only, or absorb architecture entirely. If the Department of Construction Science is recognized as a "top program by the construction industry" then why move out one of the best things in the College of Architecture? The College of Engineering is much more varied in scope and type of engineering. Adding COSC to Engineering does not enhance Engineering, but rather makes their mission even more varied. So why is narrowing the focus of COA a good thing, while further diversifying Engineering and broadening the mission of Engineering also a good thing? Keeping the Dept of Construction Science in the College of Architecture and relocating Dept of Viz would solidify the COA as a college focused on the Built environment from planning, to design, to development and construction. If the Dept of Construction Science is moved out to Engineering, I anticipate we will accomplish nothing to improve our "ranking" as a COA, but will just further divide ourselves from the most critical partners we have that makes our profession a reality. I would encourage you to have more conversations with practicing architects and construction professionals. In short, I believe this is a terrible idea.

If it ain't broken, don't fix it. Nothing I read in the entire report convinced me there was such a compelling problem with how our schools are aligned now that any of them really need to be shuffled around or combined. Just because other schools organize their colleges a certain way doesn't make us wrong for doing it another way. Similarly, there is no compelling need for a Texas A&M School of Journalism, other than the report authors' personal opinions about "fake news". I've never thought of Texas A&M as a school that turns out journalists; we just aren't a journalism school, and there's nothing wrong with that. Similarly, the best-known journalism institution at Texas A&M, the Battalion, is regarded by the majority of students, current and former, as a "liberal rag." Right or wrong, its views are far askew to those of the rest of the university, and to further invest into such a program without correcting that misalignment would simply be irresponsible.

---

The idea of merging the college of liberal arts into a broader college of arts and sciences is very interesting, particularly the suggestion that doing so would actually help increase the opportunity for the arts to be heard by and contribute to the wider academic community given that A&M tends to be a STEM-focused environment. However, steps should be taken to ensure that the liberal arts departments retain appropriate independence within this new structure. The recommendations regarding community outreach, particularly in the area of artistic and cultural outreach, show a lack of knowledge regarding what A&M already offers. MGT says we need a modern performing arts center, and museum spaces, but does not seem to realize that we already have the Rudder Complex, Bush Library, Reed Arena, Corps Center Museum, and MSC galleries. Existing facilities could be improved and/or expanded if not already sufficient for any new programs the university may wish to add, making new facilities an unnecessary expense cutting against the general emphasis on efficiency. The proposal to elevate journalism to a full department is an interesting idea, especially given the drop in media trust and media literacy noted by MGT. However, simply elevating the journalism program by itself will not address this issue. In order to help restore trust in journalism, we must help restore a diversity of ideas and viewpoints to journalism. A&M will not be able to contribute to the needed view point diversity unless we emphasize academic excellence and diversity of thought as previously mentioned in response to Faculty Affairs and Academic and Strategic Collaborations.

---

If the academic realignment serves to strengthen the education in each degree plan, then it makes sense. However the realignment (as I read it) primarily serves to streamline the management of the university from a "back-of-house" perspective. Some of the suggestions do not make sense for degree-serving purposes.

---

I believe that the department of construction science should stay in with the college of architecture....in the real world they work hand in hand. Better collaboration is recommended not separation.

---

To whom it may concern: I apologize in advance for leaving the other fields blank. I don't really have much to add in the other fields, but do have a very personal stake in the academic realignment. As a graduate of the University Studies Journalism Program in 2018, I feel that it is vital for the school to establish a journalism school with the appropriate funding to back it. A big reason I went to A&M in the first place was an Aggie Journalism graduate who was my professor in community college. As one of the best schools in the country (Gig Em'), there really is no reason or excuse not to have a Journalism School. I never wanted to attend anywhere else to pursue a degree in journalism, so I felt like I took what was available by majoring in University Studies Journalism. This isn't to say I'm not proud to be an Aggie or of my time at school, but as Aggies one of our core values is: Honesty, and I owe my school that much. It's funny because when someone would ask me what I majored in, I'd answer with "Journalism," which was true to an extent — but I feel didn't hold the same weight as a degree from a program with a journalism school. Many of the classes in the university studies program were predicated on completing two minors, which, ultimately I felt provided little to no benefit to my overall pursuit of a career in journalism itself. Now, don't get me wrong, — there were several communications classes I thoroughly enjoyed, but I don't feel I would've taken them had there been a journalism school. The same can be said of the Sports Management classes I took, however, those were not beneficial to my degree other than to meet the requirement of taking two minors. I feel there was a strong disconnect between the field experience needed to work in journalism and what resources the program had available. I don't think this experience was found in class, rather than it had to be found outside of class. Despite these limitations, I took it upon myself to cut my own path. I wrote for the Battalion, The Eagle, and TexAgs during my time as a student at A&M and am really proud of the work I did for each outlet. Had I not worked for those outlets, my overall experience would not have been the same. The program requirements were the not right connection to the experience needed to be in the field of journalism. My hope is that a journalism school changes all of that for the next set of Aggies interested in writing and reporting. A&M bringing its journalism school is long overdue and a step in the right direction for the school as a whole. As someone with a career in education, you strive to see your students succeed and thrive while teaching them to think critically for themselves.

Although a journalism school isn't something I will experience personally, the next generation of A&M journalism graduates will be shaping the future and I hope I have the privilege of teaching some of them personally. Maybe they'll be inspired to attend A&M as I was by a fellow Aggie. But, when my students ask me what I majored in, my answer will still be, "Journalism." Thanks and Gig Em' [REDACTED] Class of 2018

---

Keep COSC in the College of Architecture!

---

I would welcome this. A school of liberal arts could be folded into a school of modern communications.

---

These recommendations appear to be sound. Having a Department of Journalism is something that should happen immediately. Earl Rudder was wrong on this issue.

---

I was very heartened to see Texas A&M's report highlight the need for a journalism department. News-gathering and fact-finding are important needs for the world right now, and if A&M is to remain a world-class university, it needs to demonstrate that it can teach the skills for its future citizens. It also needs to protect and embolden The Battalion as a voice for students unimpeded by university administration. The only thing I would add is to consider going beyond a journalism department and making it a School of Journalism, which would not only allow for more resources but also protect traditional niche offerings like agricultural journalism but also add new ones like social media and data journalism. This would be a big step forward for Texas A&M, and I hope you'll consider making this a reality.

---

Approve, except put the Battalion under the communications department.

---

Transfer COCS to COE. An initiative or recommendation I fully support. My experience attending TAMU School of Architecture, graduating August 1977, is that the most meaningful courses I undertook were in the Dept. of Engineering (COE) or the instructor was from COE and was sequestered to COCS. I strongly recommend giving COCS an "Professional" engineering focus and furthermore providing the prestige of an Engineering degree having the capability for the graduate to test as an EIT (Engineer in Training) and become a PE (professional engineer). The engineering courses I took in the COCS program were equally as demanding as similar courses taught strictly within the COE. I can name many examples. All of our foundation courses in math and sciences were exactly the same as those required within the COE. This change would step up the prestige of the COCS Dept., which is already highly regarded, but needs to be taken to a professional degree level.

---

I am a graduate of architectural design. Class of '57. My comments are based on 50 years personal experience as draftsman, designer, construction documents, field supervision, and consultant to developers and lenders. I agree that Construction Management majors of my period developed into leading construction personnel in the field. I also believe that their early association with us, first 2 years, gave them an edge. Design majors of my period needed more Business Management training. We had to learn it all the hard way. I can see reasoning for the recommended realignment of the College of Architecture. Degree Plans with crossover courses could embellish Design and Construction Majors. Another possibility is the construction of degree plans with Design and Construction offered as master's degree Programs after appropriate degrees in other fields.

---

The creation of a school for the arts and including the dance majors would create a greater sense of community among the arts community at TAMU. I am so glad to see dance considered so much in this report, considering how wonderful this program is.

---

If Construction science is realigned with engineering, can the college of architecture still foster a relationship between the two departments? These relationships and understanding of one another are critical within the practice of architecture. We should be emphasizing the importance of technical building as well as design.

---

Creating a central location for the arts would be beneficial in a multitude of ways. Firstly, artists inspire other artists. In the current state, dancers are on the opposite side of the campus as visual arts. There is no opportunity to collaborate or inspire each other. Having this shared facility would spark many new ideas and collaboration between different types of artists. In addition, the arts seem to be secondary to other "more important" majors. Having a building dedicated to them would help these students feel more cared for at the University setting them up for success into the future. These students like to be involved and sometimes it feels like they are left out. Texas A&M will be a more well-rounded and inclusive campus with these adjustments. Thank you for this consideration.

---

I have mixed feelings about COSC being split off from the College of Architecture. I know when I was a student there was not a feeling of unity between both departments. As well, I do not think that being moved to the Department of Engineering would be any better, even though there are some engineering type courses I remember taking; Surveying

---

and Soil Mechanics. I feel like COSC would be looked down upon by the College of Engineering as not being an Engineering degree. So I really do not know what is the right thing at the present. [REDACTED] 96'

---

I strongly advise that Critical Race Theory NOT be considered for curriculum, nor sanctioned, in any form at Texas A&M University. There is also no place on any Texas A&M campus for anti-American political, social or counter-cultural organizations. I ask with gracious humility that all departments, all faculty and staff, at all levels, remember our country was founded as one nation under God.

---

College of Architecture. I like the idea of refocusing on architecture for all disciplines in the COA. And I can see that's needed for better numbers and to make the institution work better. My main issue is the degree students in construction science could be physically disconnected from the other disciplines in the COA. Casual interaction, project teams, reverse rolls with construction science should be part of the solution inside the COA because that is a large part of what is needed in the "real world" to have great project outcomes. This observation has lots of outliers, caveats and tradeoffs. But I don't think you will lose too much if you can figure out a way to have the Architects and the Contractors start out on the same page.

---

Moving the Department of Construction Science to the College of Engineering is a bad idea. As a graduate of the program, a former faculty member, and a senior construction industry professional I can say unequivocally that the department and industry is better aligned with Architecture than Engineering. I've heard this recommendation come up before and feel that the reason outside reviewers give this recommendation is a misunderstanding as to the educational mission of the Department. Construction Science is primarily a specialized management degree, it educates students on how to manage in a highly technical environment, including reading, interpreting and understanding architectural and engineering plans and details, but not generating those details. 90% of the students go to work for companies involved in vertical building construction rather than specialized mechanical or civil engineering work. To this end the 90% are best served by remaining aligned and within the College of Architecture, working alongside the future architects that will be the primary collaborators in their field.

---

In my opinion the removal of Construction Science and Viz from the COA would be a mistake. COSC is a unique program and recognized throughout the industry. Moving it to the COE would most likely change the degree structure to more of a construction management degree and lose it's uniqueness. Viz is a special program. As a matter of fact, my daughter has applied to acceptance to Viz for next year. It is also recognized as one of the best programs in the industry. If it was moved to the College of Arts, I would assume that it will no longer be as selective as it is now and would lose some of what it is now through increasing the number of students and resulting in less personal attention from the instructors. If there were to be any changes in the COA I would suggest making the changing ED to a full 5 year Architecture program and allowing a COSC minor and Viz minor. Hopefully these comments are useful. I would hate to see the COA lose it's special place within the industry. I graduated in 1988 and can tell you that I learned more from my time there than all of my peers at other schools. Don't change.

---

Please keep Department of Construction Science and Department of Visualization in the College of Architecture. Thank you.

---

I find this rearrangement of programs to be smart, as though there is overlap with COSC and VIZA with the overlying theme of architecture, they do not fully align with the college's plan to become a more focused program centered around architecture, the profession, and (ideally) the path to licensure.

---

I concur with Finding #2 and Recommendation #2 to Establish a School of Visual and Performing Arts..... I also concur with Recommendation #9c: Refocus the College of Architecture.....and Rational #9c..... I firmly believe that making these changes will give the opportunity to all these departments to grow and excell.

---

I am a 2021 graduate of the Environmental Design program in the College of Architecture. I think the proposed changes make a lot of sense and would greatly benefit each of the programs currently under the college of Architecture. I think moving CoSci to Engineering will move people in that program closer to home and allow them to actually explore deeper practices in their field. I think moving VIZ to arts is a no-brainer. Most relevant to me is the refocusing of the College of Architecture specifically on ENDS, URBS, and LANDS. I think the change will allow these departments to focus deeper on their own disciplines and allow them to expand in ways that make sense to space-centered design, without having to share space with VIZ and CoSci. I think also by de-coupling these programs, it will in some ways force the architecture programs to adapt to the changing needs of the industry and relevancy in the world around us, which is good news for students attempting to enter an increasingly specialized industry.

---

Agree. As a COSC Former Student, the re-alignment with the engineering department makes perfect sense. It also make

sense to give the College of Architecture a greater opportunity to grow the undergraduate studies into an accredited and highly recognized program. Regarding liberal arts, a world class university like Texas A&M has nothing to lose and much to gain by developing this facet of its educational offerings.

---

I agree with all of the recommended academic realignments in the report. I particularly agree with the recommendation for a School of Visualization with its own program and facility. I also agree with moving construction science to Engineering and focusing the School of Architecture and Landscape Architecture on only an educational program that strengthens those two majors.

---

As a COSC alumnus, I strongly disagree with moving COSC to the College of Engineering. It aligns far more with Architecture than it does with Engineering. COSC students would be the laughing stock of the engineering department, as students are not required to take the same core Math, Physics and Chemistry classes that real Engineering students and IDIS majors take. I understand moving VIZ and the other realignments, but COSC has no place in engineering. In the working world, COSC students rarely calculate anything other than things in feet and inches and basic financial math. In fact, I think there is further opportunity to have COSC have more overlap with ARCH classes. COSC and ARCH alumni work together daily in the real world. COSC and Engineers do not.

---

Liberal Arts are a separate entity. Expand it with more Fine Arts.

---

For no reason should the Construction Science department be moved to the college of engineering. TAMU's Construction Science program is renown nationally, and this realignment would negatively impact the perception of this degree in the future. There is a place for engineering degrees, and it is not in the world of general contractors. I have firsthand witnessed other peers and coworkers with "construction" degrees from other universities that were placed in the engineering college and their education was secondary. Leave Construction Science alone. They are doing an incredible job while a part of the architecture college and they do not need to be included in any "25 by 25" initiatives to weaken our degrees by taking additional physics classes rather than construction means and methods.

---

It makes a lot of sense to remove Visualization from the College of Architecture to a School of Fine Arts. This move will provide Visualization a new frontier with like minded, and similar, arts/sciences. The writing has been on the wall since I was a student last decade. Also, the Master of Land and Property Development degree needs more investment and needs to have more collaboration between Mays and CoE. Its common sense. I'm currently a development manager with a development company. The individuals I speak to the most day-to-day are, engineers, architects, capital markets, and general contractors. The university needs to tie these curriculums together to better equip students moving forward in their careers.

---

Rationale #9C Moving the Department of Construction Science to the College of Engineering will enhance the educational experience and research potential for faculty and students in both organizations. This is a terrible ideal. We have enough engineers, we need builders who understand the architecture side of building. I graduated with a Masters of Architecture, Major in Construction Management. It was the best decision I ever made - I understand and support design intentions, and the buildings I construct are representative of a commitment to the Built Environment. Placing builders in engineering caters to the civil engineering and horizontal construction, not the vertical construction of buildings. I think this would take the Construction Science Department out of being a nationally recognized top program into an also ran. If our Construction Science students want an engineering degree, go into civil engineering. But leave the Construction Sciences Department in the College of Architecture.

---

Attempting to centralize all academic advising sounds like the most absurd and ridiculous idea. Academic advising on campus is already trash. Advisers don't know how to do their jobs and struggle with helping students make the proper decisions regarding Academic/scheduling choices. Now imagine the chaos when all students must meet with a centralized group of advisers and not an adviser that is available within their respective college/department. Also combining the college of liberal arts and the college of geosciences is just not a good idea. It's almost laughable. They are SO different in the classes that are required and the opportunities available. The college of geosciences is a tight knit community that receives a great amount of funding and donations just for being the College of Geosciences. Also a great amount of scholarships are given out to college of geoscience students, because college of Geosciences former students are generous in giving back. But y'all don't care about the financial strain of college on your students. Y'all just look to make your money so you can buy your next fancy house and move on. I'm done with college, and I can only imagine how ridiculously high that "university advancement fee" is now. Take care of your students and try not to do anything stupid.

The interdisciplinary structure of current academic programs in the COA is more than appropriate and should not be changed. With the impacts of climate change increasing and changes in human and natural habitats, it is more important than ever that academic programs not be siloed. Students in architecture, environmental design, landscape architecture, urban planning, construction science, visualization, and even engineering should be working more closely to learn to accommodate the natural changes caused by climate change and learn to integrate with nature. This integration is enhanced throughout the professional world and successes can be seen in many professional projects including stormwater management, habitats that include non-invasive insects and plants contributing to increased food security, and better planned and visualized human habitats that reduce the risks associated with natural disasters and increased climate impacts. In my opinion, this is the time for academic integration, especially for academic programs in the built and natural environments. Instead of separating programs for the sake of a performing and visual arts curriculum, why not integrate and enhance arts with education. The importance of STEAM in educational curriculums should be bringing academic programs together, especially for juniors, seniors, and graduate students. Visualization can be enhanced from its current home base in the COA and incorporated with other arts and education. In my opinion, all academic programs should be taking the current and anticipated impacts of climate change into consideration and structuring appropriately.

I understand and fundamentally agree with the proposal to relocate the Department of Visualization to the new School of Visual and Performing Arts in the College of Arts and Sciences. HOWEVER, it is imperative that an intentional connection remain to the College of Architecture. Advanced visualization has become a core requirement of technical capability within the architecture profession. Additionally, the technology used to deliver architecture and engineering design projects is relied upon in the media and entertainment industry to generate digital assets. Likewise, I understand that the Department of Construction Science may not be an ideal fit within the College of Architecture. However, this is equally true of moving COSC to the College of Engineering. The connections cited in the report between COSC and engineering departments is equally true (if not more so) with architecture, as architects and contractors work more closely together in the "real world" than engineering disciplines. Therefore—seeing no advantage to moving COSC to the College of Engineering—COSC should either remain within the College of Architecture, become its own college, or perhaps the formation of a new College of Building Sciences should be considered (combining the interrelated AEC disciplines).

Construction science must remain with college of architecture. VIZA could move to new college of arts and sciences, but a program specifically for architectural visualization and rendering should be created in its place within the college of architecture.

Moving Construction Science to the College of Engineering would be a mistake. If it were to move The College of Business would be a more appropriate fit.

As a graduate of the COSC program, I do believe that a move to the College of Engineering would better enhance the program. I will add though, that we must still have students taking some architecture classes to have a good understanding of how future clients and partners think and the reasoning behind designs and architectural concepts. I must stress this last comment: The COSC program is the best of its kind in the country. While we should be striving to continually improve, we cannot allow changes to degrade how well our graduates are prepared to go out into the industry. It is a very fine line stay on the right side of.

I believe the department of Construction Science (COSC) belongs in the College of Architecture. The College of Engineering is stretched thin enough as it is without adding a large department like COSC. Additionally, myself and other current and former COSC are concerned that the COSC department will have to share Francis Hall with the other disciplines in the COE, leaving little room for the COSC students that the building was originally intended for. When I was a student there were several instances where classrooms and the conference rooms in Francis were filled with classes or student groups from other disciplines in the College of Architecture. Will there be any guarantees that Francis Hall will remain dedicated to the COSC department that funded its renovation? Since there are many more engineering students than COA students I think this is a valid concern since building space on main campus is so valuable.

My comment centers around the relocation of the Visualization and Construction programs to other Colleges. This will erode the diverse amalgamation of skill sets required as a part of the architectural built environment. If space to grow the programs is the problem, then that should be solved while keeping these disciplines under the College of Architecture. Otherwise, I believe the COA will suffer and decline.

Agree 100%. Construction Science Degrees are not recognized by my current employer, the Department of State, as they are not associated with a school of engineering.

In general, the recommendations for the College of Architecture are spot on, EXCEPT the recommendation to move the Department of Construction Science out of the College of Architecture. In the real, post-academic world, Construction Science and Architecture are very tightly connected, although often seen at odds with one another professionally. Fostering this divide early by removing Construction Science from the School of Architecture would only continue to deepen this. Architecture students should learn heavily from their fellow construction science students, and vice versa. The professional world outside of the classroom is rapidly changing, and it's important for our future Architects to be versed in and understand modern construction techniques, etc, while it's also important for our construction science students to be versed in architectural design and theory. Integrating these disciplines even closer, rather than dividing them, would help make A&M's School of Architecture stand out in a way that perhaps had not been capitalized in the past.

As a Graduate of the College of Architecture, it is important to me that the College of Architecture remains collaborative with Visualization and Construction Science. I believe that having the fields of study under the College of Architecture is a competitive edge for the College that other schools do not have. The cross-disciplinary environment makes students and faculty more creative and more broadly aware of these closely related fields.

I do not believe the school should be reorganizing to better align with the goals of DEI. The school should worry about education. "Large portions of the interview and survey audiences were conflicted about the university's culture and diversity, equity, and inclusion (DEI) efforts." I am more than conflicted with DEI. I find DEI to be a secular creed hostile to traditional creeds and beliefs. While DEI sounds appealing, DEI efforts undermine the educational function of the school creating a campus climate antagonistic to education.

Leave Construction Science in the College of Architecture.

N/A

I do not support the movement of Construction Science from the College of Architecture to the College of Engineering.

See general comments for more details, but I do not find a sufficient rationale to support any of the proposed changes based on this report.

Advise tweaks that could be made to existing operations and organization to improve productivity and effectiveness. Would be far less costly and disruptive than junking existing...

I was not aware of some of the inefficiencies and duplication of efforts.

I think the academic realignment can be a powerful strategic step. However it won't be easy. There will be pushback. I do think it's worth the challenge. I am particularly in favor of placing Student Health Services under College of Medicine.

Shifting the resources will take time and transparency

I'm uncomfortable with the concept of only 4 Colleges. I think we have too many now but 4 seems too small and seems to group subjects that don't have similarities

I think that department realignment is a good idea. More resources would be needed to ensure that students could get help/a questions answered etc. when they need it with the growth of the College of Arts & Sciences specifically.

I agree, I agree, I agree. Especially recommendations 1, 2, 4, 6, and 9. With regard to the Bush School, consider including the Department of Military Science to better prepare our future military officers. This section of the report did not mention the Mays Business School which was a bit perplexing.

The Bush School should NOT be integrated with Political Science. It is so much more than that. This move will water it down. It should remain above that department, and be in a superior position to draw from various colleges (Poli Sci, International Studies, Business, Engineering, etc.) as it needs. This is a crown jewel of A&M. Protect it. Strengthen it. Do not merge it with a weak program. Merging Arts and Sciences leads to scientists having to take needless arts prerequisites. We had this in my day and it was a waste of my time. Let students have plenty of open electives, but don't force them to shore up weak departments. Arts thrive on passion, and those taking these classes should want to be there.

I am a veterinarian pathologist with over 35 years experience in private sector. Biomedical Science should definitely be dissected away from CVM

see above

Don't understand the rationale for combining liberal arts with science and geoscience. Just looks like a big blob. Don't see any synergies. Can't imagine ever seeing a liberal arts major in an advanced science course.

Do NOT combine the Arts and Sciences colleges into a single entity. BA degrees and BS degrees have different academic rigors, priorities, and academic credentials.

I noticed that the references to the College of Veterinary Medicine focus on small animal practice. This seems to be part of a trend of moving the university away from its traditional land grant agricultural mission. We've already seen the development of a vet school at Texas Tech focused on large animal practice, largely due to a perception that Texas A&M had failed in that mission. There is a growing perception among my friends in production agriculture that A&M and its services no longer meet their needs.

I sense that some departments are overwhelming others to the point that some very good potentials are passing up TAMU and selecting other schools.

We should NOT combine liberal arts and sciences. These two areas of study are vastly different and should not be combined under any condition. Why invest in visual and performing arts where a vast majority of these students that graduate struggle to find jobs in their degree field. The school should focus on preparing students for the work force and not a fantasy land.

I didn't see any mention of the Mays School or where it would fit in the four major groups listed. Otherwise, bringing Liberal Arts and Sciences together to give more strength to those areas sounds like a win. Plus, if you bring back a Journalism department, my degree won't be such a relic! This world needs Aggie journalists.

Forcing so many colleges into four major units may work. Texas A&M academics has historically been more of a "federation". It's debatable whether this will produce more effectiveness. It will not result in efficiency, as it is just re-mixing the primordial stew.

I was pleased to read the recommendation that A&M (re)establish a Department of Journalism within the College of Arts and Sciences. I feel this is a tremendous opportunity to help raise the level of trust in professional journalism, both at the local and national levels. The need for well-trained journalists who are dedicated to getting to the bottom of topics in a fair and impartial manner is more important than it's ever been ... As one of the top universities in the nation (and certainly the state), TAMU should be a leader in this regard. Instead, they're a laggard. How is it possible that we've graduated less than 25 people with degrees in journalism studies in the past two school years? I say this not only as a proud graduate (BA JOUR '91) but as a concerned citizen who has watched with concern the spread of unvetted information disguised as "news." Thank you for sharing the results of the report and for asking for feedback from interested parties.

I see no economy or benefit to combining arts and sciences into a single college. Very disparate groups with little overlap in needs or resources. Additional proposed majors would be good. All biology is not the same with different majors having different needs. No need to create an Institute of Biological Life Sciences.

The college of liberal arts barely gets enough focus as it is. As a recent graduate from this college, I had very minimal help. Combining liberal arts and sciences seems like a way for TAMU to throw every random major in there and forget about them. I will be very disappointed if that is how it plays out. I truly hope it benefits the students instead of just being a cost cutting factor.

I do not support creating a journalism school. Graduating more journalists into the world will not help with the lack of trust in national news sources. I do not support combining arts and sciences for the sake of creating a larger organization. Why is a large organization necessarily a good thing? Can some of the goals be achieved by instead fostering interdisciplinary work? I support establishing a school of visual and performing arts. I would also support finding ways to make this school accessible to graduates who have an interest in these areas but who no longer live close to College Station. I support the recommendations related to the Bush School of Government and Public Service. Texans will be well served by getting more representation in national government.

Combining the college of geosciences with the liberal arts college is a mistake. The college of geosciences has a huge potential to grow as environmental issues and sustainability are becoming more important. On the other hand, geosciences is often a place where previously enrolled engineer students transfer to- I strongly believe this is because there is limited recruiting from the college of geosciences and many incoming freshmen aren't aware of the opportunities within geosciences (this is my personal experience). TAMU has huge potential to become a leader in climate and clean energy

The law school needs a comprehensive goal. While it is understandable that they have some nebulous idea of what they want to be, it does not appear as if there is something they are legitimately striving toward.

Same as comments to Academic & Strategic Collaborations. Have any and all professors teach, explore, evaluate and understand ALL sides of an issue.

The lack of investment in a dedicated fine arts organization is a huge financial and academic missed opportunity for Texas A&M. Reinvest in the Bush school, it is too often forgotten and its influence will only fade in time. The structures of the College of Medicine and TAMU Health is really confusing. I'm still not sure if TAMU Health is even a part of Texas A&M, it seems more forgotten than TAMU Galveston. Overall, I love what the report has to say on these.

Creating journalism and performing arts programs seems like a misallocation of resources. Do what you do best. Top technical schools like Georgia Tech, Stanford, and MIT are there because they focus on their technical degree programs. Texas A&M will never compete with top liberal arts schools, but it is so very close to breaking out of the top 30 in engineering, etc. and becoming a true contender amongst the nation's top technical schools. I am not suggesting the University ignore liberal arts programs. It simply seems that this report is overly focused on these areas that will ultimately not affect near as many students as would improvements to other (existing) programs.

What makes TAMU special is how it DIFFERS from “peer institutions”, or what I would call “main-stream” institutions. The centralized academic realignment and student affairs recommendations strike me as threatening to why TAMU remains a unique institution of education AND leadership development. I received a graduate degree from the University of Michigan; I know that centralized college model — the flexibility and self-leadership in A&M’s more decentralized model is superior. We should be benchmarking with employers/industry, not the “mainstream” institutions, which A&M should not aspire to become. And by the way, what happens to the Mays School and why was it not even mentioned?

The college of Biomedical Scien

I do not like the idea of congealing liberal arts and science colleges into one. While it would make the college larger, I’m not sure what value that holds and I could see it discouraging people from applying. Prospective students looking for a geosciences degree are probably much more likely to apply/accept if geosciences has it’s own college and is not absorbed into one large college. I would also hope this absorption (if it were to happen) wouldn’t limit the amount of money individual departments receive and study abroad opportunities, or alter major curriculum. My brother is in the college mentioned in the report that the University of Michigan has, and he would prefer it be like A&M’s (separated).

Don't take good jobs and pensions from the citizens of College Station.

Defend the arts and liberal thought of A&M which would appear to be under general attack.

Purely from a high-level view, the restructuring of the university's colleges seems like a wonderful idea. As a Visualization major and Performing Arts minor (who wanted to do sound design, a totally unserved field of study at A&M) the introduction of a School of Visual and Performing Arts would turn A&M into the school I needed it to be 5 years ago without losing focus on A&M's traditionally more well-served colleges (Engineering and AgLife). All other reorganization efforts seem totally clear and sensible to me.

Be very smart about rolling everything up under a few heads that do not understand the needs of those within the group. Blanket academic requirements do not fit development of candidates who can are equipped to succeed within certain fields. You will lose institutional knowledge.

This proposal to move COSC to engineering was not thought out. The reasons cited in the report are extremely weak. I was trained at Texas A&M as a civil engineer and am a professor of the practice type in COSC. Constructors generally build structures designed by Architects (plus or minus 95%). That is why many construction science programs are in the same school or college as architecture. The University of Denver houses construction science in the business school. Construction is about managing process not engineering theory and calculations. Texas A&M would not have the number one construction science program if it had been housed in the college of engineering. Is A&M is just trying to move 1,000 students to engineering to hit help with the 25,000 in 2025. That is a terrible reason.

The biggest thing, regardless of what you do, visualization needs more funding and more independence from the college of architecture. The amount of times we have had to fight the college of architecture to get our needs met was ridiculous. Despite every single person in viz requesting and needing to have extended hours to Langford to complete our projects, we were repeatedly denied and rudely told to leave while we were in the midst of finals week and NEEDED

the computers to complete our assignments. The render farm is a vital resource to almost every single viz student and faculty, yet we were denied access to this need after hours (when most of us have the free time to work on our projects). And the lack of funding has forced many amazing professors to resign or retire, while the college of architecture has continued to fund older and less competent professors, without giving us the resources and funding (all of my coding classes were terrible, I can honestly say, I don't know how to code, despite taking 3 coding classes). Until the department of visualization gets more independence and funding, Texas A&M shouldn't have the right to brag about those of us who made it to PIXAR, Dreamworks, etc. The amount of times we have had to fight the university to get the resources to complete our work, made it difficult to focus on the tasks at hand. If you do decide to put viz in the new "Visual and performing arts" college, please make sure that the technical and science parts of viz are kept. If anything viz needs less art and more technically minded people. And make sure there is a focus on helping us FIND A JOB afterwards. As a former student, I felt like I had absolutely no support when I came to finding a job.

---

Recommendation #1: Combine.... Agree with the need to combine compatible Arts and Sciences into one college.  
Recommendation #2: Establish a School .... Disagree. Encourage students who want these programs to attend U of Texas, not TAMU. Recommendation #3: Establish a Department of Journalism. Disagree: Journalism in America has degraded to a group of self-appointed liberals who espouse socialism and other left-wing causes. Texas A&M does not need to have any part of this anti-Americanism. Recommendation #4: Bush School .... Disagree. Another left-wing liberal school that does not coincide with Texas A&M values. Recommendation #5: Create .... Agree. A great idea! Recommendation #6: Merge .... Agree. Another great idea! Recommendation #7: Implement .... Agree, streamline the budget process. Recommendation #8: Improve research .... Agree, reorganization will be beneficial. Recommendation #9a: Reassign .... Agree, makes sense. Recommendation #9b: Refocus .... Disagree. Continue emphasis on large animal education. We have too many dog & cat vets. No to a new Small Animal Hospital. Recommendation #9c: Refocus .... Agree with relocating to the College of Engineering and .... Recommendation #9d: Consolidate .... Agree, consolidation is a very good idea.

---

Each College and Department must remain independent and focused on their professional development, as it relates to Aggie traditions and loyalties.

---

I support the creation of the College of Arts and Sciences with schools within and the overall four legged structure but am curious where Education and Human Development, College of Architecture, Mays, the Law School, and the Bush School fit into this. Please share more info on this. Consideration should be given to adjusting the structure of the College of Engineering to adopt a model similar to ASU's Fulton Schools of Engineering where departments are organized by similarities into schools within the college. I do not support the establishment of a School of Visual and Performing Arts. That is an oversaturated market in Texas and we should leave it to everyone else. At Texas A&M, arts should be hobbies to accompany STEM degrees, not full fledged degrees. If a school of arts were established though it should only be in pursuit of things similar to Visualization like video game design and production. I support the growth of the Bush School through the addition of Political Science, Economics, and International Studies departments. It just makes sense to vertically integrate those degree programs and gives students a more realistic idea of career tracks. I support the scope of the Institute of Biological Life Sciences to reduce redundancy and would encourage all programs related to biology (including Biomedical Engineering, Biological Engineering, and AGLS biology programs) to have a matrixed home here. Consideration should be given to creation of similar structures for chemistry and physics as well to eliminate redundancy, expose students to everything at the university related to those majors, and hopefully prevent major changes with the common first year programs. I do not support moving the library system into the new College of Arts and Sciences and I do not support created a department of library sciences. This is too much overhead and it would give the appearance of the libraries favoring one college when it should be outside of the colleges to serve them all. I support better integrating Texas A&M Health into the university and improving the research organization. I support eliminating the University Studies degree, not moving it. The university shouldn't kid students into thinking its a useful degree post-graduation. I support the construction of a large, new, beautiful small animal hospital. Additionally, it could be built with a courtyard or quad that includes a large Aggie themed dog park open to the community and students (as well as recovering patients) and their pets. This would allow another way for the public and former students visiting with pets to interact with the university (and would be great marketing!). The project could potentially use its art and landscaping budget to cover this cost. I support moving construction science to Engineering, potentially into a new School of the Built Environment with civil and architectural engineering. I support moving Kinesiology and the Technology Management degree.

The institution is full of "silos" that are impacting students. This is part of the deep rooted "cultural" components of the University and while identified, will be hard to change without strong commitment by the leadership and measureable metrics to advance the changes needed.

---

Well, at least they didn't hide the fact that they are just saying what apparently is the "best practice" that is being pushed in the "landscape of higher education in America." Obviously, today's "best practice" in America for higher education is sub-par and shouldn't be a gold standard for TAMU to strive for unless they enjoy the extreme mediocrity of such mundane thought processes. I think there is actually a lot of benefit from the Liberal Arts and the Sciences being separated as they really don't have much in common and are being pushed together just so that the less useful Liberal Arts has something to make it look more relevant in today's world. TAMU should be thinking of how to phase out the Liberal Arts instead of finding a way to let such a useless degree continue to be an option for naive children to fall prey and waste their money. Combining these colleges would also as the report states make it the largest in the university which shifts powers to entities that are NOT truly the meat of the organization. From the report, "This larger college structure creates a stronger advocacy for the liberal arts education at a STEM-focused university. This advocacy is a value in recruiting faculty in the arts, humanities, and social sciences which are often underrepresented at STEM-focused universities." Of course, that sounds good on the surface but doesn't tell the whole story of the reasoning of why they are underrepresented is because of the lack of value they have in the real world outside of academia. Once again, we shouldn't be artificially propping up something dead to make it look alive. In fact, I will go as far as to say that you are cheating these kids out of their money by providing them with entire degrees from the College of Liberal Arts and are directly responsible for the current student debt crises by NOT doing away with these obsolete programs earlier. I didn't see a single recommendation on the College of Engineering interestingly. As any good organization would do, get rid of the dead weight and invest in those programs that are really making a difference after school is done. Also, all departments are NOT equal in value and should NOT be paid the same.

---

There is too much overlap throughout the system. We need to shutdown the Qatar campus. What purpose does it serve? Consolidate academic groups, and dramatically reduce the overhead.

---

I am absolutely thrilled with the high level logic of creating these larger, more robust academic units, each of which will have the scale, research dollars, and position to be globally recognized in their respective fields. And if implemented correctly, they should also operate more efficiently and effectively. I also applaud some of the specific focus on Media, Journalism, and other departmental areas that our university is missing today, but desperately needs. Having said that, this realignment will not be easy, and developing and executing a very strong change plan will be imperative to its success. And given there will be a great deal of pushback in many areas, this area in particular will take a great deal of time and attention from our system and university leadership to enable the change required.

---

This is great!

---

It may not be true, but it reads like the upper administration came up with the details of the realignment long before the consulting firm was hired. If this is true, then you have a issue to deal with because I'm just a former student and I could sense it from where I sit. If it's not true, then make sure you communicate how you could have come up with all the details based on responses to general survey questions.

---

Every faculty member and his/her plan and material for instruction must be vetted for the purpose of eliminating personnel and materials that are divisive racially or politically; we fought too many wars against socialism to allow its presence in curriculum.

---

I like streamlining the various colleges. I think that will help create a more well rounded degree program. I also like bolstering the Health research. It sounds like it will help make TAMU a leader in the field.

---

It is important to strike a balance between insuring undergraduate students learn core competencies in their major but with a broad enough background so that they can think comprehensively as well as specifically. My feeling is that too often academia teaches how to know a lot about the trees but but too little about the forest. A Phd told me one time that with a BS one knows a little about a lot but with a Phd one knows a lot about a little. I believe that to be true.

---

Please realign curriculum so that all doctoral students take the College Teaching course.

---

I support the merger of some departments and colleges WITHIN the main existing colleges. Merging them all into a massive College of Liberal Arts & Sciences is absolutely a bad idea and should never happen. Keep the Liberal Arts totally away from the Core Colleges that A&M has been built successfully upon. Putting these amazing science researchers and teachers under a Liberal Arts administrator would be an unmitigated disaster. Liberal Arts academics have no basis of

understanding regarding the logical thought processes that Science and Engineering academics use daily in their thoughts and teachings. PLEASE keep Liberal Arts far away from all the Science and Engineering departments!

I disagree with combining the Liberal Arts and Science colleges. We don't need to compare ourselves to other universities just to look bigger. Let the university grow organically; if science grows faster than liberal arts... let it. I do think expanding the music and music technology area is a great idea. This area has been lacking for some time. College Station has A LOT of musical talent and the current music offerings at the University do not appropriately represent that. I completely agree with recommendation 9d.

COSC did not become number one in the world under Engineering leadership. If COSC needs to move it should go to Business. The justification for moving COSC to another College is very weak. It is like you threw it on the wall to see if it would stick. More Universities have COSC under ARCH than anything else.

MGT is wrong to recommend centralized command. That's how the Feds operate and it fails miserably. The Marine Corps taught de-centralized command and things got done much better than the other services and the feds. DEI (Division, Exclusion, & Inequity) is marxist and should be abolished from TAMU. Just teach not to discriminate and provide equal opportunity.

Seems like a lot of recommendations to expand programs. Not sure how you all will have the bandwidth to coordinate such massive recommendations.

Why would try to be like other institutions? Aggieland is built on the things that make it unique, separate and distinct from other places. Prove to me this improves student life. This just seems like a recommendation to fit us into a cookie cutter.

As a graduate from the College of Liberal Arts (BA in history, class of 2013) I am worried that combining the College of Liberal Arts with the College of Geosciences would negatively effect faculty and students. I always felt like an outsider as a Liberal Arts major, and this realignment doesn't seem to provide opportunities to grow the existing college, support faculty, and provide well rounded educational opportunities. I fully support a School for Performing Arts and believe that will draw students to the university. I think it would make more sense to add the School for Performing arts into Liberal Sciences—College of Liberal and Performing Arts.

I strongly support the removal of Construction Science and Visualization from the College of Architecture (Recommendation 9C), so that faculty/administrative effort can actually be focused on the Department of Architecture for once. BUT I would still prefer to see lots of interdisciplinary cooperation between the aforementioned departments so that all students will be better prepared for that same cooperation at the professional level.

Not sure I agree with Liberal Arts and Science under the same roof. It could limit their boundaries of thought and growth. Love the idea of Journalism. We are in great need of journalist with our core values in this country. Library is a good idea. The improved research in the biosciences is a great idea. We should be a leader in this area.

Agree. This is vitally important.

1) Regarding the recommendation of the four large units of Agrilife, Engineering, Arts and Sciences, and Health, there are a few missing. One is service to country and community, and world for that matter. Don't underemphasize what has given A&M its rich Spirit – selfless service to the military and other institutions by Aggies – because it is a crucial plan in the platform of Texas A&M strategy. So, Service is missing. Another two are Business and Law. If you tuck those two disciplines into the recommended four, you will be missing an opportunity for exponential growth in those areas in terms of stature and revenue. 2) Why in the world would you establish a department of journalism? Other schools do that well. Let them. Focus on business, engineering, sciences, agriculture, law, med/vet. It is ok to have other degree plans but a department of journalism is ridiculous. A previous A&M President de-emphasized the school of journalism and that was a wise choice. 3) Forget about forming a school of Visual and Performing Arts. Keep these degree plans organized as they are so they don't detract from the mission and vision of the University. 4) In general, the recommendations miss the mark when it comes to the Arts. It is ok to focus on classical education within reason. But, if you over emphasize it, it will detract from the pillars of what A&M is known for - engineering, vet school, business, service. Tread with caution when considering elevating the Arts to a very high stature. 4) Whatever you do with the University Studies degree, don't make it harder for someone to switch from that degree plan to a business degree plan. 5) Don't combine architecture with performing arts. You will lose architecture students and the value of the architecture degree will diminish.

Are the folks that did the MGT report aware of the football teams entrance song at Kyle Field. Laced with MF-Bombs

and the N-word? TAMU...The Great Pretender?

I think this can be beneficial if resources are spread out accordingly. I think it's smart to move certain majors to different colleges- it makes more sense. However, if this is the case new facilities or updated facilities need to take priority

I am a graduate of the College of Architecture COSC program. Only academics could come up with the idea that COSC should be part of an engineering program. If anything COSC should become more integrated into the College of Architecture. Our industry is already struggling from the disconnects between design and construction professionals. It is only through increasing collaboration that we can truly succeed and this re-alignment is a very disappointing move.

I don't understand the issue enough to have an opinion here.

I didn't fully understand the 4 focus areas (AgriLife, Engineering, etc) and what impact that has on the College of Business. Given the importance of Mays and the money it generates for the University, i would like to see that it maintains a prominent role within the University.

N/A

None

Agree with the recommendations from the report

Like

Only concern is some programs and current schools losing identity under just four academic foundations identified. Concerned about the Mays School of Business and the Bush School School of Government and Public Affairs.

I disagree with moving Construction Science out of Architecture.

I would urge you to consider excellence in addition to costs . At UC Berkeley there is a college of Chemistry in addition to Arts and Letters and Physical Sciences and Mathematical Sciences and Planetary Sciences . This focus has resulted in excellence in each of those areas . One can make a similar argument about Geosciences at TAMU and Chemistry and Physics / Astronomy . I do not support the merger into a relatively weak Liberal Arts College. Keep them separate

I agree with all of them except 6. I disagree with 6 because I feel that it will make the new school too large. Why can't these tasks happen without putting the library within a school?

133 page report on consolidation and operational efficiency improvements (more \$\$\$), nothing focused on improving student experience and time at TAMU. Product should be the best experience for students, maybe more focus should be paid to that instead of rearranging groups to save money.

very interesting. moving construction science into engineering makes sense in some ways, but many "builders" are not necessarily the type of student who would be competitive getting into the school of engineering. Maybe have a Construction Management degree in the school of Architecture or something that stays in the construction industry but is not in the school of engineering. There is a high demand for construction management, in my experience.

WTH? If SJW and/or Wokeness centric - then 100% against. Your role is education - not social engineering. Washington already has that market cornered

The centralization seems pointless and more likely to hurt than help. The suggestion that Geosciences should be paired with liberal arts is ridiculous and discredits the entire report.

Huh? What does this mean? Who put this questionnaire together??

Agree on the combination of multiple schools into a College of Arts and Sciences, based on peer institution comparisons

Not sure what this point was. But making sure the education is paramount, not research first is very underrated at the main campus. Teaching is primary. If you want to do research, only do research, don't teach.

Realigning multiple organizations never benefits every body that is absorbed. That's common sense, the primary draw will take the lions share of the funding while the others are left to fend for themselves. If you treat the institution as a business rather than a place of learning you will kill off the last bits of TAMU that still feel like TAMU. Establishing another department after combining several departments does nothing to help out. The study suggests that most Americans don't trust the media, so a full on school is the answer? Just add a course on research or deductive reasoning. TAMU isn't a business, it's an institution of learning. Failure to acknowledge that will lead to the death of TAMU culture

and make it no different than any other university in the state. If you're going to do any realignment then don't increase the cost of schooling. It's not the students fault of the institution fails to manage itself and has to reorganize. Acknowledging a mistake and taking the "hit" would do more for your relations with past, present, and future Aggies than anything else you could possibly do.

---

Combining liberal arts and physical sciences seems to be combining two disparate groups. A physics professor and a history professor have very different needs.

---

The recommendation on combining colleges is based solely on the size of similarly combined colleges at peer universities. There is a disturbing lack of information on how a single larger college provides a superior student experience than several smaller colleges. Bigger is not inherently better--any decision of this magnitude should have a detailed analysis of student experience at the forefront, not simply a size comparison.

---

The streamlined realignment strategy of a "four-legged stool" sets a clear view of purpose and place within the greater university umbrella. The College of Arts and Sciences integration seems long overdue, and general integrative properties (such as the emphasis on STEAM rather than STEM) seem poised to address some of the academic equity issues noted in the provost section. Further emphasis can be placed on research initiatives and interdisciplinary collaborations- as I feel reflects trends across modern academia. Overall I feel that realignment offers benefits to access- as far as new faculty and students being able to see their place in the university structure. There may still be some pains for specialization of certain institutions and interdisciplinary efforts worth consideration for optimal integration.

---

I do not like the idea of forming a new College of Arts and Sciences simply because other universities have that format. It's important to have an identity, a niche, something to hang your hat on. We are a STEM school at heart, and it would serve us well to make a top priority of keeping our STEM programs top of their class. If we can improve our liberal arts programs without harming other aspects of the school, sure, but trying to be all things to all people tends to leave you in no-man's land. That said, if we are hell-bent on becoming more liberal-arts focused, I agree with the recommendation of adding a Department of Journalism.

---

I completely disagree with the relocation of the Department of Construction Science to the College of Engineering. This recommendation, if adopted, will destroy the premiere construction program in the county. Making this move will have significant backlash from the construction industry. Programs of our kind in the Engineering Colleges are very different and do not address the needs of the industry. As a graduate of this program and the President/Owner of a commercial construction company, I implore TAMU not to make this move. You will extinguish our pipeline of recruiting and force our 230+ strong industry advisory council to seek other institutions for our recruiting. I have also served as President of the Construction Industry Advisory Council at TAMU and, rest assured, this recommendation will draw sharp criticism from our industry. There is no other program like ours. There is no other industry advisory board like ours. Not even close. I have also participated in ACCE accreditation' effort of other institutions and our own and my concerns are valid and can be supported with firm facts. Please remove this recommendation from the report.

---

I suggest stronger ties between all of the colleges, allowing students the opportunity to earn interdisciplinary degrees. I do not agree with the assessment that Liberal Arts should be merged with the Sciences. By combining some departments and colleges, the prevailing attitudes of one Dean would effectively kill academic diversity among many unrelated fields. My greatest concern with A&M's future would be a lack of academic freedom where a myopic political ideology prevails and thus affecting the quality of education. My experiences at A&M were greatly enhanced by not knowing a particular professor's political ideology and if I did--being in political science--and it was different from mine there was no pressure through bullying or grading. Mutual respect and the freedom to argue through logical and critical thought served all educational needs well. I would favor the political science department merger with the Bush School but academic freedom must be retained.

---

I was thrilled to read about the suggestion of moving Political Science to the Bush School and continuing to invest in the Bush School. I wish these departments were combined when I attended. I was INTS but many of my classes overlapped with both departments. I would have loved to have my degree be a part of the Bush School and sincerely hope that these are moved over.

---

No realignment needed. Keep the school focused on programs that lead to jobs.

---

I doubled in History and Political Science at A&M and hold a Masters in Museum Studies acquired decades later from the University of Leicester. I was surprised to learn that the Bush School and the Political Science Dept. had not already been merged. I thought they were already one and the same. This merger is a common sense step that expands the opportunities available to undergraduates in Poli. Sci., among the other stated benefits. The report does not appear to

address another opportunity for the University to maximize the impact on student learning of certain of its cultural institutions and their facilities. There are at least three museums on campus (Sanders Corps of Cadets Center, Neely Exhibits and the galleries at the Alumni Center, and the Bush Presidential Library and Museum) plus the Library and University galleries. The University should add both undergraduate and graduate programs in Museum Studies and Archival Science under a new College of Arts and Science. What great teaching laboratories those museums and galleries would be!

The Department of Visualization needs to be moved out of the College of Architecture. While I would argue it would benefit more from tech than from art, a college of visual arts would definitely be a step in the right direction. The fact that visualization students are practically required to go abroad on an architecture requirement is absurd and limits students in financial need. The building is also very old and doesn't have the electrical plugs to support a digital major. Please consider moving Viz out of Architecture and giving the game development program some TLC. Having basically only one staff who's been in the gaming industry is abysmal. SMU Guildhall is right there as a reference on how this program could be.

It appears that with any institution (or organization) that grows at such a rapid rate as TAMU has done over the past 25 plus years that realignment into the four major "legs" is needed. Additionally, expansion of the Bush School is so important for the security of our nation that A&M can have with such an institution.

I fully and whole-heartedly support the recommendation to establish a fully accredited Department of Journalism. The prior decision to close the department was extremely shortsighted and has put A&M at a significant disadvantage when it comes to representation in this incredibly important field. Now is the time to correct the mistake that previous administrations made.

As a former student of the Department of Journalism, and a former staff member of the Journalism Studies minor program, I wholeheartedly applaud efforts to reinstate a Department of Journalism so that future Aggies can obtain a degree in Journalism. I have found that my degree from 20 years ago prepared me well for work in a variety of positions - graphic design, academic advising, social media and consulting. Journalism is the ultimate intersection of reasoning, creativity and order. We need more people who can distill information, making it readily available for accurate comprehension. While a minor field of study is a good start, it is like going to Costco to make a meal from the samples. Let's plate up the full offerings - Aggies deserve it, and the world needs Aggie journalists.

Combining Liberal Arts and Science into a single college is the most asinine idea I have heard since Biden shut down energy flow in Texas. I will discontinue my financial support of the university if this happens and lobby to my fellow former students to do the same.

None

Please please please merge the colleges recommended in this section. I was an econ major in the liberal arts college and felt that my whole department was a forgotten addition to the university. I believe that I would have been given additional focus and resources as a student under this situation. Additionally, I believe this would have allowed me to compete better with business students given the vast resources Mays provides them. Also, love the idea of offering more majors in music and journalism.

Probably some of the strongest recommendations were in this section. College of A&S makes a lot of sense. Visualization doesn't have much to do with architecture beyond "this is the school where people can mostly, sorta, draw." Having it in an art / performing arts school makes a lot of sense. Biology leaving the college of science is very exciting. My spouse was a bio major, and one of his biggest issues was that the College of Science didn't provide all of the resources that BIMS did for pre-med students, despite his intention to go to med school. It makes a lot of sense to move a majority pre-health department (Bio) to be with BIMS and Vet Med.

it seems that many of the degree plans have become exceedingly specific, and I would like to also see graduates more well rounded.

Avoid all efforts to allow Texas A & M become a socialist hotbed shch as many universities have become.

Having worked in engineering, geosciences, policy and management for about 30 years in both local government and private consulting, I am not in agreement that "arts and ALL sciences" are in alignment. I have found that academia have been producing students (new workers) that are less STEM oriented when they are coming out of more liberal arts or softer science college. As long as the geosciences program continues to be the same degree and the degree programs are not softened, then centralizing these academic groups makes sense.

"Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences." The rationale for this recommendation is irrelevant. What do the universities with combined liberal arts and sciences offer the students and future employers? Why should TAMU care what other universities are doing? Are their academic programs better for the students? Does their employer base find this to be a good thing? Doing what you are recommending will destroy all of the organizational changes recommended so far. As for cost savings, I would like to see which administrators are going to lose their jobs and save the university money. Exactly how administrators will be off the payroll and how much money will the TAMU save the taxpayer?

Recommendation #2: Establish a School of Visual and Performing Arts with new departments in music, performing arts, and fine arts, and relocate the Department of Visualization to anchor this new school. Again, diluting the strengths of the university. How many students will enroll in these programs? How will TAMU compete with already established programs at other universities? What are the future employment prospects for graduates from these programs? What are the employment rates for other universities from these same programs? What is "local arts community" of Bryan-College Station? Recommendation #3: Establish a Department of Journalism While it is vital for citizens to have reliable information the occupation of journalist in this country has been totally subverted by the radical socialists and worse. News organizations today proudly declare their bias and defy anyone to challenge them. How does TAMU establishing a Dept. of Journalism improve the situation? Who will be the instructors? If TAMU could hire journalism instructors who are not socialists and worse, how are these new TAMU graduate journalists going to get a job without selling their soul and their country? Recommendation #9a. Reassign the University Studies degree program exclusively to the College of Arts and Sciences. Is the concept of "Build your own major" something a future employer would understand? When an employer is looking to hire a mechanical engineer and is faced with a candidate with a B.S in Arts and Sciences does that candidate have any chance of getting hired? Employers are not willing to spend time figuring out the skills candidate brings to the job. This is really a bad idea.

---

I am very concerned about the prospect of combining colleges. There must be a separate college for Liberal Arts and one for Science. That consideration of this issue was farmed out to a consultant is absurd. You have a university full of experts on academics. What was the motivation for not tapping into the expertise at hand?

---

Reorganizing departments, curriculums, colleges, libraries, etc. as outlined makes good sense. Ensure that through internal communication improvements that these groups don't become siloed.

---

Some portions of realignment seem to favor and assume expansion of performance arts. My opinion is that major expansion of fields that are current weaknesses will require substantial resources. Realignment should focus on better on existing programs with slight to moderate expectations for expansion.

---

The combining of the Colleges of Liberal Arts, Sciences, and Geosciences will strip these smaller colleges of the unique identity they have. The close knit sub-communities these colleges have fostered will suffer under the conglomerated mass of unrelated fields of study and leadership that does not directly relate to the students of each College. The College of Geosciences standing alone makes it more appealing to prospective students looking to enter a rapidly expanding field. As a stand alone college it takes on the prestige of not being bundled together with other stem majors and this will attract students and position Texas A&M to become a leader in growing fields such as GIS.

---

I agree wholeheartedly with the conclusion that Journalism is key to our society - an informed citizen will be a quality participant in their community. Increasing the number of students exposed to journalism - whether or not they major in it - will improve life for all of us. Journalistic integrity is very important and lacking in our current society. Same thing is true for the Bush school. I know a recent Bush school graduate who is serving his church internationally, and showing the world how A&M educates students to affect the world. With regard to the satellite facilities scattered around, I have seen several campuses (in Round Rock and Dallas), and I'm left wondering - what are they doing there? How are they connected to College Station? I get the idea that you offer education where the students are, but it seems to be financially wasteful and not very coordinated. There is one building next to the UTD campus and I don't even know what they do there and why they are separated from College Station. I guess it is okay if you are somehow saving money, but I am left wondering if they are part of the big picture. I agree that a small animal hospital should be built for the vet school. The vet school is probably our most important college - and maintaining a superior position in the world should be the goal.

---

I agree with most of the realignment

---

Finally! Adding back a quality school of journalism with some real teeth is a good thing. Social media programs? Broadcast programs? Video production? Hard news is dead. Let's create some Pulitzer Prize winning Aggies.

I attended Texas A&M because of the strong geoscience programs. Combining the science colleges with liberal arts cannot benefit the science programs.

---

The recommendation to merge the Bush School of Government and Public Service with the Department of Political Science is misguided and showcases a lack of understanding of either academic unit. The Bush School of Government has produced the successful programs that it has because of its separation from other units not in spite of it. The attention and training that professional, Master's-level students get at the Bush School is what makes it unique. Bush School faculty are not burdened with teaching or advising PhD or undergraduate students and instead devote time and resources to developing the public servants of tomorrow. Folding this body of students into the Bush School would leave Master's students stuck in limbo between advanced researchers who are more qualified for assistantships and other opportunities and undergraduate students who in many cases are nothing more than exploratory in their field and require considerable resources. Furthermore, the programs within the Bush School demand a practitioner-rich faculty that can only thrive within a policy school. The impact of these gems of Texas A&M would be further diluted if combined into the larger faculty units of Political Science, Economics, or International Studies—academic units whose primary goal is to produce professional political scientists or economists and the academic work of these professions. And while these units might benefit from the Bush School's resources and dedicated student body, their goals and research agendas are fundamentally different. While I share the desire to grow the impact of the Bush School, this recommendation is not the way to do so. Rather, to merge these programs would be to propose that the Bush School no longer needs to focus on what the former President, its namesake, intended and at which it has excelled—namely the training of policy students for government careers.

---

I disagree strongly with combining the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences. There are distinct nuances within each requiring Deans who can navigate the unique challenges of the departments in those colleges.

---

Don't get alienated.

---

I am incredibly troubled by the proposal to reorganize the Colleges of Liberal Arts, Sciences, and Geosciences into one college. How will funding be equitably distributed for faculty and graduate student research? The research of a history Ph.D. costs far less to fund than a biology or chemistry lab, but under this proposal, it seems safe to assume the faculty and students would be competing for the same pool of funding. This seems horrifyingly ill-conceived at face value, and seems to imply that, rather than funding and reforming the current programming (say, by opening and maintaining lines of tenure-track funding), the university has chosen to shuffle and consolidate, which will likely only accelerate the current decay of Liberal Arts programs at Texas A&M, further reducing the university to a pipeline for the Colleges of Engineering and Business to funnel students into jobs with few critical thinking or writing skills.

---

Didn't notice where the Mays School of Business fits into the 4 groups. The real issue again is how much of a voice will some of the smaller programs have if consolidated into larger groups.

---

My daughter graduated with a via degree in May of 21. Although this document says the program is top notch and coveted, she is unable to find a job in her degree field. As are most of her classmates. The job fair was a disaster and the students were unable to leverage the contacts that some in the department had with professionals in the industry. And worse than that no one in the program cares that these kids don't have jobs. The entire program was a train wreck and it says a lot that my magna cum laude graduate hasn't found a job. They failed their students completely.

---

Yes to re-establishing a journalism department! This is long overdue.

---

The recommendation to merge the Bush School of Government and Public Service with the Department of Political Science is misguided and showcases a lack of understanding of either academic unit. The Bush School of Government has produced the successful programs that it has because of its separation from other units not in spite of it. The attention and training that professional, Master's-level students get at the Bush School is what makes it unique. Bush School faculty are not burdened with teaching or advising PhD or undergraduate students and instead devote time and resources to developing the public servants of tomorrow. Folding this body of students into the Bush School would leave Master's students stuck in limbo between advanced researchers who are more qualified for assistantships and other opportunities and undergraduate students who in many cases are nothing more than exploratory in their field and require considerable resources. Furthermore, the programs within the Bush School demand a practitioner-rich faculty that can only thrive within a policy school. The impact of these gems of Texas A&M would be further diluted if combined into the larger faculty units of Political Science, Economics, or International Studies—academic units whose

primary goal is to produce professional political scientists or economists and the academic work of these professions. And while these units might benefit from the Bush School's resources and dedicated student body, their goals and research agendas are fundamentally different. While I share the desire to grow the impact of the Bush School, this recommendation is not the way to do so. Rather, to merge these programs would be to propose that the Bush School no longer needs to focus on what the former President, its namesake, intended and at which it has excelled—namely the training of policy students for government careers.

Agree with removing Depts. Construction Science + Visualization from College of Architecture.

I have no issues with realignment so long as the intent is to provide a better teaching environment for the student body

Agree with recommendations

Merging the Bush School with Political Science is an awful idea. That is not what the Bush School is intended to be, nor what Mr and Mrs Bush had in mind when they founded the school. I fully oppose this as a Bush alum.

Regarding Recommendation #1: Every other university where I have worked or attended has had a huge College of Liberal Arts or College of Arts and Sciences, so to a certain extent, I would say "be careful what you wish for." However, if the benefits of economies of scale and other aspects of merger are perceived to outweigh the detriments of an ungainly-large college, ensure that excess hierarchy is avoided and adequate communication channels from the dean's office to individual departments are developed and maintained. Smaller departments could easily feel like they have been lost in the shuffle, resulting in feelings of alienation. Regarding Recommendation #6: If the University Libraries, are integrated into a new, large college (see above), what will prevent other colleges from feeling that this college will be privileged, relative to the rest of the colleges, in future library development and resources? I do not see the other colleges being supported of this recommendation without assurances of equity.

You are proposing to joining liberal arts with real science? While art is important, it is not nearly as important as science and in no way should be considered an equal to science. I find joining them into one college is absurd. Additionally if you are creating a Dept of Journalism, perhaps the #1 rule should be to tell the TRUTH and the ENTIRE TRUTH. This is the reason people no longer believe what is told on the "news" because they are only telling us what they want us to hear.

N/A

Combining Liberal Arts and Sciences does not sound like a good combination. Science and Arts are too different.

I was happy to see the recommendation of combining Arts and Science...I made a similar recommendation at the College of Liberal Arts Advisory council a number of year ago. As a business executive who explored Engineering, Business, and International Political Science while at A&M, I believe there is a need for students to be cross trained in a number of areas. Today's students are put into very restrictive tracks with limited exposure to students from the other colleges, and I see them struggle with a Holistic approach to business. Today's business environment requires executive leaders to understand engineering, computer science, business, and liberal arts disciplines (behavioral, cultural, political, religious, and economic) to successfully navigate todays complex economic and geopolitical environment.

Agree on all points but combining college of liberal arts and college of science.

We don't need to pay these consultants to tell us "TAMU has historically been conservative and slow to change regarding diversity issues" (pg110). This is not a "threat", tradition is good. Stop focusing on skin color and focus on character. TAMU does not need to be like every other leftist college campus in this declining nation. DEI is just CRT which is cultural Marxism. DEI is a scam and is dividing us. Get rid of it.

Needed

The Bush School is a huge asset that should be more prominent at TAMU.

I completely disagree with combining Arts and Sciences. Yes, many schools do that and it completely dilutes the value of the STEM Science degrees. Even if they are smaller colleges within the University, I believe they are best maintained separately. TAMU is known as a STEM school and I do believe that focus should remain. TAMU should recognize and play to its strengths, not become something for everyone. I do agree with starting a School of Visual and Performing Arts within the Arts college. I also agree with a Journalism school within the Arts college. Institute of Biological Life

Sciences which will contain the Department of Biology and the Biomedical Sciences Program and be housed in Agrilife does not make sense to me. I believe the institute could be a good addition, but to the Science college, not agriculture.

I am a former student (Class of 2010) and an investigative journalist currently in New Orleans, La. I went to Texas A&M to go to Texas A&M. In high school, my goal was to get a journalism degree, that did not exist as a department at Texas A&M when I attended. I had to find a major that was similar to what I wanted to do professionally, that ended up being Agricultural Communications/Journalism. I know of several Aggie Journalists who would like nothing more than to see an organized Department of Journalism back at Texas A&M University. The fact that it is a single major in the Department of Communications and has declining graduation numbers shows that what the university is currently doing is simply not working. Texas A&M is an incredible institution with media resources all around it including KAMU-TV/FM, The Battalion and independent student publications. The television industry in Bryan-College Station also gives students a chance to learn while in school and have a great platform to start their careers upon graduation. The proximity of Bryan-College Station to Texas' larger media markets also sets students up for internships at large market stations. There are Aggie Journalists working around the world. We are proud of our university. But in order for there to be a legacy of Aggie Journalists, the University must address the issue in Finding #3 and Establish a Department of Journalism.

I am fascinated by the omission of Mays Business School as a main academic pillar. No objection to combining Arts and Sciences.

This is NOT General Motors, and too much centralization will stunt the growth and success of the Colleges and the Univ. An air craft carrier is a lot harder to turn or stop then a motor boat.

These are the areas of focus per the study: AgriLife, Engineering, Arts and Sciences, and Texas A&M Health. What appears to be missing is the Law School. This is an essential base to promote prestige for our school. It should be foundational - on the same level as those mentioned previously.

Following Recommendation #1 (Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences) would be harmful to the individual identities of each college. The relatively smaller size of each of those colleges is a selling point. To combine all of those colleges into one would decentralize what each college does best, and detract from their unique value to the university. If I were a prospective student looking into a science major at Texas A&M and saw "College of Arts and Sciences", I would be led to believe that the college doesn't do either arts or sciences particularly well, which is why they are combined. Having individual colleges of Science, Geosciences, and Liberal Arts displays a dedication to each of those fields that is not devalued by "lumping" them together. Students at Texas A&M are told that the school has a "small town" or "family" feel, but in fact have almost 70,000 peers. Combining these individual colleges into a single, more nebulous college further detracts from the reason many people choose Texas A&M - to feel like they are seen as an individual on a "small" campus. I was in the College of Geosciences, Environmental Geoscience '18. I felt that the student-professor relationships in my college created more opportunities for learning and personalized assistance than in other courses I took. I felt like I had the ability to be an individual that my peers knew, instead of a nameless face in the College of Engineering. The personal benefit to students of knowing their classmates and professors should not be undervalued. Recommendation #2 (Establish a School of Visual and Performing Arts with new departments in music, performing arts, and fine arts, and relocate the Department of Visualization to anchor this new school) would significantly benefit the university. As a former student who participated in multiple performing arts groups/classes throughout my college experience, I always felt that performing arts was an afterthought that was mainly spearheaded by students and only a few passionate faculty members. Establishing dedicated departments for music, performing arts, and fine arts would give more of a platform for students seeking that in a school. Recommendation #3 (Establish a Department of Journalism) does make sense and would benefit the university, especially when partnered with the Mays Business School. I also strongly agree with Recommendations #4, 5, and 6.

I Love the idea of the Bush School of Government to merge with Political Science. Many of our Ags go on to become future leaders. This seems like a win win. We need more conservative voices to come out of Texas.

Stop promoting/prioritizing the jab

Very happy to see recommendation for a Dept of Journalism. Understand the need for realignment in College of Liberal Arts, as I have seen this at other institutions.

Good afternoon, [REDACTED], 2003 Liberal Arts (English Literature, Anthropology) graduate, with a comment about the proposal to merge Liberal Arts with a couple of sciences programs. I understand that this alignment (1) is common to many other large universities, (2) better reflects the intellectual history of the West in that all fields of human inquiry

and knowledge are born from the same inquisitive spirit, and (3) would save some money and headaches by merging administration and "back office" functions. HOWEVER, I believe that as we continue to see the attempted politicization of the sciences, the "hard" sciences must be kept separate from the humanities; the latter are too apt to be politically homogenous, too easily politicized, and swayed by faddish research trends (all of which I actually support!). Simply put, the humanities faculty and leadership must not be allowed to exert their influence on the sciences faculties. Try to align some of their back-office functions, I agree, but I strongly believe that the future will reward our decision to keep these faculties academically separate at A&M and to allow the scientists to be scientists and to do research and to publish without fear of their frequently more ideological peers' interference. (Not that there is anything wrong with the political homogeneity of the humanities faculties--I'm a graduate of two departments and loved every minute of it!) Yours very truly, [REDACTED] '03

I think the proposed realignments are sensible, and stabilizing - making it clear that there are 4 main colleges will be helpful. Adding more Arts in terms of both programs and facilities is a HUGE help to creating a stronger student outcome of a broad education.

Recommendation #1 is absurd. The proposed realignment is not an intelligent design. Liberal Arts and Sciences do not hold sufficient commonality to warrant the combination of colleges. The logic used in Rationale #1, positing a larger undergraduate college will result in stronger advocacy for the Liberal Arts, falls flat. While enrollment in the larger college containing Liberal Arts may increase, this value will certainly be inflated by result of combining three currently separate colleges. Instead of combining colleges with unrelated curricula, TAMU should provide more emphasis on the existing College of Liberal Arts to boost said college's reputation. Combining the College of Sciences with the College of Geosciences may be logical, as there is commonality between the two colleges. TAMU should also not take action simply because other universities do so. We must take purposeful, intelligent actions to achieve our goals, regardless of what others say or do. The remaining recommendations seem valid, except recommendations to include departments under the "new" College of Arts and Sciences. Those departments should be included in the College of Liberal Arts.

I have to say all the realignment suggestions made me so happy. I hated the fact that just because we have never had a music school or journalism department should not limit the school from growing to be the best public institution in Texas for them. An having Visualization take on a bigger role will help recruitment.

Strongly support creation of a new School of Visual and Performing Arts. This helps round out TAMU's historically lopsided focus on Science/Engineering and Ag. By the same token I also support a new Institute of Biological Life Sciences. My concern with creating a Dept. of Journalism is that it not slide into just being a petri dish for future new Fox News clones. Fact-based conservative reporting is valid, but A&M has a regrettable history of overt, extreme conservatism (not coincidentally intertwined with racism). I would hate to see A&M create the journalistic equivalent of the Federalist Society.

no comment

Function should drive realignment, just don't "lose the bubble" and make everything too vertically aligned.

Totally Agree

Please do not merge the college of arts with the college of science. Merging them would create conflict over resources and potentially lose some essential quality for either college. It is extremely important that they be independent to grow well rounded young Aggies.

I believe that the concepts of Academic realignment will provide students with direct access to more current programs. I favor the idea of STEAM instead of STEM

I am very concerned about the actions of [REDACTED]. He seems to an awful lot of time and effort with radical left wing political groups and I believe he has a negative influence on students. My son is a current student and I have instructed him to be very careful when choosing professors.

I could not find any reference to our Business School. It has been overlooked for some time and needs reinforcement. We are widely known for our engineering prowess and rightly so, but we need the balance of a robust Business School. As well as reinforcement in such areas as social psychology and social research. For example, the country is witnessing tremendous social upheaval that will result in significant change. We should have graduates prepared to understand the change and how to lead us through it.

Howdy President Banks! My name is [REDACTED] and I'm a former student class of 2017. I wanted to share my thoughts

on the idea of recommendation 2 on the academic realignment. During my time at TAMU, I changed my major from BIMS to Communication only because the "theater" major was on it's way out and I wasn't allowed to transfer into the program. Instead, I picked theater up as a minor. I, along with the other theater students around me, were eager to make art. However we were met with every obstacle imaginable with the former dean Pamela Matthews at the head of all the push back. All we wanted as students was to earn a degree in the performing arts. We wanted to taking directing, scenic design, lighting design, sound design, stage management, and acting classes among many others. We wanted to becoming actors and technicians and work in the theater with a well versed knowledge of the industry. Instead, our classes were stripped away one by one and we were essentially told that if we wanted theater then we should transfer out of Texas A&M. Many students did. However, those of us who chose to stay created our own theater companies while in undergrad. We put on performances throughout the College Station-Bryan area. We did as much as we could with as much as we had. Now, most of us are working professionals in the theater communities in Houston, Dallas, Austin and New York City. It's no surprise to me that it's recommended to reinstall this program. Texas A&M has a unique opportunity to pump out incredible talent. Wouldn't you want to showcase an Emmy, Grammy, Oscar or Tony from a former student? Texas A&M has the talent but there is no program. I'm proud to be an Aggie and it hurts for me to speak about our university with such love but have to tell prospective theater students that if they want a real theater program to look somewhere else. Bringing back a theater/drama program to the university could be one of the best moves you could make as the new president. If you have any questions or want some insight of what the fading out of the theater program was like for a student please do not hesitate to contact me. I'm available to chat at any given moment when it comes to Texas A&M at [REDACTED].

It seems an oversight to minimize the importance of the business school by dumping it into one of the 4 listed academic categories. I do not know the current ratio of graduates in the various degrees available, but the business school graduates make an outsize contribution to the school's reputation domestically and internationally.

Go back to stricter admissions policies! Use the SAT and high school transcript documentation of AP and Honors classes and GPA in addition to extracurricular and service activities. Focus on the BEST and BRIGHTEST, not using less stringent standards in all areas of academia which led to strife and division across campus as the student body became less culturally and intellectually cohesive. Stop with all the liberal arts crap. Stop turning out education degreed teachers who aren't carefully vetted for skill and intelligence. Expect all students to handle regular course loads and graduate in 4 years or less. Encourage more Aggies to return as school faculty members. Stop covid paranoia and resume all regular in person classes and interactions.

As a 1988 journalism graduate of Texas A&M, I fully support the recommendation in the Comprehensive Review to re-establish a journalism department. If adopted, journalism education would once again have the stature it deserves at A&M. I agree with [REDACTED], '86, who said: "At a time when journalism faces an existential threat, A&M can have a vital role in educating future journalists, developing new models for an industry that's essential to American democracy, and instilling that industry with the ethical standards of integrity and accuracy."

Please do not let Texas A&M become Portland State (<https://bariweiss.substack.com/p/my-university-sacrificed-ideas-for>). DEI efforts are largely political and aimed at destabilizing cultural norms in favor of "multi-culturalism." Do everything in your power to keep any DEI efforts from metastasizing into a full blown revolutionary spirit at Texas A&M. Diversity is great. There should be a diversity of viewpoints on academic campuses. DEI is not about ideological diversity in many places. Academic freedom and institutional excellence are sacrificed when DEI is made the primary ideology driving decisions and conversations on campus. Texas A&M is uniquely positioned to model academic freedom of speech and ideological diversity (unlike our rival in Austin). We exemplify the best of America. Let's keep it going.

don't combine into "College of Arts and Sciences", keep separate; is it broke?; don't establish Department of Journalism, just get rid of the degree.

Finding #1: Liberal Arts is generally undervalued at A&M. On one hand, remaining a separate college allows Liberal Arts to have more flexibility; on the other hand, it also allows Liberal Arts to remain a marginalized college. At least by combining Colleges, Liberal Arts can be advocated in conjunction with the Sciences. I think this improves the prospects for Liberal Arts. I also believe it will bolster the Sciences for the reasons mentioned in the Rationale below the Recommendation. Finding #3: I don't know much about journalism, but the disparity between A&M's graduates for that major and other universities is unacceptable. Per Rationale #3, journalism is important in today's world of mass marketing and news. Build up the Department! Finding #4: I concur greatly with the recommendation. The Bush School is too strong a program to be as unknown as it is. Merge it into the Department of Poli. Sci. and build up these programs. Until that happens, A&M's Public Policy program will never rival UT's LBJ School of Public Policy.

Realignment is concerning for two reasons. 1. Will Liberal Arts be consumed by the College of Science in order to push funding to hard sciences and even more away from what precious few worthwhile LA programs we have? 2. How will the faculty voice be consulted on this? Will they just be told to be silent?

combining the college of art with science is ridiculous. the universities they used to show that "everybody else is doing it" were not even schools that are like A&M. they didn't have UT, Rice, U of H, Colorado, Univ of Oklahoma, Texas Tech, School of Mines , etc. in their comparisons. Are we trying to dumb down the sciences or just have less administration do more work by combining schools or are the starting salary numbers for liberal arts degrees making A&M look bad on a graph

Get rid of political teachings and focus on providing students with a way to increase their value to industry and the Nation

Liberal arts is not a STEM-focused major, and as such, it should not be combined with sciences and risk diluting the success and meaning of those programs. Our school was not founded on the basis of liberal arts degrees. In addition, we do not need a school of visual arts. While the students at Texas A&M should be taught an appreciation for the arts, and I see many opportunities for the art culture to be better incorporated in the campus life and surrounding community, adding an art school would dilute the brand A&M has created through business, engineering, agriculture, and other sciences. Anyone wanting a degree in the arts should consider a liberal college, such as the UT or NYU. Removing the liberal arts and visual and performing arts portion of the realignment plan will allow for resources to be allocated to the other restructuring goals.

I agree with all recommendations except #6. I do not agree with the benefits cited of bringing university libraries under a single school - the Libraries should be in Academic Affairs, but not in a college/school.

Do not combine the College of Arts and the College of Science.

Getting rid of the journalism department was one of the worst mistakes A&M ever made and I'm thrilled to hear we are considering reviving the program

none

MAKE MASKS MANDATORY. SHOW SOME COMPASSION TOWARDS YOUR STUDENTS.

It seems like this reorg is trying to be all things to all people. Does Texas A&M really need to increase its performing arts and arts programs? I don't see a compelling rationale for that anywhere. What is truly our strategy? We will never be a Juilliard school. Why would we invest a lot of management time and money to build this?

The (re-)establishment of a journalism department is long overdue. In the 20 years since A&M shuttered its department, schools such as Texas Tech have built robust communications colleges. Today, journalism faces an existential threat as its old subscription/advertising revenue models fail. We need programs that can train a new generation of journalists while also helping to define business models for journalism itself. Most journalism research today is useless to the industry -- primarily focused on content analysis. A&M, with its focus on the real-world benefits of research, can bring to bear a broad range of expertise to help redefine the industry and position it for the new era. I was deeply involved in trying to save the A&M department in the early 2000s, and I've served on the Student Publications Board. I've also served on the National Advisory Board for Texas Tech's journalism school. In my more than 30 years in journalism, I have seen the industry's struggles first hand. I can't tell you how thrilled I am to see A&M considering this step, and I hope -- for the sake of A&M, my industry, our country and democracy -- that the recommendation is adopted.

-I am not a fan of investing in cultural centers, new school of performance and visual arts and a journalism school. I am worried about the type of student and professor that would attract to Texas A&M. The type of student who would not be interested in participating in and contributing to the Aggie traditions but instead would make A&M a political liberal campus that would find itself the scene of protesting the latest social issue rather than building up Aggie traditions. Please don't bring academic elitist thought to Texas A&M and turn A&M into a Columbia University.

Ridiculous to combine Art and Science!! Totally different sides of the brain and would not be beneficial to either student. There are already dumbed-down classes for BA students.

I don't agree with realigning and combining the Colleges of Liberal Arts, Science and Geoscience. This may add organization efficiencies, but will change the academic culture of the school. The 3 distinct Colleges are some of the best in the country and would lose their edge and focus if combined into one College. Totally agree with Recommendation #4 regarding the Bush School. The nation needs more Aggie leaders in public policy.

Do not cave into pressures to endorse or even give credence to that nonsense Critical Race Theory. Do not poison student minds with the trash. If anything, teach why this is wrong and in it's own right, racist.

---

My one and only concern I noted was recommendation 4. Do not merge the Bush School with the political science department. Doing this will anger every single Bush School alum and was not what former president George H. W. Bush would have wanted. There is a reason the Bush School has consistently climbed in program rankings, consistently attracted talented students from throughout the US like myself and all of my close friends (being from out of state), and has consistently equipped students for life in public service. Completing such a merger would diminish the unique role, opportunity, and place the Bush School has at attracting high performing undergraduate students and would be insulting to those of us who have received our degrees. I cannot express to you, anyone listening, enough how strongly I oppose such a decision. While buried deep within the report, I know myself and others who care will vehemently disagree with such a decision. Do not proceed forward with such a merger or I will debate my donations to the university.

---

I certainly agree with the recommendations concerning the expansion of the Small Animal Hospital at the College of Veterinary Medicine. However, while the report appears to focus primarily on the shortage of small animal veterinarians in Texas, many rural communities are in desperate need of food animal veterinarians. In addition, following the USDA decision to designate honey bees as food producing livestock, some thought should be given to implementing courses within the College to address the health needs of this critically endangered but highly essential insect.

---

Giving the President more authority and aligning academics to be more unified sounds great. What would the checks-and-balances be?

---

Disagree with putting Arts and sciences together. The arts program is too big already and you are just making it bigger and not better

---

I am extremely worried about the merger of the College of Liberal Arts and the College of Science. While I understand from the report that many peer institutions have done this, I do not think a direct comparison is appropriate. As A&M completes the horrendous 25 by 25 program, the College of Liberal Arts is in more danger than ever. I saw first-hand the way Liberal Arts was treated as a bottom-tier option at A&M, and with the aggressive moves by the university to bolster the engineering program, this realignment seems like a way to hide the College of Liberal Arts. Although the report claims that it will help the liberal arts programs, my experience with the University administration leads me to suspect that those programs will be left in the dark while the science programs receive new funding to provide classes for all of the engineering student rejects. Texas A&M, while a great school, has never been about competing with the school in Austin for rankings. We should be seeking students that represent our core values, respect our traditions, and intend to carry lessons they learn out into the world in support of the Aggie Network. This realignment is just another example of the little-brother mentality that every administration in the last 15 years has shared and it is destroying the intrinsic values of being an Aggie. Engineering might climb up the rankings, but what about the 300,000+ other alumni that represent the school? If the school continues moving in this direction, it will be hard for me to justify ever sending my child back to the place I love so much.

---

I was a Technology Management major (At the time it was called Interdisciplinary Studies Non-Certification - Technology Management Option), and while being under the College of Education was a head scratcher to me, I appreciated it not being under the College of Engineering as I was great with computers, terrible at Calculus, and my academic performance at the time I declared my major was not sufficient to apply to the Mays School of Business Management Information Systems degree program. Please be cognizant of this; if by moving the Technology Management degree program under Engineering Technology will require any mathematics past Calculus 1, it could potentially negatively impact the desirability of the Technology Management degree. Furthermore, as someone who has had 13 years of professional experience since obtaining my degrees from Texas A&M, I feel like Technology Management, and probably several degree programs throughout the University, would greatly benefit from more statistics courses rather than math. I have not once used the Calculus I took during my time in school, nor could I even tell you what I was taught. However, I feel like I utilize statistics every day, not only in my professional life, but in my personal life as well. Given the amount of statistics that are reported/provided to us throughout the day, statistics courses can give an individual a better chance to be a well informed citizen, in addition to being highly effective at their job.

---

Finding #1... Seems like a poor basis for this recommendation (because Michigan, Florida, and Rutgers are doing it...). The finding presents no support for its claim that this move will heighten stature. Finding #2... Good idea in principle, but where will this money come from? Finding #3... Long overdue. Agreed! Finding #4... Mixed feelings here. I went to

the Bush School and, while it does need more access, part of the elevated status of the school was precisely that it was not simply the political science department. This is huge. I would not have taken those graduate courses if it was simply the political science department. Now it would be useful to have more access to the security and international affairs elements from other programs. Finding #5... no strong feelings on this. Finding #6... Given the findings regarding the provost having too many functions, it seems odd to suggest a double merger here. Finding #7... no strong feeling on this. Finding #8... agreed. Finding #9... On university studies: why have a degree that is basically a generalist? It is almost tantamount to acknowledging that a degree only says that someone can finish the program instead of indicating any real expertise or knowledge on a subject.

---

I am very concerned about the prospect of Academic Realignment. As a proud former student of the Texas A&M College of Liberal Arts, I worry about what a merger will mean for the College and for the International Studies Department from which I earned my degree. To me, combining the three Colleges mentioned in the report will be problematic for all three Colleges. This appears to me to be another way for the university to show that it does not prioritize these colleges and the degrees that they offer. If they are combined, it will be a struggle for students to receive proper advising, among other things. Rather than this combination being a "significant cost savings" that will create "larger advocacy" for the arts at a STEM-focused school, I believe this will instead push the arts to be even less of a priority at the university. Time and time again in my years at A&M, the administration repeatedly put the needs of the College of Liberal Arts on the backburner while other major projects and goals involving engineering and other departments took priority. Combining the Colleges will make this worse, not better. By combining the colleges, the university will make it even harder for liberal arts professors and students to get the help they need from the university and to get necessary resources. Combining the colleges means that professors and students, rather than having access to more resources, will instead be forced to compete even further with others for the precious few resources the university allocates to these colleges. Further, if the goal is to "cost save," it follows that this will involve lay-offs and the non-renewal of professors contracts. Both my department and other departments in the liberal arts college that I took classes with struggled to have enough professors to teach the necessary classes as it was, and cutting funding and increasing competition for resources will not help this situation. I fear for the demise of my major to the point that it will be eliminated during this realignment, and this is something I and many others will not stand for. If Texas A&M wants to compete with the likes of the University of Texas and offer a robust College of Liberal Arts, this is not the way to do it. This is the exact opposite way to go about it and I worry that the reasons why I loved Texas A&M so much will fail to exist if the colleges are combined and my major is eliminated.

---

Reach out knowledge besides on campus. I praised the co- op program.

---

The College of Science should not be combined with Liberal Arts. That doesn't even logically make sense. That combo would diminish each college's recognition and uniqueness.

---

The addition of a Fine Arts program and Library Sciences program is an incredible idea. Both are areas that I would've loved to study at a higher level in my time at A&M, but didn't have access. I've since moved on to graduate studies at other universities in the SEC that offer Library Sciences for my profession, but would be very interested in a PhD program developed at A&M.

---

While many of the recommendations in this section seem positive, there are two that stand out and one clearly missing. I feel strongly that creating a School of Visual and Performing Arts as well as funding a Department of Journalism does not further the core mission of Texas A&M nor does it benefit our state or country in any appreciable way. There are many other universities who have a rich heritage in these two areas. Our heritage and contribution is overwhelmingly in Engineering. Aggie engineers have a global impact and yet we are not keeping up with the demand. A recommendation to increase investment in the college of Engineering, and especially in Computer Science and Engineering would have a much great impact on Texas and the world. These programs are growing rapidly in enrollment and even faster in demand, and are seriously underfunded in terms of faculty salaries and teaching positions. Why on earth would we establish another also-ran school of arts when we are underfunded in a flagship program? Makes no sense to me.

---

Requires complete transformation with focus on building better students and future competitive employees. UT McCombs and Liberal Arts has much better programs and the jobs go to UT grads, not A&M grads: much better academic programs, 100% better placement programs. Lack of leadership training, excessive focus on concepts not relevant in the market.

---

Making a college bigger, to simply make it bigger, and thus LESS RESPONSIVE and LESS EFFECTIVE is simply the same asinine logic of making the College of Engineering as big as possible without providing proper support and devaluing the

University as a whole to outside eyes. A Journalism Department and a Fine Arts College are both welcome additions. (We use to have a Journalism degree back when I was in school...)

---

May I suggest the input that the geosciences career fair invites companies that are actually hiring? I am at a loss as to why the Geology and Geophysics department believes it is acceptable to hold an already sparse career fair with numerous companies that aren't hiring. That is like going to a restaurant that doesn't serve food. I believe this is emblematic of the department in general, little to no focus on career prospects. My impression is that the department teaches the same recycled curriculum from last century while believing the false premise that an oil company will pick up the slack and hire graduates for the sole reason of having a degree from TAMU. I understand if this was true in the past but times have changed and this is no longer the case. As you can see from the drastic declines in Geology and Geophysics enrollment at TAMU, people are starting to realize that a geoscience degree mostly qualifies you to be a fry cook at Arby's. Regards, [REDACTED] Class of 2014

---

I am in strong agreement with Recommendation #9d: Consolidate the Department of Health and Kinesiology in the School of Public Health, including clinical research associated with the Department of Health and Kinesiology. When I was an undergraduate student, I was very active in leadership within the CEHD. For years, students in the college have expressed concerns that HLKN doesn't really "fit." We tried our best to promote a shared mission/vision/set of values, but ultimately I feel that realignment is our best step forward.

---

I agree with Recommendation #1 - The merge could create more synergy and resources for the college as a whole. I also greatly support #6 to elevate and support the Libraries.

---

I'm College of Engineering, so lack sufficient knowledge to comment on most. I was, however, on the yearbook staff and am wholly in favor of establishing a Department of Journalism. Wholly in favor of actions to support the Texas A&M Libraries.

---

Good move to enhance and strengthen the Visualization Department.

---

no comments

---

More focused degree curriculum without the burden of elective requirements. Please see my comments above.

---

Four academic divisions does not seem like enough. Texas A&M has several best in class colleges and hiding them inside 4 divisions does not see like the smartest decision. These colleges should be celebrated and highlighted. Which would encourage more students to attend, attract research dollars, and encourage businesses to hire graduates. Where does the College of Business fit into the 4 divisions, or the College of Veterinary Sciences? Maybe 7 or 8 divisions makes more sense than just 4.

---

It is exciting to see the proposal for a Department of Journalism. In high school, I participated in Academic UIL and placed in State for Feature and Op-Ed writing. Because of this, I was awarded a scholarship to attend Blinn College for my first year of college and eventually, graduated from Texas A&M University. Although I was passionate and talented at journalism, I did not continue my studies or career in journalism due to the lack of focus on journalism at Texas A&M. I wish there was further consideration and a proposal to re-organize the Department of Parks & Recreation. I was a Community Development major, which to my understanding, is no longer a major at Texas A&M. I always felt it was a neglected major and had few opportunities to participate in Urban Planning-related courses. I feel it is a powerful, impactful, and well-desired major, but not accurately classified or resourced. I believe this major should have been within the Department of Urban Planning. Without this major, many prospective students will choose to go to the PNW to pursue careers in community development.

---

I strongly disagree with most of these recommendations, especially the ones creating a college of arts and sciences, college of visual, performing, and fine arts, and college of journalism. These will destroy A&M's reputation of being a serious stem university and are in direct conflict and contradiction to all the goals and thresholds to recruit students to the stem fields such as engineering. A&M is not UNT or tu or any other comparable liberal arts school.

---

## Academic Realignment - Other

Please provide your comments related to Academic Realignment:

Please do not combine Geo Sciences and Science into the Liberal Arts college. There is nothing wrong with TAMU not being known as a Liberal Arts standout. There are plenty of those institutions all throughout the country. We need to concentrate on the strengths of STEM. Institute of Biological Life Sciences - good idea. Until the field of journalism stops parroting what the corporate ownership dictates and returns to true (somewhat trustworthy) reporting of facts, I do not support expanding that course of study.

Very concerned about the Library and the model that was used to compare our current library system. Most concerning is the Cushing Library being considered a "Museum". Many students, former students, researchers and scholars utilize Cushing assets. This is something our organization pays fees towards to have historical records and archived materials curated. We are concerned that the quality of student interactions with University librarians will be stunted by the lack of availability of staff to assist students under the proposed reorganization. Concern about how and if funds endowed to the Library may be redirected from their directed recipient and undermining student access to these assets.

N/A

Agree with recommendation 1. Agree with rec 2. Agree with rec 3. Agree with rec 4. Agree with rec 5. Agree with rec 6. Do not agree with rec 9a. Agree with rec 9b. Agree with rec 9c. Agree with rec 9d.

Recommendation #4: Invest in cultural centers, including a performing arts center, a museum and hospitality center, and campus gardens. The addition of much-needed physical spaces and programmatic offerings are long overdue, not only in expanding outreach and quality of life for faculty recruitment and community involvement, but also in enhancing the student experience. Opportunity: Enhancement of spaces for the visual and performing arts and museums should include core elements to invite and encourage student participation. These should engage the greater student population as well as those focused on expanded academic programs in the arts. Recommendation #2: Establish a School of Visual and Performing Arts with new departments in music, performing arts, and fine 25 ACADEMIC REALIGNMENT arts, and relocate the Department of Visualization to anchor this new school. The minimal academic presence of the visual and performing arts at Texas A&M has been the most obvious deficiency in A&M's status as a comprehensive university. Establishing a school with individual departments focusing on specific art forms will create new opportunities for students, researchers and arts patrons on campus and from the community. The unique strength of the Department of Visualization, with its origins as a graduate degree program in the Department of Architecture, is the balance of creativity and technology in instruction and research. The program evolved parallel to the development and implementation of computer-aided architectural design. When visualization became a separate department with its own undergraduate degree program it assumed and expanded Architecture's traditional role as the home of studio fine art. The study proposes a Department of Art and Design, begging the question of whether "traditional" studio art would be moved from Visualization. Also, would this new department also house digital design, the common denominator of visualization and architectural design since computers were introduced to the studio in the 1990s. Opportunity: To utilize Visualization's cornerstone role in the new School of Visual and Performing Arts to integrate new technologies into "traditional" arts fields as they are developed. Maintain and encourage teaching and research relationships between entertainment and environmental design. Better define the reports nomenclature, as well. Is using Theater and Drama in the departmental title redundant or does it assume theatre as performance and drama as literature? Is digital graphic art housed in Visualization or Art and Design? Recommendation #9c: Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning. The recommendation to move the Department of Construction Science from the College of Architecture emphasizes the lost opportunity, encouraged by students, former students, and the individual programs related professions to integrate the teaching programs of the built environment disciplines to reflect the multidisciplinary realities of the professional world. The success of focusing the remaining two departments on the core mission of design and planning in the built environment will depend on investments in leadership and academic talent. Reducing the size of the college by two thirds should not be accompanied by a devaluing of this smaller boutique college in influence and resources. Opportunity: to encourage the integration of teaching and research in the built environment professions as their respective departments advance in individual colleges. If "focus" equates to commitment to leadership and faculty excellence, the College of Architecture can grow in its impact on the profession and the built environment.

In-coming Freshmen (Fall of 2022) already accepted into Construction Science in the College of Architecture under top 10% rule should not be subjected to the ETAM process that is required of engineering majors. My son did a lot of research to decide if he should choose Architecture or Engineering. He spoke with both colleges and decided on Architecture over Engineering to get more design education. His older brother is in Engineering and he sees how large the college of engineering is and how difficult it is to get help, advisory assistance, etc. He likes the smaller feel of the College of Architecture. These incoming accepted freshman students should be able to continue to follow the current curriculum from which they based their decision on.

TAMU is recognized as one of the country's best universities because of the strong science programs. By combining into a College of Liberal Arts and Sciences, I am concerned that it will dilute the status of the science programs. As a parent of an undergrad student in the College of Geosciences, I am against this realignment. If anything a realignment into a larger College of Sciences would be a better option.

Combining Liberal Arts, Sciences and Geosciences has many implications for the Galveston campus' operations including the campus' curricula and faculty appointments. How would courses at the Galveston campus be aligned with the restructure? Establishing a School of Journalism or a School of Visual and Performing Arts poses similar questions. How would they align with the courses and minors that Galveston is able to offer? How might a School of Journalism align with the existing student-led campus media entities? These offer potential opportunities to enhance the academic offerings at the Galveston campus.

I understand and can agree with combining colleges to form a College of Arts and Sciences. However, I believe that putting the University Libraries in this newly formed College will create conflicts of interest, particularly where funding is concerned. For the University Libraries to serve the entire campus fairly and effectively, it must remain separate. I am in favor of a "learning commons model", although I believe the concept lacks a standard definition. The University Libraries as it now exists can accommodate such a model, and partnering with other academic departments across campus would be more feasible if the University Libraries remain separate. Creating a new LIS program at A&M is not a good idea for several reasons. I have heard the new graduates have trouble finding entry level positions, salaries are already low, and some academic libraries are hiring librarians without the LIS degree. I suspect acquiring ALA accreditation would be difficult and time-consuming – and perhaps not possible. If a Library Department is added to the College of Arts & Sciences, the University Libraries could and should remain separate. The University provides a lot of support for students with disabilities, but more support for faculty with disabilities is needed. I do not recall reading anything about this topic in the report – apologies if I missed it.

Dear President Banks, I am writing to express my serious concerns and express desire for the administration to reconsider the proposed merger of the Bush School with the Department of Political Science (Recommendation #4). I have been privileged to be a member of the Development Board (and now Advisory Board) of the Bush School for almost two decades. During that time, I have seen the Bush School grow from its infancy to its current status as one of the nation's preeminent graduate schools for students who wish to pursue careers in public service. A big reason for the school's on-going success, growth, and national recognition has been its focus – its focus on fulfilling President Bush's vision of a school dedicated to the noble profession of Public Service, which does not always equate to Political Science. One must only look at the disparate undergraduate degrees of the current "Bushies" to see that the vast majority of them are NOT Poli Sci majors – a fact that speaks to the difference between the goals of undergraduate studies and graduate programs. I believe the consolidation will dilute and diminish the current focus of the Bush School – eliminating one of its key differentiators - and will only serve to hurt it in both the short and long term. If any changes are to be considered for the Bush School, I would support the addition of a PhD program to further enhance the school's reputation and bona fides as the place to go for graduate degrees in public service. I urge you to reconsider this merger for the benefit of both programs. Respectfully, [REDACTED]

Why create an even bigger college out of large units? Benefits in cost cutting seem irrelevant to the task of teaching and research and do not help the university's mission. Please do not fall for the old consultant's line that cost savings here will make more money available there. What is broken that needs fixing? Too much emphasis on BRAND by consultants. This is not a corporation; more like a church, as the former Dean of Architecture told me long ago. Regarding the loss of college status for the University Library, all I can say is Hooray! The UL administration has treated staff terribly for a generation or more. Arbitrary and capricious leadership drove the best librarians away. Those who earned PhDs were discriminated against; those who did serious research were not rewarded. Overall incompetence deserves not one more month at the helm of a great library. We can remake our UL into a high-status workplace with high morale staff. Calling librarians Professors, Associate Professors, or Assistant Professors is a mistake. They are not trained to do research or to

teach. No PhD = no Professorship. Those librarians who do have PhDs, who add thousands of volumes to the collection, and occasionally teach in academic departments (e.g. David Chroust) were treated abominably. But I worry that your new enormous COLLEGE OF ARTS AND SCIENCES is not the right place to tuck the library. Too many experiments to try at once. Unnecessary too. Please consider floating a task force on the proper role of UL at A&M and where it would fit best. Let's define its mission for the future! I helped bring over 20,000 volumes of Slavic language materials to Evans Library. My mother was the director of [REDACTED]. We have been watching the A&M library system for over 40 years. It needs help and good leadership. Do not rush it into the new mega-college. Our library has a better Slavic collection than UT has. We have the best between Chapel Hill and UCLA. Why then did they kill the Slavic librarian position and ignore the collection? President Gates and I thought A&M library system was on a trajectory that would bring many scholars to College station. Congratulations on trying to get VIZ out of ARCHITECTURE. I was on the University Committee on the Future of Viz Arts in the 1990s. Hooray! How can I help?

---

I vote no to moving the COSC department to the Engineering department. Over crowding is a big issue at TAMU especially engineering. Not being able to get in classes, time with advisors, not enough staff in general. The move would be detrimental to the Construction Science program. Don't do it.

---

How will the current program for the 5-year Master's Program combined with the Bush School be impacted for students who have a Sociology undergrad major (one of the two tracks for the MPSA)? Will this continue to be offered or eliminated?

---

The academic realignments #1-#5 make sense in positioning the university for our next phase of academic and research excellence. It really speaks to the promise of "intellectual convergence" and the promotion of trans-disciplinary research and discovery. - Recommendation #6 really needs more close investigation. An independent and autonomous University Libraries is a central core of the academy and I would like for us to place our best thinking around this recommendation. - Recommendations #7-#8 I honestly do not have enough insight to add to the conversation. - Finding #9d. The College of Education and Human Development was mentioned as one where the lack of focus on the core mission of producing educators for the state and nation has negatively affected students and other units in the university;" "Refocus the College of Education and Human Development on the core mission of producing educators..." - - are inaccurate statements with no basis in data or fact. Data from the Texas Education Agency, 2021 reports that Texas A&M University is the #1 producer of new teachers in the State of Texas. With a #1 ranking for English language rrts teachers, #1 producer of elementary education teachers, #1 producer of mathematics teachers, #2 in social studies teacher education, #2 in health, physical education and coaching teacher production, #3 in bilingual education, and #2 in general education. Nationally, our college is ranked # 39 overall by US News and World Report with six academic programs ranked in the top 25. Educational Psychology #14, Educational Administration #15, Special Education #16, Curriculum and Instruction #21, Higher Education Administration #22 and our Secondary Teacher Education programs that partner with 7 academic colleges across campus is ranked #22. These independent National and State rankings do not come from a college that lacks focus. - Recommendation #9d. Retaining the Interdisciplinary Nature of the College of Education and Human Development The retention of the Department of Health and Kinesiology within the College of Education is essential to the strength of the College and the Department. Top Colleges of Education include Departments/Units of Kinesiology (e.g., Michigan State University, University of Connecticut, & Teachers College Columbia University) because health, movement, fitness, and health well-being are all essential to development and learning. In particular, as we grow programs in early childhood education and special education, there is critical need to integrate coursework in motor/physical development, movement, and fitness into course work for educators and therapist for young children both developing typically and with special needs. Current interventions integrate opportunities for learning and being physically active. These include policy-relevant work to enhance opportunities that reduce childhood obesity, increase active learning, enhance self-regulation, and alleviate issues that contribute to the health epidemic of preschool expulsion, particularly among children living in poverty and from non-dominant ethnicities/race. By retaining Kinesiology, the college is better situated to promote interdisciplinary teams tackling the challenging but real issues of human development and education from a combined perspective which integrates physical, cognitive, and socioemotional development. Health Education is a Matter of Educational Focus At the present moment we fail to see a compelling reason for re-alignment of the Health Education program and, upon deliberate assessment, fail to identify any value-added outcomes for our students, our faculty, our department, or for the CEHD. In order to maximize the benefits the CEHD has thus far enjoyed from housing the Health Education program among other education focused programs, and in order to continue its trajectory of excellence, we feel it is imperative the Health Education (a) remain united as a program/department, and (b) retain all our current academic programs, including

community health, allied health, school health and graduate degrees. Below is a brief rationale for why an alignment with the School of Public Health, would not be in the best interest of our students, our department, CEHD, and Texas A&M University.

**Health Education as a Learning Field of Study:** While Health Education is complementary to Public Health, it is important to note that it IS a distinct education and learning field. Health Educators and Community Health Workers are specifically identified by the Bureau of Labor Statistics (BLS) as unique occupations. If one explores “similar occupations” at the BLS website (one of the tabs on the site listed below), one will see that, among 10 other occupations listed only one falls within the realm of Public Health (Epidemiologists); 4 are occupations related to K-12 schools and higher education, and the others refer to nutritionists and social workers. Moreover, in their Occupational Outlook Handbook, BLS asserts “employment of health educators and community health workers is projected to grow 13 percent from 2014 to 2024, faster than the average for all occupations”. BLS elaborates by stating “growth will be driven by efforts to improve health outcomes and to reduce healthcare costs by TEACHING [emphasis added] people healthy habits and behaviors and explaining how to use available healthcare services”. See: <http://www.bls.gov/ooh/community-and-social-service/health-educators.htm#tab-6>

In addition to being a recognized profession by the BLS, Health Education has a rich and rigorous process for outlining the unique and specific competencies a health educator must master. In particular, the National Commission for Health Education Credentialing, Inc. (NCHEC), has outlined seven distinct Areas of Responsibilities and associated competencies and sub-competencies that underpin our health education profession. These areas serve as the basis for our field’s certifications, the Certified Health Education Specialist (CHES) and the Master Certified Health Education Specialist (MCHES) designations. See: <http://www.nche.org/responsibilities-and-competencies>

Public Health has its own distinct accreditations, the Certified Public Health (CPH) exam. The content outline for this exam emphasizes a distinct set of knowledge and skills. See: [https://www.nbphe.org/documents/CPH\\_Content\\_Outline\\_April\\_2014.pdf](https://www.nbphe.org/documents/CPH_Content_Outline_April_2014.pdf)

In sum, Health Education is its own field of inquiry and professional practice, distinct from Public Health, despite apparent similarities. Other institutions recognize these differences, and have community health programs housed in Schools of Education even though they have accredited Schools of Public Health on the same campus. See University of Alabama Birmingham (<http://www.uab.edu/education/humanstudies/>) See University of Kentucky (<https://education.uky.edu/khp/>) See University of Texas (<https://education.utexas.edu/departments/kinesiology-health-education>)

**How Health Education Can Continue to Elevate the CEHD**

The Health Education program at TAMU in the CEHD is uniquely situated, nationally. We are one of the few standalone, Ph.D. granting health education programs at a research intensive university. Thus, we are not only unique, but also currently regarded as a top-tier graduate health education program. Much effort has been put forth to position the Department of HLKN broadly, and the Health Education program, specifically, as one of the top programs in the nation. Therefore, by sustaining these efforts and remaining within the CEHD, we are positioned to make the Health Education program a national (and international) model for excellence in training Health Education researchers and practitioners. We have faculty who are: (1) successfully securing external funding; (2) publishing high quality research in top-tiered peer-reviewed outlets; (3) winning prestigious teaching and research awards (the sole recipient of the TAMU Presidential Professor for Teaching Excellence Award in the CEHD [in 2012] is a faculty member in the Health Education program); and (4) are shaping their content areas as visionaries and leaders of prestigious professional organizations. Our students, both undergraduate and graduate, continually impress community stakeholders and compete for high-profile employment upon graduation.

In summary, remaining aligned with the CEHD is the best way to recognize the unique field and contributions of health education to educate in pre-k-12 schools and communities through the life span, and also the best way to position the CEHD for continued success and ultimately continue the increase in the College’s national profile.

**Synergy and Connections Between Early Childhood Education, Community Health Education, and Education Services to our Land Grant University Community**

- According to National Coalition for Campus Child Care Centers (2015), approximately 35% of campus child care centers were under the Division of Student Affairs and 35% were under an Academic Department, while 10% were in Administration & Finance Divisions. Thus the current placement of the child care center is not unusual and the model has worked well up to this point as evidenced by all that the center has been able to do, including the exemplary new nature based playground that opened in September 2021.
- The current mission of the center is to enhance the quality of life of students, staff and faculty at TAMU through providing high quality child care. The center has proven to be a great recruiting tool in convincing families to relocate to the BCS area with the assurance that quality child care is available. The location within student affairs has meant access to important revenue streams to where each student receives a substantial discount on fees and the Association of Former students provides generous support. Moving the center can disrupt these streams which would be detrimental to everyone.
- The Becky Gates Children’s Center is critical to the mission of the College to

develop a new degree with teaching certification in early childhood through third grade. As we design this new program, aligned with new state standards and certification examinations, including the Science of Teaching Reading, we are integrating into coursework opportunities to observe and work in the center to develop skills in assessment, observation, and teaching young children and working with and leading professional educators working within early childhood programming. Engaging in these mentored opportunities is the Gold Standard in the preparation of teachers of early childhood education. • The Becky Gates Children's Center (BGCC) should be connected with CEHD. The BCGG not only provides child care, but they serve as a center for early childhood education research – both student- and teacher-levels. The leadership of BCGG is committed to practicing evidence-based instruction and care. They are also committed to engaging in research focused on early childhood intervention. If integrated into CEHD, BCGG would be poised to collaborate even more with the newly re-established Early Childhood Education program in TLAC and with the Early Childhood Special Education faculty in EPSE – on grant projects, student internships, and other activities that would symbiotically benefit the students and instructors of BCGG and of CEHD. BCGG participated in the hiring process for Early Childhood faculty; their voice and presence is valued and welcomed in CEHD. Thoughts on HLKN and the Overlap with SPH and more... Several of the points made between the overlap of certain programs between CEHD and Public Health are valid. I think that the "wet lab" basic science programs of HLKN would be better suited for SPH. However, if I have read the report correctly, I think it would be a major mistake to move over to SPH everything that is currently residing in HLKN. Careful analysis needs to be made about the substance of the programs and where they would best fit. Other Significant Considerations #1. A major misfit for SPH would be the sport management program. Sport management has been developed in CEHD over the past two+ decades to be a top #5 program in the country; it is not by any reasonable objective analysis science/health based to merit a move to SPH. It would be like trying to put a square peg in a round hole. #2. Closely related to sport management is the Center for Sport Management for Research and Education. It's research and instruction is more teaching/business related, not health/science. And the connection to education is strong #3. Another program currently in CEHD that needs to remain in there are the newly endowed Coaching Academy (related to K-12 teacher certification and coaching education and certification) and PEAP (physical education activities program, which can be the Physical Education academic and teacher certification anchor binding these programs together in a focused unit. The courses in PEAP serve all students at A&M for "recreation for credit" and also help teachers become accredited to teach it. #4. Another CEHD program ill suited for transfer is Technology Management. It is proposed that it be moved to the Department of Engineering Technology. But when you look at the courses offered in it, it is fundamentally -as the title suggests-- a management course that is wholly unrelated to the disciplines of engineering. It is a program designed to help educators and others learn about technology and how to use it in supporting the education and business. It is an alternative course program for students who need to know about technology but who do not intend to be engineers. Again, transfer of it to the College of Engineering Technology would be like a fish out of water and a number of frustrated students.

There is a lot of logic to the recommendations for realignment. I am a parent of 2 Aggies, but have a HS student applying this year. It has been very confusing because the program she is interested in is offered in 3 different colleges. Tech Mgt is the most baffling. It really does not seem to fit where it is. That college also does not seem to know much about the major/field. It makes a lot of sense to move it to Engineering Technology. The possibility of adding an Arts College is very exciting. For my kids, the lack of a music program was the biggest negative at A&M. It also seems like the people we know that have dropped Visualization is because it is less art oriented than they expected or is at other schools.

n/c

VizLab, while near and dear to me, shouldn't be in Architecture, so moving it makes a lot of sense.

As a parent of 2 current college students, and 1 senior in high school, I've studied and visited many universities over the past 4 years, and I saw first-hand what was stated regarding Michigan, Rutgers, and Florida, so I understand the rationale. The issues I have with it are that all of the above referenced universities have Biology and Computer Science housed within the College of Art and Science; however, this proposal removes Biology and doesn't consider Computer Science. I'm not talking Computer Engineering, that is and should be related to Electrical Engineering, after all, it's in the title. However, Computer Science is a science and should be in the College of Science. Biology is a science and should also be in the College of Science. I understand the draw to move it because of the college of Ag, but it's a science and should stay.

I really do not like the proposed consolidation involving the College of Geosciences. It takes away both the uniqueness

of Texas A&M and potentially dilutes the student experience and outcomes.

---

It is my position as a Landscape Architecture graduate that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

I vehemently disagree with the idea of moving the Construction Science degree plan/department under the College of Engineering. The Engineering department is strained as it is and by grouping construction science under the same department, you'll be adding more work with less support and resources. This move will force current professors that teach CoSci classes out of a job because of the additional credentials required to teach under the engineering program. Please reconsider and keep construction science under the College of Architecture.

---

none

---

Keep Arts and Sciences separate rather than a giant combined college. Our student chose TAMU based on the small size of the College of Geosciences which is allowing her to land a student research assistantship, great interactions with her professors and Geosciences staff. Geosciences has its own identity which will be diluted if combined into a large college.

---

Visualization is a hallmark program and the additions to the tech side of the arts is a wonderful suggestion however please maintain the option for BSc and MSc options as this is one of the unique aspects of the Viz program and attracts a unique breed of student

---

Thank you for the opportunity to provide feedback on the comprehensive review report prepared by MCT Consulting and M+CG. As a founding member of the Construction Science Industry Advisory Council (CIAC), Bartlett Cocke General Contractors has continuously supported and been involved with the Department since its inception in 1998-1999. We help the Department by providing input into the curriculum, providing student internships and faculty industry residency opportunities, funding of several endowed scholarships, and judging Capstone projects. In fact, 70-80% of our new college graduate employees come from the Construction Science Department at Texas A&M. Recommendation #9c: Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning and specifically with moving the COSC Department to the College of Engineering is of concern as it could prove detrimental to the Construction Science Program and building construction industry. Specific areas of concern include:

- Loss of interdisciplinary collaboration with architecture students – the majority of COSC graduates work in the vertical building industries where projects are led by architects and not by Civil, Mechanical or Electrical Engineers.
- Potential impact to the type and character of students we recruit – if admission requirements for COSC students are aligned with engineering students, there is a possibility that we may lose “blue collar,” “1st generation,” and “make it happen” students.
- CIAC’s influence may be scaled back. For the last two plus decades, the CIAC has provided input to the Department to adapt and adjust to the ever-changing environment of our industry. The College of Architecture has welcomed and encouraged CIAC’s influence on the Department, while some universities with Construction Science Departments located within the College of Engineering have strictly limited the involvement of CIAC.
- The CIAC and its members support the Department with financial contributions each year that may be re-directed in the College of Engineering.
- Impact to the faculty – Many of the best Construction Science faculty members are former industry members who do not hold Doctoral Degrees. There is concern that the College of Engineering may modify faculty requirements to have a higher academic tenure and focus more on research capabilities rather than extensive industry experience.
- The Program is accredited by the American Council for Construction Education (ACCE) that requires a diverse curriculum of engineering and business versus ABET requirements with extensive engineering design, sciences and math. There is a concern that the College of Engineering may push to move the accreditation from ACCE to ABET for convenience and it will not necessarily improve the Program.

Thank you again for the opportunity to provide our feedback and we look forward to hearing the final results and decisions concerning the academic realignment.

---

It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding

of this connection be sought out by the University and its consultants before moving on any recommendation.

---

Support Department of Journalism. Support Bush School expansion.

---

I am a graduate of the TAMU Engineering Technology program and a founding member of the Construction Science Industry Advisory Council (CIAC). My employer, [REDACTED] has continuously supported and been involved with the Department since its inception in 1998-1999. We help the Department by providing input into the curriculum, providing student internships and faculty industry residency opportunities, funding of several endowed scholarships, and judging Capstone projects. In fact, 70-80% of our new college graduate employees come from the Construction Science Department at Texas A&M. Recommendation #9c: Refocus the College of Architecture on the core mission of Architecture and Landscape Architecture/Urban Planning and specifically with moving the COSC Department to the College of Engineering is of concern as it could prove detrimental to the Construction Science Program and building construction industry. Specific areas of concern include:

- Loss of interdisciplinary collaboration with architecture students – the majority of COSC graduates work in the vertical building industries where projects are led by architects and not by Civil, Mechanical or Electrical Engineers.
- Potential impact to the type and character of students we recruit – if admission requirements for COSC students are aligned with engineering students, there is a possibility that we may lose “blue collar,” “1st generation,” and “make it happen” students.
- CIAC’s influence may be scaled back. For the last two plus decades, the CIAC has provided input to the Department to adapt and adjust to the ever-changing environment of our industry. The College of Architecture has welcomed and encouraged CIAC’s influence on the Department, while some universities with Construction Science Departments located within the College of Engineering have strictly limited the involvement of CIAC.
- The CIAC and its members support the Department with financial contributions each year that may be re-directed in the College of Engineering.
- Impact to the faculty – Many of the best Construction Science faculty members are former industry members who do not hold Doctoral Degrees. There is concern that the College of Engineering may modify faculty requirements to have a higher academic tenure and focus more on research capabilities rather than extensive industry experience.
- The Program is accredited by the American Council for Construction Education (ACCE) that requires a diverse curriculum of engineering and business versus ABET accreditation requirements with extensive engineering design, sciences and math. There is a concern that the College of Engineering may push to move the accreditation from ACCE to ABET for convenience and I believe this negatively affect the program and the commercial construction industry.

Thank you again for the opportunity to provide our feedback and I look forward to hearing the final results and decisions concerning the academic realignment recommendations .

---

I believe the decision to create a College of Arts and Sciences is a good one. At every top research university I've been associated with (Michigan, NYU, Harvard, Princeton) a College of Arts and Science focused on the creation and dissemination of knowledge has been the heart and soul of the university. It has long been my hope that the humanities and social and natural sciences could be united and elevated in a similar college here at A&M. Key to the success of this endeavor is the recognition that all three of these groups have an important roll to play at a top research university. I believe the College of Liberal Arts had a crucial role to play at A&M because the disciplines that comprised it share a common purpose: explaining human behavior and exploring what it means to be human. The advance of knowledge about the natural world and technological innovation based on that knowledge are activities conducted by humans. As a result, such efforts will be inefficient and mis-directed if they are not informed by the latest research on human behavior and human consciousness. This vital research roll for the humanities and social sciences has traditionally been obscured by an emphasis that the humanities play in our teaching mission. While it is important for students to understand the historical role the humanities have played, at a research university the humanities should work hand in hand with the social sciences to expand the frontiers of knowledge about human beings. Consequently, we need a “humanities for the 21st century” that leverages recent advances in the understanding to human nature, rather than being focused exclusively on thinkers from the remote past. The impact of the natural sciences and engineering will be inhibited if this is not the case. The decision to merge the Bush School with the Department of Political Science in contrast, is surprising and, perhaps, odd. First, the report’s suggestion that there is significant overlap in the area study is at best questionable, at worst, wrong. Political science is the study of power. The Bush school trains policymakers and public servants. While it is true that policymakers and public servants wield power, so do business owners, labor union leaders, church pastors, and consulting firm employees. Political science graduate students are as likely to get jobs as data scientists or consultants as they are to enter public service. Further, the political science department has a nationally and internationally (number 13 in the world according to the most recent Shanghai rankings) recognized Ph.D. program that is built on the research productivity of its faculty and its ability train and place graduate students at top

research universities. While approximately 1/3 of the tenured faculty at the Bush School have Ph.D.'s in political science none of them have joint appointments in the political science because the kind of work they do is fundamentally different. Further, and contra the report, there is no reason to believe that a merger will result in expanded enrollment, rather, it will result in the student credit hours generated by the Political Science Department being credited to the Bush School rather than the College of Liberal Art or the proposed College of Arts and Sciences. This is an accounting decision. If there is a reason for every unit in the university to have a balanced budget (but I can't imagine why resource transfers can't occur between colleges and schools), then it might make sense for the surplus created by the political science department to be redirected in this way, but it should not be confused with an attempt to increase enrollments. It is also not clear what benefit this creates for Political Science. That said, if it serves the interest of the university that Political Science's many contributions to our university (including but not limited to a top tier Ph.D. program, the delivery of required core curriculum undergraduate classes taken by students across the university, and a rigorous and popular Bachelors of Science degree) be made within the administrative structure of the Bush School rather than the more natural location of the College of Arts and Sciences, then my faculty appears willing to do that. Our concern, however, is that we are permitted to continue to do the things we value and are excellent at: basic (as opposed to the applied work typically found in policy schools), quantitative research on political behavior and political institutions, training and placing graduate students, and teaching large numbers of graduate students how to use advanced analytical tools to evaluate the truth claims made by politicians, journalists, and other commentators on politics (including policy school faculty). We feel strongly that our ability to do these things effectively while maintaining tenure standards depends crucially on our remaining a distinct department that controls the hiring and mentoring of its own faculty, the recruitment and placement of graduate students, and the development and delivery of its own curriculum. Any change that inhibits our ability to perform these core tasks will threaten the stature of the most successful Ph.D. program to have ever existed in the humanities or social sciences at Texas A&M, make it difficult to attract and retain a world-class faculty, and leave those who remain dispirited and alienated. Needless, to say, this would also be a disservice to the thousands of students we currently serve. We believe maintaining this independence and performing these functions is possible in Bush School comprised of the Department of Political Science, the Department of International Affairs, and the Department of Public Service and Administration, and, hopefully, the Department of Economics as long as the leadership of the Bush School recognizes and rewards the distinct mission and contributions of the Departments of Political Science and Economics. Any attempt to blur the distinction between what these separate departments do will lead to a rapid diminution in the quality of the political science faculty.

---

As a parent of a College of Geoscience graduate, a college of Engineering upcoming graduate and an entering freshman in the college of education and human development, I witnessed how different the experience was for each student. The smaller college within the larger university allows development of personal relationships and a sense of community within the larger community. This is an advantage Texas A&M has over other large universities.

---

I strongly believe that college of Geosciences should stay independent and that Arts and Science should also be separate. Lumping these 3 together makes no sense.

---

Recommendation #6: Merge the University Libraries into the newly created College of Arts and Sciences and create a new Department of Library Sciences. As the [REDACTED], I want to provide the following feedback and information about the Libraries which was missing in the report: TAMU Libraries ranks #18 (out of 116) in Academic Research Libraries (ARL); #8 in public academic libraries. The University Libraries is an academic, interdisciplinary college, consisting of six libraries, 85 faculty librarians, 150+ staff, and 180+ student workers, who work with every department and college on campus. The University Press which reports to the University Libraries is also interdisciplinary in their publications, creating a perfect partnership that reflects the organizational structure of an increasing number of university presses that are located under libraries. We have faculty librarians who have specialized knowledge, education, and experience for each discipline represented on campus. These faculty provide inclusive services to all 73,000+ students and 10,000+ faculty and staff on campus in addition to Canyon, HSC Houston, Kingsville, McAllen, Round Rock, and Temple. All of our peer institutions (20), as well as Tier Research 1 universities (131), ARL (116), and most land-grant distinction universities (85) have a centralized library with a dean or university librarian/vice provost who reports directly to the Provost. The report emphasizes that the mission of the provost is the leader of academic excellence. The Libraries is a leader and contributor to academic excellence in every service, initiative, and program that we offer. Three examples: (1) The University Libraries faculty developed a program to advance the adoption, adaptation, and creation of Open Educational Resources (OERs) on campus to enhance student access to higher education and student academic success. To date, the University Libraries have supported faculty use of OERs in

11 courses at Texas A&M that have served over 45,000 students and contributed to over 2.2 million dollars in student savings. In the fall semester of 2021, we reached a new milestone with 10,000 students enrolled in OER-enhanced courses. Our collaboration with the Provost's Office EDGE program has directly improved student success in important gatekeeper courses. (2) University Libraries faculty contribute to graduate education success in both classroom and extracurricular settings including providing the technology and support so that electronic theses and dissertations (ETDs) are discoverable, accessible, and preserved. Our institutional repository curates 44752 ETDs and 2130 Undergraduate Research Capstone Reports that have been accessed more than 2.1 million times by people around the world. (3) In FY19 (services in FY20 were affected by COVID), the University Libraries provided approximately 97,000 reference questions and research consultations. The Libraries is committed to the academic excellence mission. I am interested in working with the Provost office and the University Administration to continue to expand the Libraries role in this mission and to serve the entire campus community. The University Libraries is a champion for information literacy and appreciate that this was identified within the report. Undergraduate and professional program requirements are laid out very carefully throughout the campus departments and there is little to no room to add a course that would be seen as an elective. To be effective and impactful, the information literacy courses need to be embedded into the major's curriculum. The Libraries have discipline-specific librarians with expertise on how to embed discipline-specific information literacy and research methodology course needs within any degree program on campus. This model would be highly effective towards student success. We currently average over 800 information literacy sessions a year to almost 18,000 students. We have had success with this on a small scale (including the medical sciences profession programs) but we would like to engage with University Administration on how to continue this growth as fully adapting this model will require additional faculty for the libraries due to the growing number of students on campus. The Libraries actively seek out partnerships with departments and organizations on campus to lead and contribute to the academic success of students and faculty research. The Writing Center, with offices located in two of our library locations, has been a long-standing partner. In addition to providing their services within our spaces, we actively collaborate to provide joint outreach and instructional programming. We have partnered with over 40 different non-college affiliated groups and departments on campus. I am very interested in identifying future partnerships with guidance from University Administration. I am interested in discussing and exploring the possibility of putting the proposed natural history museum under the University Libraries. Objects are information. The Libraries has the expertise and the understanding of how to teach about, catalog, exhibit, preserve, store, and manage these types of collections. There will be a need for providing additional resources to this and we would not be able to manage the museum with just our current personnel and budget; however, the understanding and expertise on what is needed lies within the Libraries. I think there could be exciting opportunities for putting the museum under an academic, interdisciplinary college like the libraries in terms of education, programming, student internships, and collaborations. This museum could be used to expand the academic mission of the university rather than it being just a cultural attraction. It can be both. Learning Commons models can offer positive relationships but due to space limitations in our buildings, we are unable to incorporate every group who has an interest. It is clear through our many different feedback-gathering models that students want study space in the Libraries as we are an interdisciplinary and neutral space for them to focus and learn. In the fall of 2021, our occupancy count for each building is higher than we have ever seen and we currently do not have enough space to meet the student demand let alone carve out space for a learning commons. A total of 800,591 users have visited our library buildings between August 30 and November 1, 2021. We typically see consistent numbers of daily occupancy between 2,700 and 12,000 in our buildings. The Libraries has many ideas for collaborative spaces focusing on student success including an interdisciplinary incubator space similar to the University of Minnesota. The Libraries has proposed several different building requests over the past decade to the previous University Administration only to be told it was not a priority. I am excited to see learning spaces in the report and would like to engage further with University Administration on how we can continue to support student needs and spaces. The University Libraries is interdisciplinary and that is core to our mission. By moving a centralized library under the proposed College of Arts and Sciences, it would appear that the University Libraries is only supporting the College of Arts and Sciences. This placement could cause issues with resource allocation, meeting the information literacy needs of each department, disengagement with non-College of Arts and Sciences faculty, and, more importantly, accreditation. Each accreditation body requires a statement on the resources provided by the Libraries. We provided library support letters as well as ensured that our resources, initiatives, and programming are tailored to accommodate the needs for new degree programs. Since 2015, we have covered the needs of 36 new degree programs from each college on campus as well as TAMU Galveston and The Bush School of Government and Public Services programs in Washington D.C. We

have also provided resources and narratives to ensure that accreditation needs are met by the libraries. We contributed narratives for SACSCOC, ICU, AVMA, LCME, ABET, CCNE, CEPH, to name a few. The Libraries interdisciplinary resources include 1,026 paid databases, 5,993,280 print volumes and ebooks, and 280,292 print and ejournal titles. The AAUP and ACRL (Association of College & Research Libraries) have created a joint statement that supports the role of librarians as faculty without the requirement to teach credit-bearing courses. The University Libraries faculty are information experts, professionals, and scholars who specialize in the teaching, learning, research, discovery, preservation, curation, creation, scholarship, acquisitions, and management of information in every form available through print and digital means. A 2012 study of publication patterns of U.S. Academic Librarians and Libraries reported that TAMU Libraries faculty members ranked #3 in research and publication output. Libraries faculty aim to serve all 73,000+ students and 10,000+ faculty and staff. Over the course of FY18-FY21, the faculty librarians taught (via various forms) over 137,595 students in 4,000 instruction sessions. We have a total of 85 faculty members in the Libraries in various roles and specializations. Delegating our faculty to one department whose primary function is to create degree programs with an information science emphasis would significantly impact our ability as faculty librarians to support the university's core research and teaching mission by way of all the other programs, initiatives, and services we currently provide to students, faculty, and staff. University of Texas' School of Information or ISchool was founded in 1948 and currently ranks as #5 in U.S. News Best Library and Information Studies Programs. Last week, the Dean of the ISchool stated that their fall 2021 semester enrollment is just over 170 students, masters students and just over 12 PhD students. This is after 73 years of the school's existence. It is hard to understand justifying the effectiveness of moving any of the University Libraries 85 faculty who are impacting over 83,000 individuals at just the College Station campus through teaching, outreach, programs, and initiatives to teach credit-bearing courses to less than 200 students. In addition to the UT program (which they are developing an undergraduate major in information science as well), there are 2 other ALA (American Librarian Association) accredited library and information schools in the state of Texas which provide master's degrees. There is one non-ALA accredited online master's degree focusing on school librarianship at Sam Houston State University. Texas Tech University recently tried to create a school of information but eventually scrapped the plans. Most of our initiatives and programs are innovations of our faculty. These faculty create, collaborate, and oversee the program operations. Pivoting their focus to teaching credit-bearing courses will create significant holes in our ability to work with students and faculty; in particular, OERS, digital scholarship, data management planning, Scholars@TAMU, the digital library, copyright workshops, systematic review, in-depth reference transaction, and Get It For Me, to name a few, are resources we would struggle to offer but are highly requested and used on campus. Many faculty, staff, students, and donors have commented to me that the parts of the MGT report pertaining to the Libraries seem like afterthoughts and were most likely written without the expertise needed for a thorough assessment. One example of this is MGT only providing half of the information about the University of Oklahoma program, where the associate dean for the information science program reports through the Dean of Arts and Sciences; however, the Libraries reports through a Dean who then reports to the Provost. This organization is standard for universities with library science programs - the library has its own set of faculty and the library science program has a separate set of faculty because these are separate entities with different missions. The report states that moving the Libraries under the College of Arts and Sciences would provide an academic department home. The University Libraries is an exceptional academic home for our faculty librarians. Our organization provides the support, common understanding of each other's work, and a singular mission and vision that places us as an indispensable hub of learning, research, and creation. There is no other college or department on campus that operates like the University Libraries or provides the level of internal and external collaborations to support the university's mission and strategic initiatives. This organizational culture is critical in understanding the requirements for the promotion and tenure of our faculty. The University Libraries has been working on a new strategic plan. We have identified three primary strategic priorities that I believe are reflected in the MGT report and TAMU values: Advance Student Success, Partner in Innovative Research, Cultivate a Dynamic Library Organization. As the Libraries continue to finalize our strategic planning, we are also starting the foundation for a space strategic plan. As part of the space planning, we are creating Building Modeling Plans for the Libraries that we hope to be used as an example of recording, curating, and utilizing facility related data in an innovative way. These plans will also allow us to assess and review our library spaces with user needs as the top priority. The Libraries has an understanding of what University Administration values in the larger organization and mission of TAMU. Using the two University Libraries strategic plans and using the MGT report, I suggest that rather than moving forward with the MGT report recommendations for the Libraries, that the Libraries contract with a consulting firm that specializes in library assessment and planning. Together, the Libraries and the University Administration can work to continue supporting the

academic excellence of our students and the research needs of our faculty.

Finding #5 To begin, I feel as though much of the thought on realignment of the department of Biology is problematic. I have many issues with how the reported “underperformance” and other metrics were determined, seeing as there is no data provided, but I feel as though others have made that point known. From the perspective of a first year biology PhD, I have two main arguments. 1. Recruitment The department of biology here at TAMU, both at the undergraduate and research level are both excellent in terms of performance and outreach. To put this simply, I would have been significantly less likely to join a department where biology is considered to be in the college of Agriculture, both in my undergraduate and graduate searches. My undergraduate degree was in Molecular Biology and Biochemistry from the college of Arts and Sciences, which felt right. Arts and sciences are combined by their aim at the ideal of knowledge, not at the level of application. Combining biology with agriculture would weaken the image of the department and our chances of recruitment at all levels by associating a high ideals science with application based science. 2. Scientific Environment The department of Biology, as it stands, is a fantastic tool to bring about diverse knowledge. As it stands, we receive seminars and work with fellow researchers/professors that range from microbiology to circadian clocks to animal migration, all higher ideal sciences, which allow each person to expand themselves as an individual of science. At the undergraduate level, there is a high level of expectation for the students, a level that the department places on their students exceeding that of BMS and other biology adjacent departments. By altering this, especially by combining these, we are effectively diluting the quality of education received and the harming the scientific environment. These changes are unlikely to provide any major benefit to the learning environment, and have the potential to severely impact the way this department is viewed by external organizations, such as grad schools, medical schools, and positions in academia and industry. I hope to have made a cogent argument above. I have enjoyed my short time in this department and see it as the best scientific environment I have had the pleasure to be a part of. I ask of you to consider the arguments of myself and my peers, allowing these to guide you into making the logical choice. Best, [REDACTED]

As a high school senior I ultimately decided not to attend TAMU (even though I was admitted) because of the lack of journalism program (in 2007). I think adding that department would be a vital addition to TAMU's portfolio.

1) suggest we ( the greater ‘we’ ) remind ourselves of A&M’s mission as a Land Grant institution. 2) recognizing A&M as a Land Grant institution i question the focus on growing the Liberal Arts/Science curriculum. IMO, the effort and financial burden to grow Liberal Arts/Science should be redirected towards what A&M’s Land Grant mission....to focus on Agriculture Science and Engineering curriculums. Unlike these two areas there are plenty of other state funded universities that fill the need for Liberal Arts/Science education. 3) while A&M has been focusing on growing ‘non Land Grant’ curriculums, we’ve lost our edge in Veterinarian sciences allowing Texas Tech to become a very active Veterinarian teaching institution....especially in the area of large animals. A&M’s vet school is becoming known as ‘Poodle U’. 4) regarding the transfer of the Construction Science Department to the College of Engineering....very disconcerting for many reasons. A&M’s Construction Science program is absolutely the leading program in the country. Most Engineering students and grads that I’ve known consider the Construction Science program ‘inferior’ to any Engineering curriculum. It is not a stretch to accept that same attitude extends to the Engineering faculty. Then there is the issue of Construction Science classes and students that are focused on the ‘non industrial’ sectors ( commercial construction, home construction, etc ) opposed to those classes and students focused on industrial sectors ( oil/gas, refineries/chemical facilities, power plants, ‘green’ programs, etc.). The element of COSCI that is focused on commercial and home building may be tied closer to the College of Architecture while the element focused on industrial sectors may be tied closer to Engineering. Either way, the feed-back i have received from many former and current COSCI students is that...a) they probably would not have entered the course had it been housed under Engineering and b) the COSCI program will most likely disappear if moved to Engineering. Another question...how will COSCI customers accept that move? I strongly suggest much more consideration, discussions, studying is required before that move is executed.

As a retired TAMU: tenured faculty member; masters program coordinator; endowed professor; research center associate director, University Grievance Committee chair, faculty senator & College of Architecture faculty senate caucus leader, I have carefully reviewed and reflected on the MGT/M+CG Comprehensive Review Final Report dated 19 October, 2021, and find its recommendations both sound and compelling. Their adoption and implementation by President Banks holds the real potential to enhance Aggie student, staff, faculty, and alumni well being.

Dear Texas A&M University President Dr. Kathy Banks, The TEXO Board of Directors respectfully submits this letter in response to Recommendation 9C (beginning on page 40) under Academic Realignment, to relocate the Department of Construction Science from the College of Architecture to the College of Engineering. TEXO is a joint chapter of

Associated General Contractors and Associated Builders and Contractors and the only joint chapter in the country. We serve over 230 construction company members in the Dallas / Fort Worth region and are one of the largest chapters in the country for both associations. Our membership is comprised of both Construction Management firms (GC's) and Subcontractors/Specialty Contractors. TEXO represents both phases of commercial construction delivery, a far broader market than typical AGC and ABC chapters who are GC only. Both groups actively pursue and hire from Texas A&M. Our members revenue in the Dallas / Fort Worth region are over \$18 billion and perform 80% of the commercial construction projects in the region. Within our membership we are proud of the quantity and quality of our A&M Construction Science graduates. Our membership, especially graduates of the A&M Construction Science program, have expressed concerns over this recommendation. Below are the three main concerns:

- Future Acquisition of Talent – The Construction Science Program currently has prominence and emphasis in the vertical construction industry. In the recent period reported by the department, over 85% of the students went to work for building construction related firms in the commercial (63%) and residential (23%) industries. If the department were moved to the College of Engineering, the building construction industry would be “competing” with a much larger variety of unrelated industries for hiring future graduates. This could place our industry in a challenging recruiting position at a time when our workforce is already diminished and strained.
- Academic Emphasis – At other universities where their construction management program is housed in engineering colleges, the curriculum is vastly different than that of what the A&M Construction Science program possesses today. Much of the curriculum in engineering colleges lack key elements that have been developed in Texas A&M's current curriculum specifically for the commercial and residential building construction industry. The Construction Industry Advisory Council (CIAC), which many of our TEXO members participate in, has played a vital role in shaping the nationally renowned program through curriculum development for over two decades.
- Interdisciplinary Collaboration with Architects – In the commercial building construction industry, architects are the primary hub for the design team. Moving the program's students out of the College of Architecture would distance them from their design partners in architecture, creating an inconsistent environment than what they will encounter as they enter the industry. This collaboration is already challenging to implement in the higher education model and would be significantly diminished if this move were implemented. We are open to discussing any of these items in further detail if needed. Please do not hesitate to contact [REDACTED]

[REDACTED] Thank you for your consideration.

I do not support the concept of the Construction Science Program moving from the Architecture to the Engineering College. Having been in the commercial construction industry now for 48 years and being the AGC Chairman of the robust AIA/AGC Joint Committee in Houston for the last 35 years, I have learned to appreciate the vast differences in cultures between the architectural and engineering industries. Engineers do not design or play a role in a complete building design, architects do. Engineer's typically do not often engage directly with prospective or actual building owners, architects do. Construction professionals typically do not engage significantly with the engineering industry but they do daily with the architectural industry. Engineers often are not trained to be the communicators that architects are. One of the architects main roles is to work with contractors and help the prospective client dream about the possibilities of what could be. Engineers typically do not engage in dreaming; they facilitate in how to design to achieve the dream created by others. Contractors and architects are best paired together as soon as possible, in college, to begin their appreciation and collaboration with each other. This early collaboration development is critical to their growth and future success of both industries and the industries they will serve. To place the Construction Science program within the Engineering College would be like trying to mix oil and water, both critical to many aspects of industry, but with different personalities, career goals, skill sets and dreams. I request the Construction Science program continue to be mated to the College of Architecture, where it belongs. Thank you.

Recommendation #9c: Refocus the College of Architecture It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation. Knowledge of Building Construction/Construction Science is an important part of being a successful designer, whether landscape architecture or architecture. When our office hires new landscape architecture graduates from TAMU, we know they have some background in the technical knowledge to

support their design ideas. Both Landscape Architecture and Architecture have moved very quickly into 3D design and soon, Virtual Reality. There is a significant creative synergy between Visualization and The College of Architecture. It is important that the Construction Sciences majors have exposure to design. A great design is lost in the field if the construction managers do not recognize design goals and know how to work with design professionals. Moving CS to Engineering vs. keeping it in the College of Architecture will cause the students to be 'engineering focused' and dilute that understanding of the importance of design and the relationship with designers that is so important in the built environment. In my experience I have seen students shift between these majors and/or take courses across majors in these other college departments. Gathering statistic on this interaction between majors and coursework within the College of Architecture seems key to recommending the realignment proposed. In your Finding #1 you speak of realignment to make stronger colleges. The suggested realignment would leave the College of Architecture with a current enrollment of around only 1000 students. This would weaken the college from the standpoint of attracting both undergraduate and graduate students as well as making it comparatively small, and with less of a voice, in terms of other colleges within the university as a whole. You propose new facilities for Visualization and the College of Architecture. It seems one facility to support these together would be a better use of funding.

As a member of the Construction Industry Advisory Council (CIAC) for almost 20 years and [REDACTED], I have a particular interest in Recommendation and Rationale #9C for relocating the Department of Construction Science to the College of Engineering. As acknowledged in the MGT report, Texas A&M's Construction Science Department is nationally recognized as a top program by the construction industry, which is congruent with the department's final report from their 2017 American Council for Construction Education (ACCE) accreditation. I personally had the privilege of representing the industry in this accreditation. The ACCE's final report noted top strengths beyond the curriculum including knowledgeable faculty and partnership with the Construction Industry Advisory Council (CIAC). One of the central purposes of the CIAC is to support and advance the Construction Science Department in teaching, service, and research, and for over 20 years the CIAC has served its purpose. The CIAC continuously works alongside faculty and students to facilitate changes to improve the construction science program. Our combined efforts have not only led to this program being ranked a top program in the nation, but also a pillar for producing both the current and next generation of leaders in the Texas construction industry. The construction industry's commitment to and investment in the program stems largely from its dependence on the Construction Science Department to provide uniquely qualified construction science graduates. The industry relies on the program to provide education in leadership, business, and distinct to this major, general commercial and residential construction knowledge and skills. The "real world" commercial and residential construction industry has a symbiotic relationship with architects and designers, and as construction becomes more complex, the importance of this business relationship and early development of mutual understanding further increases. After review of the Recommendation and Rationale #9c, it is my view that the loss of educational experience associated with a move to the College of Engineering would be very disadvantageous to students compared to a potential benefit of efficiency referenced in the report. As the [REDACTED] of the Construction Industry Advisory Council, I would be interested in being part of any conversation focused on opportunities to advance and support the Department of Construction Science for the benefit of Texas A&M and the construction industry.

You need to leave everything where it already is. Geosciences does not need to go under "Sciences" and SCIENCE DEFINITELY SHOULD NOT BE COMBINED WITH LIBERAL ARTS — Unless you're actually TRYING to devalue every science degree. Some liberal came up with this malarkey to try to add value to their innately-feeble degree. It won't do that though — it will WEAKEN EVERYONE ELSE'S DEGREES. DO NOT DO THIS UNLESS YOU WANT TO END UP SOME FOURTH-RATE SCHOOL.

What effect will this realignment have on our status as a highly ranked library?

To the professional community, the decision to realign the School of Meteorology seems irrational and potentially agenda-driven. My career and company are products of the Texas energy industry. For the past 25 years I have worked for a energy related Fortune 500 companies that rely on the intelligence and science of some of the most talented meteorologists in the country. The professional community frequently relies on the College of Geosciences for generating the best geologists, meteorologist, environmental scientists and GIS professionals. Heretofore, we have always placed TAMU graduates at the forefront of consideration along with graduates from Oklahoma, Michigan and Rutgers among others. There are limited positions and ample supply so we enjoy an esteemed stable of candidates. This decision to dilute the TAMU Meteorology major to Arts and Sciences forces us to reevaluate the placement of TAMU

candidates. We honestly do not grasp the logic of altering such a highly ranked school. We strongly encourage you to reconsider this shift which will most certainly negatively impact the integrity and reputation of the School of Atmospheric Sciences.

---

Recommendation 9C (beginning on page 40) under Academic Realignment. Recommendation to relocate the Department of Construction Science from the College of Architecture to the College of Engineering. This is NOT a good recommendation. Several areas of concern.

- Future Acquisition of Talent – The Construction Science Program currently focuses heavily to the building construction industry, as opposed to civil, highway or industrial. We understand over 85% of the students went to work for building construction related firms. WE CURRENTLY EMPLOY 32 INTERNS. If the department were moved to the College of Engineering, the building construction industry would be competing with a much larger variety of industries. This could place our industry in a challenging recruiting position at a time when our workforce is already diminished and strained.
- Academic Emphasis – Other universities where their construction management program is housed in engineering colleges, the curriculum is vastly different than that of what our program possesses today. Much of the curriculum in engineering colleges lacks key elements that have been developed in Texas A&M's current curriculum specifically for the building construction industry.
- Interdisciplinary Collaboration with Architects – In the commercial building construction industry, architects are the primary hub for the design team, not engineers. Moving our students out of the College of Architecture would distance them from students in architecture creating an inconsistent environment than what exists in our industry. This collaboration is already challenging to implement in the higher education model and would be worsened if this move were implemented. Very concerned about the recommendation.

---

I am extremely disappointed in these proposals all around because they make no academic sense whatsoever but I'll stick to how it relates to Geoscience in this case. The College of Geoscience is an incredibly well-organized system with excellent advising, programs, relationships and much more. The group who conducted this study must not know a thing about this college or would NEVER have recommended it be combined with Liberal arts. What a slap in the face to all the progress Geoscience has made over the years!!! Geoscience is 100% Technology and Science driven and is the future of our planet! A&M would completely undermine the importance of this entire program by putting it in Liberal Arts! It's almost a joke just to even think A&M would consider this. Students in this college did not choose an ARTS degree! They chose a SCIENCE degree and work hard for it every single day. If you are so concerned about your Liberal arts college, then offer more arts programs and leave the SCIENCE out of it. Another valuable point is bigger isn't always better. Look at Engineering. I hear continuous complaints about large classes, non existent advising, lack of personal relationships, lack of communication, and more. This is what you want for the College of Geoscience? You want to shove it into a larger college just so Arts can look better? My students receive some of the best advising I could hope for in Geosciences. Allison does an incredible job getting to know the students and their academic plans and I believe that is partly due to the size of the college. These students get one on one advising that I know other students can only wish for! Why take that away?

---

It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

██████████, I am writing as a representative of the media, specifically as publisher of Newsday, and as a friend and alumni of journalism at Texas A&M University. I support your proposal to direct resources to journalism through a renamed/rebranded Department of Communication and Journalism, with the long-term goal of founding a TAMU School of Communication that will house a future Department of Journalism. Your department has been an important and supportive home for journalism, collaboration with the living laboratory that is The Battalion, and the growth of the degree and training of the next generation of journalists. ██████████

I am concerned about the plan to restructure the dance departments placement within a new college on campus. While I love the idea of combining the colleges of arts and sciences, my main concern to doing this is the uniqueness of the degree program. I do not want to loose the Dance Science degree. My daughter could have attended many dance departments across the nation and chose to come to A&M for this specific degree. There are only so many offered across the nation. A dance science degree is not a normal dance degree. This degree focuses on more of a sports science based education rather than an art degree. This specific program is unique and perfect for A&M's campus. My daughter

will walk away with the knowledge of how to prevent injuries not only with herself, but her future students as well. She will not have a BA in dance, she will have a BS in science and kinesiology. If you choose to move her degree college, please do not change the degree! This department has worked hard to get this program to where it is and the reputation it has within the dance community. The science and Kinesiology within this degree is what makes it so special. Yes, I know this will not effect my daughter. She will have graduated by the time the restructuring begins, but I worry for those students behind her who wanted this type of degree that might lose this chance at attending A&M who is known for not being like every other University. I am also concerned for the other science degree plans that are proposed to move to this college as well.

---

It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

Re: Relocation of the Visualization department to the newly created College of Visual and Performing Arts. My daughter is a freshman in the Visualization department. I have concerns that while expanded art opportunities sound promising, that several of the things that attracted her to the program will also change. Specifically, the focus on technology, math, programming that results in a Bachelor of Science. I believe that the BS degree sets A&M's program apart with increased job marketing opportunities. Will existing students be grandfathered into the existing program of study? Also, she enjoys getting to participate in "big university traditions" but still having her small, selective niche.

---

The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. ---

TAMU Meteorology is ranked #2 in the nation, behind Penn State, college of earth and mineral sciences. #3 is OU Meteorology, College of Atmospheric and Geographic Science. MGT uses University of Michigan and Rutgers as examples. University of Michigan's BS meteorology is college of engineering. Rutgers BS is school of environmental and biological studies. TAMU is hurting our graduates by accepting this recommendation. MGT has recommended the opposite for the past 4 biannual reports. Downgrading Geosciences and Meteorology to college of arts and sciences contradicts TAMU's core values. Downgrading Meteorology to College of Arts and Sciences is insulting to the rigor of the program. The only acceptable restructure is to move to College of Engineering, as Univ Michigan (as MGT uses as their example).

---

Dear President Banks, The MGT Report presents exciting opportunities for Journalism. TAMU journalism in a renamed/rebranded Department of Communication & Journalism, with a longer-term goal of situating a new Department of Journalism in an eventual new School of Communication is a worthy goal. COMM is rebranding our B.A. and B.S. degrees in "Telecommunication and Media Studies" with the new name "Journalism and Media Studies," starting fall 2022. Both degrees can also be paired to a 3+2 Master's degree. Journalism degrees almost doubled in the last three years under the Department of Communication. One measure of success is the impressive number of 2020 and 2021 Associated College Press Awards garnered by our journalism students. Another is the innovative collaboration with UT's Student Media creating new revenue for A&M Student Media, which in turn gives more students more opportunities to practice their craft and make important contributions to the entire community. We welcome expanded opportunities to include journalism courses in other degrees for an educated citizenry, for paid internships with Athletics, MarComm and others for practicum areas of the degree, and for specialization in areas like health, science, and data reporting, but here I must insert a caveat. Although media is a business, journalism is not. Advertising and Editorial have always been "Church and State" and ethically they must remain so. Reporters must be free and independent to report honestly on topics, situations and people without pressure or fear of reprisal from the business side. This argues strongly for Journalism, and its outlets in The Battalion and KAMU, to stay with COMM rather than have any direct ties with, or oversight by, MarComm. The MGT Report rightly states "media literacy and communication skills are key for students to develop and implement in any career." So are the needs for science literacy and grounding in the humanities and ethics. The Department of Communication and Journalism will have greater capacities to provide such multifaceted education to our journalism students and will flow nicely into a future School of Communication and

1. Why the drastic change? It seems driven by obscure incentive. A&M is respected, as is. So why the HUGE changes? It doesn't make sense. 2. My son is Meteorology Geoscience Major. He decided on A&M because of the strong reputation of the program. Suggesting to change it to Arts and Sciences is unreasonable and absurd? 3. Rutgers Meteor is ranked #29. MGT is suggesting that our #2 program follow a #29 lead??? 4. IF you move Meteorology it should be in College of Engineering, as the degree requires massive amount of engineering courses. And many other STRONG, highly ranked and respected Meteor programs are College of Engineering Programs. 5. Construction Science is NOT engineering. Keep in Architect college. 6. MGT has consistently recommending the opposite for Meteorology the past 4 reports. 7. Is anyone making this decision watching the news about Climate Change? A&M should be leading and maintaining a strong Geoscience Meteorology program. This proposal is doing the opposite. 8. You are not being transparent for feedback. You have a LARGE click point for the report. And a small (hidden) click point for feedback.

It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

It is the position of the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation. It is my personal opinion, as a public practitioner for 20 years and now a private practitioner of over 22 years, that the link shared between Architecture, Landscape Architecture, Visual Arts, and Construction Science is logical and sensible based on the reality of everyday practices where we all work together teaming complex and successful projects. The proposed changes would only gut the effectiveness of the program that produced them and try to strengthen colleges that do not logically fit together with these departments. Politically, it seems that Visual Arts is being stolen to financially underwrite an arts program and Construction Science is being stolen to help the engineering program which currently produces many new engineers that have no sense of reality in the workplace.

As a company that typically hires 10-15 Building Construction graduates annually, I feel that making the construction department part of the engineering college is a mistake. I have been in the commercial construction business for almost 30 years and currently run an ENR top 50 commercial contracting company. As a commercial contractor, we work day in and day out with architects. The synergies learned during college only enhance that effort. We typically hire 60-80 new graduates annually from various schools across the country. Texas A&M has been our main "go to" university for recruiting. We have hired many other students with engineering degrees, but the TAMU Building construction degree, by far, produces the most well rounded students. I feel the differentiators between Texas A&M and its peers will be lost if this change is made. I would love to discuss and could give substantially more feedback outside of this format. I can be reached at [REDACTED].

My opinion on moving Construction Science Dept to the Engineering Dept. I feel moving the Construction Science Dept to the Engineering Dept will be a mistake. The move would eliminate the personal/small feel the dept has and the students strive in. They will be lost in the thousands of students in engineering. The majority of students currently in CoSci would probably not have been accepted into engineering where they could studying the field they love- construction science. After the first year of ETAM the majority of students that go into CoSci Engineering will be the students that couldn't get into the engineering major they wanted. The engineering dept will not be getting students that love/want construction science you will be getting the students whose grades didn't make the cut for their 1st or 2nd choice engineering major. I hope you consider all comments and opinions from parent and former students. Thank you for your time. [REDACTED].

It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning

and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

- Impact to curriculum – Concern that core engineering curriculum hours may take the place of current courses tailored to producing the very best well prepared construction professionals, including the right mix of finance, accounting, management, law, communications, etc.
- Loss of interdisciplinary collaboration with architecture students – the majority of COSC graduates work in the vertical building industries where projects are led by architects (not engineers).
- Impact to the type and character of students we recruit – if admission requirements for COSC students are raised to the standards for engineering students there is a possibility that we may lose “blue collar”, “1st generation” and “make it happen” students. Did you know 24% of the current COSC students are 1st generation minority students?
- CIAC’s influence may be scaled back – for many decades the CIAC has influenced the department to adapt to fit the ever changing environment of our industry. The College of Architecture has welcomed and encouraged CIAC’s influence on the department, but other universities where the construction department falls within the College of Engineering have strictly limited the involvement of a CIAC. In addition the CIAC supports the department with financial contributions each year that may be re-directed in the College of Engineering.
- Impact to the faculty – Many of the best COSC faculty members are former industry members who do not hold doctorate degrees. There is concern that the College of Engineering may steer toward faculty with academia tenure and certification rather than industry experience.

---

I am opposed to Recommendation #9c to refocus the College of Architecture by removing the Departments of Visualization and Construction Science. As a practicing landscape architect, I see everyday the value in the collaborative process of design and construction. Realigning these departments erodes the creative process of design and widens the gap between the construction industry and the design professions. Aggie construction science students benefit from the connection with the architects and landscape architects who will be their colleagues. Architecture and landscape architecture benefit from exposure to the construction industry. I disagree with rationale that these realignments will allow the College to refocus on the core mission. Graduates of the College are recognized in the industry for their pragmatic understanding of the business of construction. Realignment will be detrimental to our student's standing in the industry.

The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

It is our position as the Landscape Architecture Professional Advisory Board that the proposed Academic Realignment would weaken the College Of Architecture rather than strengthen it. The departments of Construction Science and Visualization are integral with the colleges and professions of Architecture and Landscape Architecture, Urban Planning and Interior Design. The synergy and support that each department gives the other is not readily understood by the outsider but is evident to the students and professionals of our respective trades. We ask that a deeper understanding of this connection be sought out by the University and its consultants before moving on any recommendation.

---

I am concerned that the implications of relocating the departments of Construction Science and Visualization is not understood well enough. Construction Science is, and has long been deeply integrated with Architecture and Landscape Architecture. A collaborative understanding of construction is essential to success in our design/building profession, and close association for students and faculty is an important part of developing that understanding. As a practicing landscape architect my firm deals with construction contractors every day and that affinity and understanding was founded in my experience within the College of Architecture. While I have less personal experience with the Visualization Dept. I appreciate the value of design communication and visualization for architecture and landscape architecture. This integrated resource is an important part of the College and its departure would diminish the whole. I encourage in-depth communication with the College to understand more fully the value of these two departments to the education of our students and the loss to our profession if they were to be relocated.

---

Texas A&M has a world-class engineering and agriculture program, but A&M is not a world-class university. For A&M to become a world-class university, it will need to invest in the arts. I support the move to combine the colleges into the College of Arts and Sciences. I also support the investment in key areas of the new college, especially performing arts and journalism. Even with the new investment in performing arts, some liberal arts may feel overshadowed by the sciences because sciences require much more funding for equipment and facilities. Be sure to balance the associate deans to give adequate representation to the arts and provide adequate funding for programs in the arts.

Current construction science students are very concerned that their degree plans will be changed and this will cost them valuable time and money. These students need a guarantee that their current degree plans will be honored and grandfathered in. Also if faculty from co sci is lost due to lack of PhD preparation, you are losing the faculty that has built the program to be the nationally recognized program that it is.

---

Please do not move respected majors from their respective colleges.

---

---

I think the realignment proposals are good but question why an Institute of Biological Life Sciences is recommended rather than a Department. An Institute implies a research mission which is already managed by AgriLife research.

---

"Recommendation #1: Combine the College of Liberal Arts, the College of Science, and the College of Geosciences to create a new College of Arts and Sciences." I hope that the uniqueness of the license option (MART, MARR, MARS-LO, etc) programs in Galveston does not get lost in this realignment. Bigger is not always better. Academic Advising should always be done by a professor within the department of the student's major.

---

As mentioned above, I am in favor of establishing a School of Visual and Performing Arts as this will enhance the ability of TAMU to provide a better fine arts program. I have very mixed feelings, however, about the suggestion to merge the College of Fine Arts, Geosciences, and most of Science into a large College of Arts and Sciences. Just because everyone else does it is not a particularly valid reason for such a change, and according to the report, 7 of the 19 universities cited as peer institutions do not have such a system. Several other small colleges are being left alone - Law, the Mays Business School, the Bush School, and Architecture, as well as Education (at least, none of them are mentioned in the report other to switch existing departments from one college to another enhance their stature). So why make the particular change to a College of Arts and Sciences? Will it save money? Probably not, as there will still have to be sub-deans and department heads, and there will still be a need for additional staff in positions such as advising, finance, travel, etc. (I do not believe, as apparently the consultants do, that centralizing everything will always lead to increased efficiency and cost savings!). For my own college, Geosciences, one of the advantages is that we are a self-contained college that covers all the facets of environmental science. Indeed, this is a major plus when we are trying to recruit faculty and graduate students, as shown by statements from recent new faculty interviews. The Environmental Sciences and Environmental Studies courses exist essentially because we are all together in one unit. Whether it is called a college or a school is perhaps immaterial, but submerging it in a combined College, as suggested, will remove much of the allure, as we are one of very few colleges in the country dedicated to environmental matters where one can combine oceanography, atmospheric sciences, geology and geography under one roof. We have already lost student credit hours as a result of switching from an 8-hour science requirement to a 9-hour requirement. This is because of the refusal of the university to mandate a laboratory class as part of the science requirement. If we are rolled into a larger unit, we are likely to lose more students to classes in other departments, which will count against us in the biennial reporting. Additionally, we are likely to lose out financially if we are integrated into a larger college as the Dean, or whoever is the new supremo, will likely spend more time on matters other than finding outside funding for Geosciences. It is also likely that such a change will disadvantage faculty as regards tenure and promotion, at least for the first several years, as differences in existing college standards for T&P will need to be homogenized. Since members of departmental T&P committees are not allowed to serve on college T&P committees, this gives ample scope for miscarriages of justice for tenure track and other faculty.

---

Dr, Banks, My name is [REDACTED] I am Class of '82 and graduate from the College of Engineering with degree in Engineering Technology - Civil Construction. I think that this degree is no longer available. I serve as Chairman and CEO for [REDACTED]. The report proposes to move the Construction Science Department from the College of Architecture to the College of Engineering. I do not agree with this proposed change. I am an executive member of the Construction Industry Advisory Council for Construction Science and I am a past president of the CIAC. During my tenure as president, I was able to travel to several parts of the country and visit with other colleges about their construction science programs and advisory councils. Even though I am a little biased, I feel pretty strongly we have one of the top, if not the best, Construction Science program in the country. I have several concerns with the

proposed move. 1. I think that there is a good mix of faculty presently. What I mean is that there are a number of former members of the industry along with other professors who teach these students. The industry experience that is passed on to the students is so invaluable. I am concerned with a move to the College of Engineering that these former members of our industry will not be allowed to teach. 2. I am concerned that there will be an impact to the curriculum. At the present time students these students receive a well rounded curriculum tailored to give the students a mix what they will see in the construction industry. This includes finance, law, accounting, communication, writing, etc. My concern is that more engineering type classes will be required. In my over 40 years in the industry, I have never used the calculus that I was required to take. As an industry, we are looking to hire those type of individuals that have that well rounded base. These type of individuals make our best employees. 3. We want to make sure that the voice that the industry carries in the Construction Science Department remains strong. As mentioned previously, our CIAC has helped our department in many ways. As you may know, we meet twice a year to hear what is going on in the department. We review curriculum and make suggestions on what we feel the students need in the way of construction knowledge. We also are very strong financially and give support in the form of scholarships and other ways to financially strengthen the department. Many leaders of our construction industry have been involved the CIAC over the years and will continue to do so for years to come. 4. We need to strengthen the collaboration with with College of Architecture and moving the department to the College of Engineering will more than likely weaken it. Now more than ever, there needs to be more working together with builders and architects and that has to start at the college level. It is much more difficult to build projects now that it was even 10 years ago. With limited and more unskilled labor available to build our projects, we must think through how buildings are designed and built. I see more design build projects in the future and that means that architects and contractors need to be joined at together for the common goal of building a great project for an owner. 5. We want to make sure that those first generation and make it happen type students will still have an opportunity to further their education at Texas A & M. At the present time, 24% of the current COSC are 1st generation minority students. As you know, the department has expanded to the Rio Grande Valley, to give those students an opportunity close to where they live. These are some of my thoughts. Like I previously mentioned, since I have a degree from the College of Engineering, I have seen both sides. I just feel that making the bond stronger between Architecture and Construction Science will be the best move for our construction industry. We are in a great time in our history and we need great Texas A & M builders, architects, and engineers to move forward with all the challenges we face. Thanks for what you do...

I am extremely disappointed that TAMU is realigning at the student expense the school Of meteorology. As a business leader who recruits from TAMU I was disheartens to find that everything I have known TAMU to stand for is not being considered in this decision. The students who are currently in the program should be able to complete with the degree plan they signed up for and invested in

meteorology may be the casualty of a war... "Finding #1 More than half of peer institutions house their schools of liberal arts and sciences in a combined college. TAMU houses its liberal arts and sciences in separate colleges." TAMU Meteorology is ranked #2 in the nation, behind Penn State, college of earth and mineral sciences. #3 is OU Meteorology, College of Atmospheric and Geographic Sciences. Those programs are not "watering down" the heavy science/engineering meteorology degree. MGT uses University of Michigan and Rutgers as examples. University of Michigan's BS meteorology is college of engineering. Rutgers BS is school of environmental and biological studies. So why the recommendation to "water down" TAMU Meteorology to a "college of arts and sciences"? TAMU is hurting our graduates. It's baffling. Big companies often try to influence these type of programs. Is a big Oil company (chevron?) behind this and TAMU is cowering? There must be a reason. It's very odd to combine liberal arts and science... However with climate change I would think meteorology is even more important. MGT has recommended the opposite for the past 4 biannual reports and are only recommending this now because President Banks asked them to include this in their report. Downgrading Geosciences and Meteorology to college of arts and sciences is not only laughable, it contradicts TAMU's core values. As Former Texas A&M President Dr. Robert Gates stated "EXCELLENCE stems from a great sense of pride in who we are and what we believe in." INTEGRITY-students CHOSE TAMU over other reputable programs and you have sucker punched them. LEADERSHIP-environment, helping our planet and predicting the future for our earth is the future. And Aggies should be LEADING in this venture. LOYALTY-watering down this program is shocking and abandoning students as they seek jobs and grad schools, competing with other REPUTABLE programs (bachelor of sciences and college of engineering). SELFLESS SERVANT-these students and professors have given much to the community. As a parent of a meteorology student, who carefully consider Penn state, I'm imploring you to maintain the educational excellence that drew him to TAMU. Downgrading Meteorology to College of Arts and Sciences is

insulting to the rigor of the program. The only acceptable restructure is to move to College of Engineering, as Univ Michigan (as MGT uses as their example).

The only acceptable restructure is to move to College of Engineering, as Univ Michigan (as MGT uses as their example).

I think it's a bad idea to combine the arts and science into one college. A Bachelor of Arts is vastly different than a Bachelor of Science. Combining them would be a very bad idea. This will water down the science degree and ultimately damage the reputation of a bachelor of science from TAMU.

Construction science shouldn't be combined with engineering. The engineering program is tough and it's nice to have an opportunity separate from engineering for those that seek it as a first choice or those that want out of engineering. Engineering is growing too fast. The reputation is that it's not advisable to take physics 207 at A&M because the teaching is poor and the grades are too low. That is disappointing. Also disappointing that word is to avoid math 152 for same reasons. A&M should clean up engineering and stop trying to flunk out the freshman. They should clean up physics reputation. Clean up math department. Fix chemistry. They should fix problems in engineering before making program larger with construction science.

There will always be institutions that are known for specific offerings. A&M does NOT need to be ALL things to ALL people. Liberal arts degrees who struggle to find gainful employment in their fields - feel better because they are legitimized. The market decides which degrees matter, not academics. Science degrees are watered down, because resources go to liberal arts Texas A&M needs a College of Arts and Sciences like Julliard needs an engineering department. Biology findings are accurate. Centralized academic counseling to change majors is wacko. You will have advisors who won't know or understand how to guide students. I'd concentrate on why students change majors so much - solve that, and you can save the money on centralizing academic counseling.

Find professor's that 100% believe in and whom will abide by the Aggie Honor Code, students are facing enough without professor's becoming unhinged spending classroom time on politics well outside of their syllabi.

My general impression of the academic re-alignments is positive--the consultants provided well-reasoned, fact-based arguments to back their recommendations. A more robust TAMU emphasis on the humanities/arts is wise and will serve the university's non-STEM students well. Amplifying the presence/degree programs (particularly the Ph.D. recommendation) of the Bush School provides an opportunity to put the school on a path for national relevance/competitiveness. I am much less inclined to be persuaded with the recommendation to create a School of Journalism. The consultants are correct in their analysis of the grim outlook for print journalism. But I am at a loss as to how and what the rationale for a new school will contribute to this essential challenge to civil society. There seems to be little student demand (per the #s in the report) and one wonders, will a new school change this. I don't buy the argument that a School of Journalism a solution to what they (correctly) claim in their last sentence: "To aid in the

restoration of trust in media and increase engagement rates, it is key that students and the public gain a comprehensive understanding of journalistic terms, processes, and transparency practices to become more responsible consumers and producers of journalism."

---

I like a more holistic review for admissions

---

My comments are in reference to Recommendation #2 - the establishment of a School of Visual and Performing Arts with new departments in music, performing arts and fine arts, and the relocation of the Department of Visualization to anchor this new school. Based upon my reading of this report, it seems that the current Dance Science program will be eliminated and replaced with a BA or BFA in Dance (or possibly in performing arts). I believe this would be a mistake for TAMU to do so. There is a tremendous difference between the current Dance Science (Kinesiology) degree and a BA/BFA in Dance or Performing Arts. Many of those majoring in Dance Science do not plan for a career in dance performance, but plan on a career in physical therapy or other medical careers. In many cases, they intend to concentrate their medical specialty to work with dancers which was the rationale for a dance science degree rather than some other path to their medical career. A BA/BFA in Dance would not differentiate A&M from the vast number of other colleges and universities where students could earn such a degree. The degree in Dance Science sets A&M apart from these other institutions. For these reasons, I believe it would be a drastic mistake to eliminate the current Dance Science curriculum, if that is what is being considered. Of course, if a BA/BFA in Dance is offered in addition to the Dance Science degree, that would be perfectly acceptable.

---

I have been a student in and worked in a College of Arts and Sciences Dean's Office at a different (smaller) university, I have been a student at a School in Texas A&M, and I now work at the College of Geosciences at Texas A&M. There are two primary things that struck me from the first recommendation in this section. The first was the notion that a college of arts and sciences would "heighten its stature as the home for one of the largest undergraduate curricula at TAMU." Stature and respect in academia never come from a large quantitative size (in fact the reverse is generally true...) The College of Arts and Sciences I worked at previously housed a majority of the courses and gained much of its funds and exposure from the GenEd classes that it provided for other colleges' degree programs. This did not make it prestigious; instead, the College of Arts and Sciences was the least funded and most disorganized of the entire university. There are obviously many factors that differed at my other university (it was smaller, for one), but the notion that a large college is inherently more prestigious or more well funded than a smaller college just doesn't follow logic. The second thing that struck me about this recommendation was the contrast between the need for centralization and the need for cohesion. These two things cannot be true with a college as large as the proposed Arts and Sciences at Texas A&M. Such a college would be huge, and would be spread out around numerous buildings. Furthermore, although the dream of completely cohesive administrative procedures throughout a large college is appealing, the reality is that many departments will need their own procedures to cater to their unique areas of study. A larger, broader college simply forces a larger power that can only govern in vague terms, and leaves departments with less leadership and more variance. Just to highlight my own perspective, my former College of Arts and Sciences had 27 departments, was larger than the College of Geosciences at Texas A&M (but smaller than most the others), and was located in at least a dozen buildings spread across our much smaller campus. The departments had their own processes for nearly everything, except major changes and refunding classes. The Dean's Office knew almost nothing of procedures at the department level, nor did we feel it was our place to make decisions for the departments about their fields of study, students, or curricula (our Dean, Dean of Research, and Dean of Diversity, were all chemists and veterinarians,--how could they give detailed advice to our departments of dance and journalism?). In contrast, the College of Geosciences at Texas A&M is a very small college. In the Dean's Office here there is constant communication with all of our departments, and guidance from the Dean has real, industry and academic value to the departments, because all are highly related to the College's academic interest. This College is incredibly organized and efficient. They are able to target funding to make sure students get the best possible education with the best people which creates the academic rigor Texas A&M is known for. The students enjoy resonating with their college's name and enjoy knowing their career mentors and advisors personally. Furthermore, the College can more easily advertise to students, employers, industry partners, who are interested in Geosciences specifically. I think all of this becomes much harder under the vaguer flag of "arts and sciences". Finally, as a side note, I believe the College of Geosciences is in a unique position to become increasingly relevant and sought after over the next few years. Climate change is an increasingly loud conversation in the social sciences (my undergraduate area of study), the policy making realm (my graduate area of study), and so many other areas in industry. Texas A&M is rather unique to have a college dedicated to Geosciences. Of all times, now would be the time to preserve and uphold that uniqueness

to students who are interested in their futures as it pertains to climate change and the environment. In conclusion, I would like to emphasize primarily that the smaller, topical structures in academia are a source of efficiency and strength for Texas A&M. Should a college of arts and sciences exist, it would be to the university's benefit to ensure there is still leadership and organization at smaller scales. Maybe this looks like a School of Arts, and a School of Science, or maybe it is something different, but I would urge you to find ways to keep areas of study unique and strong in their own way, otherwise you risk losing the family feel that Texas A&M is so proud of.

---

You should try establishing an online version of Texas A&M similar to Purdue University Global, University of Maryland Global, Colorado State University Global, and University of Arizona Global. This way you can establish Texas A&M programs that are accessible worldwide so anyone can be an Aggie. I originally wanted to go to Texas A&M but I decided to take an ediscovery program at Texas A&M International since it was online and less expensive. If Texas A&M offered online Associates, Bachelors, Masters and Doctorate programs like the ones at Purdue, University of Maryland, Colorado State University, and University of Arizona, I would be more interested to attend Texas A&M along with thousands, if not millions of other prospective students.

---

Huge proponent of academic realignment. ONLY if it to benefit the student. The student is there to receive an education, not a brainwashing from some professor and their closed off view of the world.

---

I have a son who is class of 22 in the Construction Science program currently housed under the College of Architecture. Graduates of this program are currently one of the most sought after commodities in the construction world. Part of this is due to the fact that they receive such individual instruction and development being housed where they are. If this program gets moved to the College of Engineering, I believe it will have a detrimental effect to those students. They will become just a number in a sea of students. I urge you strongly to not make this change!

---

I think the college needs to remain separated. For starters it is already next to impossible to get into the college of engineering with excellent scores and grades. Also the college of engineering does not allow you to go into a specific major until after your first year. A&M has a very high ranking for both colleges, why rock the boat and change now.

---

A&M should be a leader in environmental sustainability. The increasing importance of sustainable food systems was not evaluated. With climate change food supplies will increasingly need to change more due to weather changes and the need to reduce carbon emissions for transportation and fertilizer use. A&M is missing an opportunity to be a world leader in this area. I agree with the expansion of the Bush School in the area of education of undergraduates. The new curriculum should expand student's understanding of history in a more accurate perspective of Texas and the U.S. in terms of presenting a more well rounding understanding in the perspective of ethnic groups other than western Europeans. I agree with the creation of a visual arts department. I agree with the importance and unique niche A&M could fill.

---

I disagree with moving CoSci to Engineering.

---

I do not agree with the recommendation to move COSC to the engineering college. Feedback from parents and students that I have seen indicate that engineering is already struggling to meet the demands of their current majors. COSC does not resemble current engineering majors closely enough to deem following the same requirements. It's should remain in the college of arch or be made it's own college.

---

I think that the academic realignment to establish a visual and performing arts school, add new departments, and grow the department of visualization is an excellent idea. My daughter has been recently admitted to TAMU BS Visualization and another school that has a BFA &MFA in Animation. A strong fine arts program is attractive to us. TAMU has an excellent visualization program. Strengthening it and expanding fine arts can only benefit TAMU and makes it more attractive to a wider range of prospective students.

---

Creating bigger colleges means one thing, less responsiveness and representation of individual components....this is particularly damaging for the Liberal Arts, which needs a strong voice and presence at the university level...the combination of units also means that the new Dean can easily raid positions from Liberal Arts to build the sciences and geoscience...all of this tells us the low esteem held of the LAs at TAMU.

---

Arts and Sciences could become unmanageable. Could any programs and degrees be eliminated? We have entirely too many.

---

Realignment as indicated in the report would do great things for TAMU and open up many doors for program area growth as well as new degree programs. More degrees with a public service focus can be developed through the Bush School but also as BAAS degrees in areas such as; public administration, fire administration, law enforcement,

emergency management, organizational leadership, occupational safety/health, and public health. There are a wealth of system member resources in the B/CS area for TAMU to partner with and these types of programs are long since overdue.

Bringing like departments together into four main colleges will greatly streamline the academics and can only enhance the student experience at A&M. Go for it!

I am a little hesitant on giving any opinion on this matter. It is not too clear how this would affect the current students. I currently have an Aggie in the school of Liberal Arts and is already panicking as to how the changes will affect the degree plan and ultimately graduation date. If this is really necessary and changes are made, I would appreciate a clearer explanation to the students to put them at ease. Most especially to start the changes with incoming students and let the current students continue their education plan.

None

Where to start? 1) It is odd that Business wasn't mentioned at all in the "core colleges". 2) It strikes me as odd that even more departments are being added to Engineering, which many students perceive to be cumbersome and not working well. 3) Integration of Life Sciences makes sense, but I notice that not all Life Science departments (Biomechanical Engineering is one of them) are included in the idea. Also, I'm not convinced that College of Ag is the right location for the newly-constituted Institute of Biology and Life Sciences. In reality it is neither fish nor fowl, and would be best as its own independent entity or wherever the College of Science ends up. 4) The integration of Liberal Arts, Science and Geoscience is likely to cause more problems than it is proposed to solve - there is no common culture and the temperament of the faculty is extremely different between the colleges. 5) Doing something with Fine Arts is a great idea - Viz really has suffered from being under Architecture. 6) The closing of Journalism did not make sense when it happened, but, now that print Journalism is almost dead and broadcast Journalism is not exactly flourishing, I'm not convinced that resurrecting the degree makes sense.

I love the idea of a more robust and focused Arts and sciences school. Especially addition of Fine Arts. I currently work with another university in the Arts school and am surprised this has not become a bigger part of TAMU to create a well rounded curriculum.

(1) Reorganizing around the 'Big 4' ignores another big player.....Business Administration. They have become one of the largest and most recognized colleges on campus and should be recognized as such. (2) Seems like

I applaud the suggestion of moving the Biomedical Sciences Program from under the College of Vet Med. The BIMS office is poorly run and does not currently serve the needs of its students well in academic advising. The undergraduate program currently is at the behest of CVM faculty who may or may not teach the classes needed from semester to semester. The BIMS students are frustrated by it and the morale in the BIMS office is poor. This reorganization makes perfect sense and one hopes that accountability will be restored to the leadership of BIMS. The leadership of the CVM hardly knows that BIMS exists.

Strongly oppose combining colleges of liberal arts, sciences, and geosciences. MGT reasons many other Universities are doing it and the college would be bigger. TAMU is not other universities by design and THAT should be part of its branding. These individual colleges are very different in nature and size and this case having a smaller more intimate group of people can and is really serving its students well. One size fits all is not better and while it may not be PC to say, if you group sciences and geosciences with liberal arts, I believe those degrees will be devalued in the job market place. Furthermore, I do not believe the cost savings of combining the administrations of these colleges (ie. reduction in force of admin) would outweigh the complete loss of tailored support and feel of community it provides our students to have their own college and peer group. The college of geosciences has gone above and beyond for welcoming incoming freshmen, providing student academic preparation for college (GAP), get to know you events, field trips, etc. that have helped my student tremendously. I do not believe these value added services nor community can be achieved in a combined everything but the kitchen sink college.

**Q43 - Please provide your comments related to Student Affairs:**

## Student Affairs - Faculty

Please provide your comments related to Student Affairs:

Please do not centralize academic advising. The relationships between advisor and student are a big piece of what keeps Former Students tied to this place. The longterm economic fall out of weakening that relationship will be an unintended consequence. Donors love relationship!!

No opinion.

I have consulted in many departments and the universal input is an extreme wariness of centralized advising. Even Chancellor Sharp waxed eloquent about his former advisor in Political Science, as opposed to a "take a number" central service.

None

It is unclear what High Impact Practice is or will mean for changes for these programs.

student affairs and the experience in addition to the timeliness and accessibility to the students should govern these ideas....student centric

Not sure

I encourage the high impact activities.

Centralizing IT might be good for undergraduates but it is a nightmare for employees on campus who have specific computing needs unique to their research or equipment in labs that they need to have on networks. Centralizing human resources might be an improvement because now each organization on campus has different procedures. Perhaps they could issue employees IDs and streamline the process now handled by the student business services group. I have never seen such a ridiculous process for something that is instantaneously produced. I think that centralizing communications across the different colleges will be a hard sell to AgriLife as communications is part of their mission and always has been. I would tread lightly there.

Centralization of advisors would be disastrous for Sociology. The case in the report has no statistical basis and represents only a small element of the work advisors actually do. We have a very close relationship with our advisors and they have worked hard to make durable relationships and generate trust with our students. Losing them as a resource would be devastating for our drive to recruit and retain. You can't put a price on this type of work.

I could not find Student Advising when I went back through the report, but I think it could be here. DO NOT centralize all student advising. If you want the ability to recruit and retain students, to be a first-rate Latinx-serving and First Generation-Serving institution, do not make this mistake. As a faculty member and a parent with a child at TAMU, I cannot emphasize enough how important it is for our advisors who have the depth and breadth of knowledge to serve their assigned majors. Knowing about specialized programs, about career opportunities, about instructors in the major, and building a relationship with their students are all essential components that will be lost with centralization. Walking is healthful; let those students changing majors walk to two buildings; they will be fine.

TAMU will continue to have student recruitment, retention, and belongingness issues with underrepresented students so long as it continues separating this from discussions about a more diverse faculty. DEI is not exclusively a student affairs issue. Furthermore, the centralization of advising is a HUGE mistake -- especially for underrepresented students who studies show need advisors in closer proximity (intellectually, culturally, and spatially) to them.

ADVISING SHOULD NOT BE CENTRALIZED!!!! This is not in the best interests of students --- if implemented I see a negative affect on time to graduation. I have experience with this in Liberal Arts.

Again, consolidation and streamlining seems like a good idea, but only if it takes down barriers rather than confuses things. From my perspective as a faculty, students have a very hard time navigating the academic support structure here, both in terms of mental health counseling services and Career Services. As a parent who has used Becky Gates Children Center, I should comment a bit on its relocation here: I don't care so much where it is located in the organization tree, except that putting it in "Academic and Strategic Collaborations" sends a signal that it is more outside of the University's core mission. But we need to remember that, like Counseling Services and the Disability Office, providing accessible daycare for the students, staff, and faculty is essential for their success. In this regard, the

University has failed significantly: Becky Gates does not have an infant wing and hardly enough capacity for the number of people who are trying to use it. Yet rather than expand it, the University commissions as competing daycare right down the street from it! This is insulting for those who have children and had to wait years to get in at the University daycare. I would hope that the University would be more invested in this, since it makes a HUGE difference for faculty recruitment and retention. We lost a lot of time, not to mention money, figuring out daycare in the area in our first year here--time that could have been better spent on other things.

---

In connection with my role as senior associate dean of Texas A&M University School of Law, I, along with the dean of the law school, prepared a memo containing the law school administration's response to the recommendations in the report. The dean will share that memo with the president and COO of the University.

---

It seems that removing the current units from Student Affairs and integrating some units from the Office of the Provost to Student Affairs does make sense since Information Technology may best be supported by the Department of Information Technology, and Counseling and Psychology Services makes sense to move to the Texas A&M Health department. What I do not understand is why would the University Art Galleries not be moved to the college or department that oversees art and art students?

---

Proposed changes are fine. I do not agree with centralization of advising.

---

Centralized advising is disastrous as it would instead create a lot of misinformation between programs/colleges and the advising office. I don't think we need to create a new office of recruiting, instead expand the role of the admissions office to be able to handle this.

---

Some of the groups going in and out made sense to me. However, saying student organizations (like Fish Camp) have too much say is like saying faculty have too much say in the classroom. Students have staff advisors who provide parameters, but the content of their organizations is up to them, as long as it aligns with their stated mission and constitution. If A&M wants to make it more clear that groups like Fish Camp are student groups and not officially Texas A&M, then do that, but don't take away the freedom and learning from the students. Also, when Fish Camp hit legal troubles in the past, the only thing saving Texas A&M from huge financial consequences was that it was separate entity run by students. Don't take on this legal burden, if you don't have to.

---

Centralizing student advising is a very bad idea. Students need advisors that know majors inside and outside, not advisors that can only address questions about core requirements, etc. The college of liberal arts recently centralized advising, and it has been an unmitigated disaster. Students do not feel as if they are being served as well as they were served by individual departments. The idea that it's difficult to change majors does not present a compelling argument for centralizing advising. I would say that this is the idea in the report that has received the most universal negative feedback in every discussion I have had.

---

Please allow each department to maintain advisors in the department. While there can certainly be some centralization, to fully remove advisors would not be in the best interest of the students and will create many issues that the current advisors understand and know how to deal with.

---

Centralization of student advising is a very very unwise idea. The process for changing majors now is not overly complex for the young adults that we serve. They have to visit exactly two offices. We have 17 colleges at TAMU- each as different as the next. Centralizing advising results in loss of all the local knowledge required to guide our students through their 4 years here. Advising should remain individual for each college- if we want to serve our students in the best way (which might not be the most efficient from a consultant's point of view).

---

The MGT report fails to address the burning need of the university to address lack of diversity at Texas A&M. While efforts had improved to recruit and retain Latinx students, it has failed visibly to make similar progress for Black students, especially. The report acknowledges this. But recommendations will not remedy this. DEI should be a priority and its administrator should report directly to the President and Provost. Moreover, the report does not address the complexity of "diversity" nor reflect an intersectional understanding of diversity as related to race, gender, sexuality, class, and ability. The "programs" such as Africana Studies, LMAS, and WGST should receive greater support, including department-level status. These programs are intersectional and interdisciplinary. Compare to universities that inspire us, A&M has starved and marginalized those programs. Greater visibility and status for such programs will aid in recruiting and retaining the diverse student populations who live in Texas.

---

I have concerns about centralizing advising, both for reasons related to logistics and to creating a nimble advisory system that can respond to student needs. I think the current system of advising within departments works well, and should remain in place.

## Overall good recommendations

None.

Centralizing Academic Advising is a bad idea. We need academic advisors who gain an understanding of what we want for our majors, and that is unique to each department or program. This will create delays in time to degree for students.

My [REDACTED] opened the Money Education Center in 2016. He has worked hard over the years to provide the best financial literacy services to the students of Texas A&M. Throughout this time, it has become apparent that this is a much needed resource on campus as students need to be more educated when it comes to financial decisions so that they can graduate from Texas A&M and go into the world to lead a fulfilling life without being stressed about financial decisions they made back when they were a college student. Over the past year, under Scholarships and Financial Aid, I have watched the Money Education Center be crushed to almost nothing. As most are not aware, all of the Money Education Center Advisors are being repurposed for the opening of the Aggie One Stop in January 2022. My husband has watched his team be dismantled and their focus put on learning about Admissions, Registrar, Scholarships & Financial Aid, Student Business Services, and Veteran Services. There has been so little emphasis on the Money Education Center's part in the Aggie One Stop that their name is not even listed on the Aggie One Stop page (<https://eas.tamu.edu/Aggie-One-Stop>). With the news of the Money Education Center possibly being moved under Student Affairs, the employees of the Money Education Center have been elated about the possibility of not having to watch the Money Education Center be dismantled anymore. Under Student Affairs, not only will the Money Education Center continue to exist but it has the possibility to grow and reach more Aggies than ever before. I strongly urge you to accept the recommendation of the MGT Report to move the Money Education Center to be under Student Affairs. The Money Education Center needs to be able to continue to exist and grow to provide Aggies with the resources needed to make decisions about their finances that will lead to success.

As a former student affairs administrators and a higher education scholar, I strongly agree that the student affairs division needs further support and allocation of resources. This unit provides key strategies to enhance the retention and success of students through campus life activities and essential services that foster their sense of belonging, competency, and learning. In the report, there are recommendations to add areas such as career services to student affairs, which I agree but to also remove counseling services. Historically, counseling centers have been part of student affairs units to provide students with holistic support and wellbeing and I strongly believe that this service should remain part of student affairs. The CAS standards call for this and having counseling services as part of student affairs allows for stronger collaborations and case management that will influence student safety and success. Grounded on growing scholarship on the needs of minoritized students, I agree that more support needs to be provided to students of color and first-generation college students on campus. With this, I think that the report missed an opportunity to highlight the need for support services for undocumented students as part of this larger group. The student affairs division and department of multicultural services can serve as an outlet and space to expand services to this student population and directly have a staff member who works with UndocuAggies. Texas was the first state to expand access to in-state tuition to undocumented students and as a land-grant university, TAMU should make serving this group of students part of its mission. The department of multicultural services can have 1 staff member in charge of working with immigrant students, including undocumented students, who are a growing group on campus. They can offer relevant programs and services and train others around the institution so that students can be better support and graduate.

No comments.

None

## Support recommendation #3

I would like to push back against the centralization of academic advising. As an instructor, it has been very useful to have close contact and to work closely with the academic advisors in my department. I believe this could be lost if advisors are more distant to faculty and are not specialized on particular fields.

Recommendation 1: I think placing the Aggie Honor Council in Student Affairs sends the wrong signal to students and faculty. Academic Honesty is core to the Teaching mission of Texas A&M and the Honor Council is the purview of the faculty. Will the voice of students in deciding what organizations to fund be maintained when Student Affairs Financial Services moves to the Division of Finance? Recommendation 3: It may be a good idea to move Counseling and

Psychological Services and Student Health to Texas A&M Health. Currently, with 30 counselors for 67,000+ students, Counseling and Psychological Services is underfunded.

None

student advisor services need to be anchored within departments in order for advisors to be effective. There is too much department specific knowledge that a generic advisor cannot specifically master. We have seen a huge decline in quality of advising services since liberal arts pulled departmental advisors out of departments and into the new LAAH building a few years ago. My department's advisor left the university and we still do not have a replacement. When we get one, they will know nothing about the department or its students. This will be compounded if the new reorg does not return advisors to the individual departments. When we had advisors in the building there was much more communication, interaction and collaboration between faculty and students due to the presence of the advisor.

none

As stated above, even though the report recommends more centralizing and also outsourcing of services. From the perspective of a faculty member who spends significant time with students, these changes are likely to reduce the personal nature of education and what TAMU students love about the University. Centralized advising will again make things less personal and result in long-term alienation of the relationships that make this institution great.

No comment

Advisors are the frontline of student success. Advisors must be knowledgeable, passionate, and empathetic. This is possible at this moment because they are couched within academic units, have a strong sense of belonging and duty, and are know the particular department and its student body. To centralize advising would be wreak havoc on student success. Advisors would be disconnected from the academic units, their faculty, staff, and students.

Recruitment and Retention of Students should be extended to graduate and professional students...maybe even focused there. Centralization of student advising seems like a smart move, but only if the student advisors have the bandwidth to understand the tremendous variety of offerings across all the different Colleges. What works for one College doesn't necessarily work for others, there is no "one size fits all" system.

Merging Health Services with the Health Science Center seems to be a good idea. I know too little about most of the suggestions to discuss either way!

Reducing the number of steps required to change major seems like a remarkably absurd reason to change the advising organizational structure, so much so that it weakens the credibility of everything else in the report.

As noted above, I believe the Aggie Honor System Office and Public Policy Internship Program should remain in the Provost's Office because their programs are related to academic credit.

My concern about moving student Counseling out of it's current location is will this really help our students or is this just a move to make things look more neat and organized?

no comment

The Money Education Center is quite good. Expanding their role would be helpful. I know from my own ongoing research that financial literacy is a problem for undergraduates (I've literally surveyed them on this topic). I have no opinion on the other statements here.

A credit-bearing internship program should not be in Student Affairs. PPIP should remain under the Provost's purview. It is clear the management team did not understand the difference between student organizations that manage programs like Fish Camp and FLOs, those that are pre-professional or academic, and those that focus on more social interests such as sports, arts, religion, politics, Greek life, entertainment, etc. Student Organizations with different levels of affiliation should be treated differently and their missions should reflect their purpose.

Recommendation #2: Align student organization management practices to ensure transparency and accountability. Comments: This is an excellent recommendation.

Although standardization of advising practices should be coordinated through the Office of the Provost, advisors and discipline-specific advising practices are better administered at the college and department level.

The report completely ignores the experience of graduate and professional students at TAMU, yet, our graduate student population is one of the largest in the country. In the process of creating a graduate school gaps were identified in the ability of graduate students (especially those enrolled in distance programs) to access student services. Because

graduate and professional students are systematically ignored, nothing suggests these services will be more attentive to the unique needs of graduate and professional students. The fact that they are completely ignored suggests the opposite. Remember that graduate students, professional students in Dallas (Law), Ft. Worth (Dental), Kingsville (Pharmacy), Qatar, or Galveston and purely distance education students are Aggie students too. They have complained about the ability to access student services. It is not clear that the recommendations will worsen this problem, but it is also not clear they will help. This is a missed opportunity to think strategically about ensuring those students can access services (like counseling services) or that the services will meet their somewhat different needs.

There will be a huge issue with the recommendation to Centralize Undergraduate Advising and everyone I have talked to in the college of engineering says that this will negatively impact their daily lives and the daily lives of their students. There is no way that a centralized advising office can have intimate knowledge of the details of the degree plans and career paths for different majors. Our department's undergraduate advisors play a critical role in our student's time at TAMU. Their offices are in the same building where many students meet to study. There is a high level of access and personal rapport that will not be replicated by a centralized advising office.

I think the university cannot bolster student health and counseling services enough. Glad to see this emphasis.

None.

I have no issue with combining the Counseling center and student health with the Health Sciences Center, as long as the integration, in fact, serves our students in the best possible way, and it is not designed to curtail services or decrease staff.

McAllen currently has one person serving as liaison for the whole of student affairs. Additional support would be helpful.

No comments

Recommendation #3. I think integrating Student Health Services and CAPS into TAMU Health is a good idea

Student health is the key area. Trying to identify students suffering from stress and/or depression is really important. Suicide prevention is a difficult problem and dealing with psychological problems before they reach dangerous levels should be a major focus.

Advising needs to remain local / decentralized to maintain local connections and knowledge with curriculum and faculty resources. Salaries for academic advisors need to be raised.

Student success will improve with the realignment here. That is what we are here for, and research.

No comment

NC

taking away in-house advising in mathematics would lead to math majors or prospective math majors getting poor advice due to a lack of subject matter, course structure, and career expertise, etc.

There are many things to object to in this report, but the one thing that must not be done is to centralize advising. That has not worked out well for students on campus in units where it has been tried, and as far as I can tell, it suffers the same problems it did when I went through a school that had centralized advising. There is a loss of focused expertise, and the student experience suffers. Justifying centralized advising because of what is presented as an onerous five-step process is silly. Most of the steps will still remain, like 'determine the requirements of the degree the student wants to transfer to.' The report recognizes the fact that students currently change majors at a high rate, suggesting there is little real impediment to doing so. In any case, changing majors is something that students should give some thought to, and not something they do every time they don't get the grade they want on an exam or in a course.

Student Health Services, Counseling and Psychology Services, Student Housing, Memorial Student Center, and University Center stay with Student Affairs

"Expand student 'High Impact Practice' (HIP) services so that they continue to align with TAMU core values and standards while also preparing students with the necessary 'college knowledge' about how to navigate their experiences while on campus." - absolutely. Having TAMHealth handle Health of the students makes sense only if the resources are committed to developing this over time. If not this is a recipe for disaster.

I am concerned about the evidence base substantiating the recommendations made.

Support Recommendation #1. This is part of the overall organization changes that make so much sense for focusing and clarifying these various offices. Strongly oppose Recommendation #2. Here is an area we do not want to match the trend of our peers, which are imposing uniform ideology on student organizations and pressuring differing groups off of the university campus under the guise of having "student organizations... strategically designed to provide leadership development and accountability opportunities." Texas A&M is a national leader among public universities in supporting diverse opinions and worldviews. We should continue to respect freedom of expression in student organizations, particularly religious groups, that may not be popular. The university must be a public forum which recognizes the variety of points of view, strongly held convictions, and allow right views to be adopted by debate and persuasion and not compulsion. No opinion on Recommendation #3.

No comments.

One of the most critical indicators of a student success in their academics and on-time graduation is the quality, strength, and empathy of their academic advisor. It is critical to ensure that this is the single most personally motivating interaction a student can experience in their decision to study a discipline, complete the appropriate coursework in the necessary order, within a particular timeframe, in order to meet their graduation goals. Students are a universities client and the deliverable we provide is the degree to allow them to transition into proud, successful, dedicated alumni. Great thought and input from students, academic advisors, parents, and other constituents is necessary to make appropriate decisions for advising across the lifecycle of a student's career at TAMU. Assessments, focus groups, input from Advisory Boards, Alumni, Parents, Faculty, and information gleaned from exit interviews, and other means should be considered to make the decision that will allow students to feel secure, nurtured, confident and informed regarding their curriculum, courses, plan of study, pathway to graduation and placement into their careers. A&M is unique in that there are not many other universities with which to compare ourselves, especially in engineering, due to the sheer size of our student body. So, solutions that might appear to be best in class at peer institutions need to be tested against TAMUs environment, resources, and size of student body and geographic size of the campus.

The student must always be number one. Whether they are I have no way of knowing.

I am no expert on all of this, but I lack confidence that students would be benefited by the centralizing of advising. Advisors surely need to know the complex details of specific programs and I am not at all sure how this could work.

The proposed changes follow the overall logic of the report and realignment in consolidate portfolios of leadership so that there is complementarity not overlap in mission and objectives for students services and affairs.

I'm not so sure Academic Advising should be centralized. I don't think it's in the best interest of the students.

I am completely opposed to the centralization of UG student advising. I cannot think of a scenario in which a generalist advisor could provide better guidance to an UG student with regard to specific issues related to their academic degree plans. There are probably hundreds of programs, certificates, minors and I cannot believe that a central advising infrastructure would have the knowledge necessary to provide effective academic advise.

Ok

I concur with recommendations #1 and #3, BUT I strongly disagree with recommendation #2. I do not agree that advising should be centralized. Students build relationships with advisors in their units, and advisor build highly effective relationships with their teams. This is essential to guide students through their concentrations at TAMU.

I am currently a member of the Honors Council, and it always struck me as odd that academic integrity violations are not handled within the same unit as other student conduct violations. Stealing answers to a test are, at least in my mind, are little different than stealing a wallet. Relocating the student health center to a larger unit that specializes in health makes sense. I would like to see its role expanded to include the health of employees as well as students.

Shifting to centralized advising will hurt students and probably end up costing more. Our department is a large and complex where students can follow several different tracks. These tracks are all civil engineering - but very different areas of civil engineering. Water resources, structural engineering, transportation, environmental, geotechnical, etc. This takes very specialized advising help for the students and we do that as a team in our department. Both the faculty and the undergraduate office take on the very important role of advising...both for courses and their career. Centralizing this would be incredibly difficult and require extremely specialized knowledge that is highly unlikely to

happen. And once our department sees centralized advising failing students we will start our own advising and end up duplicating advising efforts as we refuse to fail students on this issue.

I strongly strongly support moving counselling and student health into the health department.

I am uncertain how moving Counseling and Psychological Service and Student Health Services is going to improve services? As far as I'm aware, TAMU Health does not offer services to faculty or students. Bolster these two under Student affairs.

No comment except to carefully consider the pros and cons of centralized undergrad advising. Most people have good reasons for not favoring centralization of advising.

I see large overlap between this and proposed new Academic and Strategic Collaborations section - the VP for student outreach. I don't think the recruitment and retention of undergraduates should be handled by two separate entities.

Different fields, majors, and courses need different equipment -- for student technology, classrooms, and research. It seems as if the report wants to standardize things in a way that makes technology less adaptable to student and scholarly needs.

No comment

If the centralization of Student Advising means more transparency and accountability, I am for it. But the localized knowledge should be retained, meaning they must know the department and the degree. No automatons pushing buttons to channel students to whichever course program. In my experience, student advising has repeatedly, over the years, made ex officio course substitutions that were not in the books, for the sake of expeditiousness. I am not appreciative of that. Timely graduation is important, of course, but this went beyond it. These advisors are so swamped they refuse to help out with the names and courses of students in their respective degrees. We have to compile lists ourselves and cross interview students. The work only for INTS students and not for the rest and the modern languages. I would give them more support, because they must be overworked, but also tone down the hubris a little. I was told they stand between the College and the department. In my personal experience these relatively young employees look like they command a lot of power on their own: how is that so? what have they done to earn it, exactly? I wonder.

Moving Student Affairs Communications to a centralized Marketing and Communication could lead to missed opportunities for specialized communications to current students.

As very new faculty, I am still not familiar enough with Student Affairs to be able to provide useful comment.

I agree with the reorganization plan for student affairs, which streamlines and focuses services for students and moves other services to more appropriate offices.

The findings and recommendations seem reasonable.

Academic advising should really remain de-centralized to some extent. There are significant differences in requirements between majors and academic advisors currently have good ownership of their respective roles. Centralization may save money, but it will absolutely come at the cost of service to the students.

I support these recommendations

Please do not consider centralizing UG advising. It just doesn't make any sense as different majors have different requirements. Every major is unique in its own rights. What exactly are the benefits for the students if the academic advisors were not aware of peculiar details of a major? Why trade one less office trip to visit for a clear reduction in the quality of advising? Not to mention this will require a huge overhead of retraining all advisors (in order to be able to deal with \*all majors\*) Did MGT even consult our academic advisors before making such a recommendation?

I do not believe the Aggie Honor System will do well if moved to Student Affairs; faculty will not respect the process, they will suspect Student Affairs will be too lenient.

The idea of centralized advising is absurd. Student advisors need to have localized knowledge specific the the departments that house a student's major. Contrary to the report's assertions, requiring students to visit multiple offices when changing majors (something most students never do, and those who do only do once) is not a large burden.

The graduate advising after centralization is a disaster - no experience/hard to reach/no clear chain of command....

No comments. Recommendations seem reasonable.

The centralization of advising is quite concerning. Our departmental advisors are a mission critical resource in our department, and do spectacular work to guide our students through our program. They know our curriculum and catalogue upside down and inside out, and provide a welcoming environment for our students. I struggle to see how we would function with a centralized system, unless that meant they were redeployed to the department. Keeping local advising is important for the student experience. These advisors have specialized knowledge, and with a fully centralized model it will be next to impossible to provide the detailed knowledge and help our students need and deserve given the breadth of educational opportunities they have here at TAMU. While I would certainly support equity raises amongst advisors, and recognize that some college level or more general centralized advising could be a helpful addition, I struggle to see how this model will be effective. I would also support making the change of major process more efficient for students, but don't see centralized advising as that solution.

Centralizing advising is ill advised. The report cited a report done a couple of years ago that was taken out of context. Expecting advisors to understand the nuances of every degree program at this University is ridiculous. If the intent is to group them than why move them at all. Centralized advising has been a disaster in COALS, leaving faculty to pick up the pieces, taking further time from our key missions.

Students at the SAG Forum on Nov. 4, 2021 that centralizing advising would diminish the personalization on such a large campus. They were also fearful this reorg. was a tactic to reduce staff.

In our department, faculty do the advising, and in my experience this works well, and is a good way of doing it - moreover, these faculty devote countless hours and great energy in this effort. I can not imagine that a centralized advising staff member could do this well enough - they would need to know the intricacies of math advising, plus be aware of special programs and credits students can achieve. One example is a special one-credit-hour course that is offered, and we rely heavily on advisors to encourage students to enroll (including when they need an extra credit or two): <https://www.math.tamu.edu/undergraduate/drp/> Moreover, although centralized advising would generally be fine for some students, in any special circumstances (a student who needs extra help or is extraordinary in some way) will likely receive poor advice from a "centralized" advising person due to a lack of subject matter, course awareness, and career expertise, etc. Indeed, as an undergrad, we had centralized advising, but my "better" advising came in-house, through the math department itself.

I am concerned that moving the Aggie Honor System Office under Student Affairs will allow faculty to ignore the academic integrity adjudication processes. This may leave students vulnerable to bullying and penalties being imposed without appropriate review.

- Centralizing has many known disadvantages, but can be done well. The quality of centralizing functions such as IT, HR, etc, will depend on recruiting strong leaders into those units who have the skill set to create a mission and customer-oriented focus. It will also depend on the ability to staff those units to perform the work required, without gutting the ability of departments to function by taking staff. There is one area where the proposed centralizing is very problematic however it is done. Academic advisors should not be removed from departments or, where appropriate, from colleges. Our advisors know our programs inside and out, are able to give high quality advice and direction to students because they have specialized in these programs and interact with faculty and know the classes, and they assist department/college leadership in structuring and restructuring programs and courses. There absolutely should be more support for students switching majors, and maybe a small central advising unit to handle issues like this and work with students. Centralizing all advisors, especially if this involves relocating them to one physical space or expecting advisors to specialize across multiple programs. Doing this would hurt the students, our ability to retain and develop advisors, and the department functioning and ability to offer courses needed by the students and have viable curricula.

Recommendation #1 (Reorganize): I am supportive of this move Recommendation #2 (Align student organization mgt): Hopefully this doesn't diminish the students' ability to take ownership and feel vested in their organizations. That has always been one of the best growth experiences for Aggies and makes our University special. Recommendation #3 (Division of Facility Information Services): it needs to be fully funded and staffed.

Proposals #2 and 3 seemed logical. In contrast, Proposal #1 seemed hit or miss and there were portions with which I disagreed-

- o Music Activities (except for the Aggie Band) to Academic and Strategic Collaborations
- o Becky Gates Children's Center to Academic and Strategic Collaboration Student Affairs
- o Communications to Marketing and Communications
- o Student Affairs Financial Services to Finance

nothing to comment

Proposed reorganization seems reasonable to me.

---

**Diversity and Inclusion** One of the most disappointing failures of the report is its recommendations about improving diversity, equity, and inclusion (DEI) at the university. The report is absolutely correct that Texas A&M suffers from a seriously bad reputation on DEI issues. While there have been some improvements, these have not been uniform across the university, and the fact that our demographics still do not mirror the demographics of Texas, or the United States for that matter, despite decades of at least nominal effort by administration demonstrates that we still have a long way to go. In short, this problem is nothing new. This makes the perfunctory recommendations in the MGT report to improve DEI issues on campus even more egregious. Yes, of course we need to improve our recruitment efforts. We've been saying that for decades. However, creating a new position to focus on recruitment won't move the needle significantly if we don't also address the serious problems we have with the climate at Texas A&M. It's unconscionable that the MGT Report didn't address climate at all, not even acknowledging that the university recently did an in-depth analysis of climate, with specific recommendations, not one of which is so much as mentioned by MGT. Finally, I have nothing against creating an administrative unit at Texas A&M that focuses on DEI issues. Indeed, I would wholeheartedly endorse such a recommendation. Nevertheless, MGT's rationale for moving such an office out from under the Provost is unsettling given their claim that "[t]here is a need to condense and focus the Provost's office to elevate the profile of teaching and learning within the auspices of Academic Affairs." While it can be argued that DEI issues affect far more than just teaching and learning, it cannot be argued that DEI is not integral to teaching and learning. There's a misalignment of reasoning here that is disconcerting to say the least.

**Flawed Guiding Assumptions** While I applaud MGT on much of the work they've done, it's clear that they were given an overriding mandate to focus on administrative efficiency. I don't think any faculty would seriously argue that administrative bloat is a good thing. Similarly, faculty across the system would love to see money currently being wasted in administrative inefficiencies be returned to departments and to students. Nevertheless, the MGT consultants, whether by mandate or by oversight, have operated under the false assumption that administrative efficiency is necessarily cost-free and, in all cases, "good." This is glaringly apparent in their recommendations for revamping student advising, consolidating liberal arts and sciences, and restructuring life science programs.

**Student Advising** There can be no doubt that there is room for improvement when it comes to undergraduate academic advising, and the MGT Report raises many reasonable concerns. For instance, it correctly points out that advising positions vary widely in terms of training, duties, pay, etc. Its points about easier onboarding of academic advisors are also well made. That said, the overriding justification for consolidating all advising on campus is that it would make it easier for students to change majors. This is deeply problematic. First, it's not obvious that changing majors more easily is necessarily desirable. Indeed, it could be argued that there should be a relatively high transaction cost to changing majors. That cost shouldn't be insurmountable, but having some barriers reduces impulsive decisions and provides opportunities for student issues to be addressed within departments. Second, the report fails to consider the tradeoffs of consolidating student academic advising. For instance, individual undergraduate programs can be complicated to navigate. Students moving through, say, a meteorology degree face very different challenges and choices than a student pursuing a degree in education. Decentralized advising may make it harder for students to change majors, but it also provides rich local knowledge of individual programs, classes, professors, research opportunities, etc., knowledge that would be lost through centralization. The MGT report doesn't address these issues because, again, it is assuming that administrative efficiency has no tradeoffs. It's alarming that no one seems to have asked the question if making it easier to change majors is more important than making it easier for students to navigate the majors they're in.

---

**Transferring the Counseling and Psychological Services to Texas A&M Health:** the main rationale for this is that students who need longer-term care, in current structure, need to transfer to a new provider. I really worry about this. One – currently urgent care is available through CAPS (such urgent care would be much harder to reach with Texas A&M Health). Second, CAPS is a university organization that understands better students' needs and challenges, but also has other types of resources at hand to help (not just medical). I.e., often the solution for the student is not just a medical intervention, but an intervention to reduce course load, change the exam schedule, etc. This would be very difficult to manage through Texas A&M Health, however, CAPS can do it. Third, CAPS also comes to talk to departments about mental health, provides group sessions, etc. Again – those things would be much harder (if not impossible) under the auspices of Texas A&M Health.

---

Given that only 2.6% of current students were consulted in this report research, all areas of Student Affairs should be discussed in public forums with students as well as student committees formed to aid in these decisions.

Not sure if this is the section, but it sounds as if we are cutting back on student health services in a general sort of way, by folding them into something else. From what I hear from students, we aren't over-providing health services at the moment, and this might be an area for investment rather than slashing.

---

I think centralizing advising is a major mistake.

---

The suggestion to move CAPS and Student Health Services to Health Sciences is a good idea and could enhance students' accessibility to much needed services.

---

How can centralizing units "elevate student success"? Student success probably has declined compared to 10 or 15 years ago because of all the new students coming in from our feeder junior colleges. At those colleges they do very little work for a B grade, and then they get here and get slammed with a reading load, or labs, or projects. I wonder how many students who took calculus one at Blinn can survive calculus two at A&M. The point is, this is a Research One university, and faculty load on the work. A lot of students don't have the work ethic or interest, so they drop out or aim to just get by and get a degree. Recommendation #2 Centralize undergraduate academic advising. This will be a disaster. Someone in liberal arts will be giving advise to an engineering student. Frankly, it was better when we had our own departmental advisers in our department.

---

We centralized advising recently in our college. Service plummeted. To me it is 100% organizational. Why? Because the same people are generally involved but quality of service changed specifically when the administrative structure changed. There are various challenges that are not fixed. A theme throughout the "centralization" changes here seems to be that staff are not paid as well as prior to centralization and then administration wonders why there are morale and performance issues. Attention to this is especially important when you are thinking about changing things that affect student services.

---

I don't know.

---

This is a great idea, long overdue.

---

It is vital that students receive advice from well trained advisors with a strong background and knowledge of the degree and aspirations of the students. For instance, they know the courses that will help students get into medical school etc. Centralization of advising will not be optimal.

---

Reorganizing student affairs might be a good idea, though it will depend on the implementation. Faculty and administrator input would be especially valuable in this regard. Aligning student organization management sounds like a good idea, since it is presently a bit chaotic.

---

My biggest concern is just remember that this area is one of the most highly rated areas of all the units. Make sure what you do does not end up being a step backwards. But I do agree that realignments of what they do and are over is in order.

---

The Center for Teaching Excellence is a resource for faculty development, not for students; so it would seem a better fit under the VP for Faculty Affairs, instead of the Assoc. Provost for Student Success.

---

Moving high impact practices into the teaching administration makes sense - it would offer more opportunities for integrating into the academic curriculum.

---

I agree that student health services, and we are in need of better mental health support for students, faculty and staff on campus. Part of this, though is a national issue, and a healthcare issue.

---

There is a lack of understanding on the Center for Teaching Excellence. It is only indirectly related to students so I do not see how it fits in student affairs. It naturally belongs in academic affairs.

---

As far as advising goes, I agree that changes need to be made. If the consolidation of advising occurs, please make sure that all advisors are competent in all areas, or partition the advisors based upon major. I know that personal anecdotes have limited value but I will share mine anyway. My youngest, who is a 5th-year senior at A&M had an advisor in his major (ALED), an advisor in the Corps of Cadets, and an advisor with Blinn team. Needless to say, he received contradictory advice, was required to change majors, and is unable to graduate on time. I understand the efficiency of centralization, however, degree expertise is necessary for anyone serving in the role of navigating students toward graduation.

---

I think adding some staff oversight to Fish Camp is a wise addition and will help with continuity of that organization that is often lost each year with the students. We do need expanded access to mental health services as many of our students do need longer term care and that can not currently be accommodate by CAPS. We also need more people

---

working in this capacity due to the demand for mental health services and the lack of available providers in Brazos County.

The report is right that it should be easier for students to change majors when they develop intrinsic motivations. However, is centralizing advising the most effective way to flatten the current hurdles to curricular change? Would advisor's knowledge of particular curricula be lost through centralization?

Slow action by Honor Code office is a very serious problem.

Centralizing advising is a bad idea. For us (mathematics), it is important that advising is done by faculty. Indeed, advising is much more than just checking whether a degree plan satisfies all the technical requirements or signing a few forms (which, I grant, can be done by staff). To do it well and efficiently for the students, it requires a fairly detailed knowledge of the subject matter, how courses interrelate, as well as of the professional culture in the field.

I am concerned that centralized student advising will diminish very important communication channels between faculty and area advisors, favoring students who change majors over those looking for more targeted advice.

I agree that student health - especially mental health - needs to be a primary concern and that students need more direct and clear guidance. Recommendation #2 - how will affect student organizations when they are at logger-heads with a university decisions? Will this stifle those students and their 1st amendment rights to assembly and free speech?

can't comment

The only time the word honors appears is with regard to faculty honors (a responsibility under faculty affairs). I would love to know why there is no movement to start an undergraduate honors college. Honors within the college of liberal arts has just about been killed with the death of the Cornerstone program. We need more robust honors within liberal arts in order to attract the best, most creative, and thoughtful students.

many reasonable suggestions

Student advising needs to happen as close to the individual programs as possible. There's no way to manage in the best interests of the students without tight integration with the authors of their programs and schedules.

With the growing student population, faculty needs to have sufficient resources to effectively advise and teach while providing students with research opportunities.

This is like rearranging deck furniture on the Titanic.

Consolidation of academic advising also appears to be a very ill-advised recommendation. Students depend upon the accumulated expertise of advisors in their home departments to help them make informed choices on courses to take, timing of courses, etc.

I approve of most of those suggestions, especially greater guidance of student organizations. I think the LT Jordan Institute, however, should be moved to the Bush School along with International Studies. I can't remember where PPIP ended up, but it should also be at the Bush School.

Someday soon, the public will figure out that undergraduate education is a low priority at A&M. As a former administrator, UG education comprised less than 2% of the entire discussion time in department head meetings with the dean. An associate head said I was being generous when I said 2%.

I am not sure that removing the Becky Gates Children's Center from student affairs makes sense. It does not serve the broader community but students, faculty, and staff of TAMU (in an essential role, providing very high quality childcare that is otherwise difficult to find in BCS). In addition, there is no other programming to support students with young children/families within student affairs.

I reiterate my suggestion from the Provost Office input that the TAMU Career Center should not be folded into this mission. It is too valuable and integral to academic Student Success.

A major revamp of student affairs is necessary. Providing comprehensive, well-managed high impact opportunities is increasingly more important, so I support the proposed changes.

The university should be first and foremost concerned with creating a quality education for our students, not just our research interests. I think some of the recommendations will help but there seemed to be an over-emphasis on equity and inclusion which in some instances is excluding students and faculty.

What happens to BIMS graduate students already in the pathway for a PhD in biomedical sciences, not Science? Where is the translation of science going to come from under the proposed new alignment

Every single student is an individual, and our goal in teaching them is that each leaves after graduation enhanced for a lifetime that is productive and happy. The proposed decentralized plan by business-oriented managers seems to envision them as analogous to products rolling off an assembly line.

---

CTE does not belong w/ Student Affairs.

---

It is great to see so many varied student groups and activities that reflect on the amazing diversity that has evolved over the last many years.

---

I don't have any thoughts about this.

---

I have a slight concern with AHSO being moved to Student Affairs, since it is an academic office, but otherwise the plan seems fine.

---

No recommendations.

---

No Comment

---

Student affairs would be better reorganized within the Provost's office. This is a change that would make the President's office too large and complex.

---

No comments

---

My biggest concern with student affairs is the management of new student conferences and the "indoctrination" of incoming students. More faculty input is needed. Our traditions and core values are awesome, but some of the best students in the country want to hear about academics, and meet the star researchers, and there is no effort to really recruit that kind of student. In Galveston many of our students do undergraduate research, indeed in some degree programs it is even required, and yet we are not adequately emphasizing that in our recruiting materials or at our outreach to perspective students.

---

n/a

---

No comment.

---

Seems fine again as long as it does not result in more upper admins

---

i appreciated more attention on inclusion and diversity

---

Several changes are positive--for example, counseling to TAMU Health and many others. Again, most important will be the leadership in these roles.

---

I've had experience as an advisor as well as coordinating with other advisors. I strongly object to centralizing the undergraduate advising because such advisors rarely have the experience and knowledge necessary to advise specific majors. For example, I was an advisor and professor in mathematics. The advisors in general studies didn't understand that advising students to take general mathematics classes instead of engineering or science calculus limited the majors said freshman could enter. I expect there were be cost savings by centralizing the advising, but it would be detrimental to the success of the students. Please do NOT do this.

---

No comment.

---

All these seemed like good ideas to me. Particularly putting Counseling Services with TAMU Health.

---

How will the college focus on minority recruitment? What initiatives will put in place to drive recruitment/retention of minorities? What is posted is inadequate and sounds like something to pacify those that ask. This section, especially after the recent year or wo, needs to be more robust.

---

## Student Affairs - Staff

Please provide your comments related to Student Affairs:

---

I strongly approve of the recommendations for reorganizing Student Affairs. As a state institution we should make the campuses as welcoming as possible, and make it easy for students to access the many services we offer.

---

Engineering Academic and Student Affairs (EASA) needs to be split between academic advising (should be centralized with other academic advising in Provost Office) and student affairs (consolidated into the Division of Student Affairs). On its own it, the student affairs function of EASA has caused confusion related to recognized student organizations associated with engineering.

---

I disagree with the suggestion of moving the Student Health Services and Counseling and Psychology Services to TAMU Health. This should remain under Student Affairs. It is not clear to me that simply moving it to the college of its name makes any sense besides putting like with like.

---

The Money Education Center is vital to the Aggie community and it needs to be elevated in Student Affairs. This program has helped countless students understand how money works and what actions to take now to ensure future success. Financial education and literacy are important topics that aren't always accessible to students in the classroom, so having a center on campus that caters to students should be a priority for our campus.

---

Keep Psychology Services, Student Health Services, and music activities within Student Affairs. Psychology and Health should establish a resource partnership with Texas A&M Health similar to partnerships with other hospitals. A leaner Student Services allows time for the establishment of student music activities. Musical instruments and spaces to jam should be ubiquitous. A perfect space would be: A shaded pavilion with musical instruments in a vending machine. Student simply swipes ID, selects instrument, and returns when done. The public policy internship program would likely be better suited with career services or within the Bush School.

---

I do not think centralized advising would work in the way that this report suggests. I think that advisors have a very specific knowledge in their major and centralizing in my opinion would only add to advisors plate and have less specific knowledge to help students. I also think this would only help students changing their major( which in my experience is not very many students at all) reduce only one of the steps listed if that. Students would still most likely be working with an advisor and need another advisor (who handles the major they are looking into's) advice. Students will still need to consult the TAP office. Maybe it reduces traveling to offices, but students will still need several steps to accomplish this. In my experience, I've never had a change of major complain to me about the process or find it overly difficult, but I am speaking for myself.

---

Allowing students to take the lead in their own organizational management is great, but the complete lack of accountability and supervision has lead to some pretty predictable hazards. Having been in a student leader role myself for multiple years as an undergraduate, even if an organization seeks assistance/guidance from the university in addressing problem behaviors such as harassment and discrimination - there is very often no one in place to provide any meaningful sort of assistance to that end. I think the most horrifying example I am familiar with directly happened the year after I graduated, I encouraged a then-freshman to report the fact that a student leader had assaulted them in their dorm room. The assault, which took place on campus, was reported directly to the faculty advisor of the student organization. The student leader was suspended for a week, but somehow this situation wound up being resolved by the remaining student leaders holding a vote - where they chose to allow the student leader who had been reported to keep their position. The freshman who had been assaulted left TAMU less than a year later to finish their degree elsewhere. We have all heard the horror stories coming out of Fish Camp being used to groom incoming freshmen for sexual abuse, grievous bodily harm as a result of Greek life hazing rituals, etc. Even the issues raised by the SGA's bill regarding harassment of Hindu students on campus would probably be greatly aided by providing firmer guidance for our Christian student organizations - encouraging them to celebrate their faith and share in fellowship together without encouraging them to treat the non-Christian members of this campus like targets ripe for conversion. It is possible to give young leaders the space to grow and explore while still keeping some semblance of "rails" on the situation.

---

I do like all recommendations for Student Affairs.

---

I am not familiar enough with this to agree or disagree with the recommendations.

---

TAMUQ Student Affairs needs to be addressed. The department is poorly run, and this has greatly impacted the student

experience at TAMUQ. There is very little intentionality in the program, nor is there any assessment tied to programs. The Assistant Director has caused good people to leave because of their poor management. TAMUQ DSA does not build the Aggie identity in TAMUQ students. There is very little adherence to traditions, values, and culture, and this is in large part because the direction of the office.

My primary concern with this section is the lack of research done about TAMU practices. It wasn't clear how the new departments assigned to DSA will make the departments or division better. Changing the advising structure at TAMU student organizations seems more of a reaction to old army donors who want their conservative institution to retain that image than a decision in the best interest of current students. They forget that the level of control they had of their student organizations is what prepared them to run fortune 500 companies, become governors and leaders, plus thousands of other exceptional former students. The way we run student organizations is what makes our undergraduate students exceptional. The way we run the academic and research wing is how we create exceptional academic researchers. Faculty retain control over research because a student misstep can negate the process/outcome. Student organization advisors give students the reins because student leaders learn most by finding the edge of their knowledge/experience so they can see what options lie outside of their lived experience. I hope the administration talks to current students and student activities staff to get the perspective of those doing this work before deciding on this change. Their practices are informed by years of research, case law, and best practices in the field.

I'm frustrated that leadership is considering appointing a current AVP to be a Director of a department they have never been part of - especially when the Interim Director has been part of the department for 20 years, and is amazing! I love the idea of succession planning and talent management! I also firmly believe that staff in departments should at least have some input in who their director will be.

Regarding the moving of Residence Life facilities operations to the University Wide Facilities Operations (pgs 41 & 45). Residence Life having their own facilities operation is critical to the success of the on campus housing program and student satisfaction with the services provided by the Department of Residence Life. The facilities staff within Residence Life is critical to the Residence Life Operation. Residential buildings are very different than classroom buildings and need round the clock care, attention and service. They must be a priority given the building serve as a home to thousands of students. Since the consolidation and outsourcing of all custodial and maintenance staff to SSC, it has been a struggle to get close to the level of service, dedication and ownership in our buildings that was present when Residence Life had their own Maintenance and Custodial Staff. Removing the few Facilities staff we have (brought in out of need after the outsourcing to SSC) would further push Residence Life backward in the service we are able to provide to residential students. These staff are critical to ensuring building repairs, maintenance, upgrades, renovations, construction projects and deferred maintenance items are strategically planned out and accomplished. I worry that centralizing the facilities staff from Residence Life will result in a reporting situation that will not be of benefit to Residence Life or the students we serve. Special care, ownership and dedication is required around the clock to keep the homes for thousands of our students safe/secure and healthy - that is what our facilities staff do. It is unclear if the recommendation to move "Student Affairs Financial Services to Finance (pg. 41) is intended to represent the finance staff in the VPSA office alone or if it also includes Business/Finance/HR staff from Residence Life as well. As an auxiliary, our financial management and health is critical and having staff that are familiar with and understand our mission and purpose is critical. Poor management of our debt service and reserves can have devastating consequences when it comes to the maintenance and upkeep of numerous facilities. Our operation is expected to be self sustaining and we do that due to the work of good business office staff who understand our operation, what needs to be prioritized and works to get us there given their unique knowledge of our operation and business practice. It is my understanding that years ago we were under a similar system and that we suffered financially, buildings went far too long without the needed maintenance and we are still working to resolve all that to this day. Keeping our dedicated business staff is necessary for a large and complex auxiliary operation like the Department of Residence Life. We know our business and the service we provide, we are self supporting, do not rely on student fee money to operation and contribute to the University through the assessment of the Auxiliary Service Fee. Removing Student Health Services and Counseling and Psychological Services from the Division of Student Affairs is a move that risks breaking the work that has been done to collaborate as departments to get students the best care possible. I imagine this change - along with different expectations due to reporting lines changing could compromise the collaborative programming and educational efforts that have become so valuable within the division to enable us all to better serve our students holistically.

TAMU is very unique because of its traditions. TAMU should be a leader of Texas universities. Many students aspire to attend TAMU because of the traditions. Focus should be students being academically successful.

With regard to the student organization component of the Student Affairs section, I am particularly concerned at the legality of the proposed changes. In particular, First Amendment case law provides expansive freedoms to recognized student organizations at public college campuses; this does not match the more restrictive vision for behavioral expectations among campus leadership. Furthermore, we would need to exponentially expand our staffing model if we were to expand student organization expectations -- our staff is bursting at the seams right now and cannot keep up with demands from students, advisors, and administration. Lastly, I am concerned with the emphasis on "tradition" at the expense of values like diversity, equity, inclusion, and access. In other sections, the report talked about recruiting diverse students, but I found it to be lacking in its description on how to retain those students.

I have comments related to the Student Affairs marketing & communications recommendations that I am submitting in the Marketing & Communications portion of this form.

I support most of these recommendations with the exception of recommendation 3: integrate student health services and CAPS into TAMU Health. This recommendation runs counter to the majority of recommendations, which are to focus units on their core missions. Turning an academic unit into a service provider detracts from either core mission. The other student support and student life activities are all organized through Student Affairs, so separating out health and counseling services will just make things confusing for students, make relationships between student affairs professionals and the service providers themselves more distant, and distract the TAMU Health units from focusing on education.

No feedback provided

Do not understand taking apart DSA - they are national leaders in their discipline(s).

- The OPAS program is a student organization and should continue to act as one within the division where other student organizations reside

I believe that moving the OPAS area to another section of the University and leaving the MSC is a mistake. OPAS is not only a community entertainment section but also a student-run committee and a benefit to the MSC. OPAS provides money that helps promote other student areas in the Student Programs Office of the MSC. Will the OPAS student committee still be in the MSC or will the students that are also in other committees or student organizations have to move as well. I realize changes need to be made across the University but to take OPAS out of the MSC, in my opinion, is not a decision that should be made.

No comment

Recommendation 3 - To Integrate Student Health Services and CAPS, I think this is a great idea. This could help lower the stigmatization of mental health concerns for students who come from backgrounds where mental health wasn't a consideration, who now find themselves in one of the most stressful experiences of their lives so far.

I support all recommendations.

The reorganization of the student affairs would intimidate me as a student. It reads as if a student would have too many places to search for the things they need. As long as the students are given enough support to utilize all of the services offered, then a reorganization would be great. But not having one central place where the students can be shown or told where to go would be difficult.

No comments.

The #1 constituent is the student, traditional and non-traditional. The ability to engage with students early is of significance. I recognize that students are diverse in more ways than can be imagined. The orientation camps, like Fish Camp, Howdy Camp and T-Camp all have their value. Unfortunately, not all incoming students are awarded these experiences. Then, there are student-led programs, organizations and activities. I think this is a well-managed process. It can be an arduous task managing all of the student-led groups. The organization involvement offers extensive professional development and I think it is helpful to always remind students of this purpose for any organization that is allowed to exist at Texas A&M.

Student advising in my opinion has to have both college-based ("siloes," for intradisciplinary/intraprofessional advising) and broad TAMU-based (for interprofessiona/interdisciplinary advising) phases, perhaps with a central coordinating

unit.

First, the organizational chart in the report is incorrect. There is the Executive Associate VP, the AVP Dean of Students, the Associate Vice President, and the other two are Assistant Vice Presidents. The two Assistant Vice Presidents should have less in their portfolios than the other three. One of the two Assistant VP's is 75% TAMU and 25% TAMUS, therefore, that should be taken in to account for responsibilities. While I know the move of CAPS and SHS to TAMU-Health is already in progress, I am very concerned about this move. These departments play a vital role in the day to day success of students and maintain strong relationships with the Dean of Students and others on campus. It is important that the directors of CAPS and SHS have a strong connection to the Dean of Students as they triage crises on campus and support students during difficult times. I know of very few schools in the SEC and in the southeast region that have moved their CAPS and SHS outside the division of student affairs and I believe they should both remain. The movement of Music Activities out of Student Affairs at Texas A&M University does not make sense to me. Another other school, it would make sense, but not here. Music Activities has thousands of student engaged in their programs, not because they are performance majors, but because the students love what they do and enjoy the music. These students are not pursuing performance majors or music majors, but are engaged in something that they enjoy which is important for student success. Music Activities should remain in student affairs as an involvement and engagement opportunity similar to the MSC and Student Activities. The student organization portion of the report seems a bit outdated and I am unsure of where some of the information comes from. While I look forward to the transition of Fish Camp to a program, some of the other concerns about lack of oversight and accountability were new. Student organizations go through training annually and are required to have a trained advisor. Student organizations are divided into three categories: Sponsored (highest level with the most oversight), Affiliated (middle), and Recognized (lowest). Sponsored orgs have the closest affiliation with the mission of Texas A&M, Affiliated is close but less than Sponsored, and Recognized has little to no connection with the mission of TAMU. Many institutions look to Texas A&M for best practices in working with student organizations

Centralization does not always mean more efficiency. Texas A&M University is a large university that already overwhelms students. Having advisors on the department level allows students to access more specialized knowledge to make their decisions and have more thoughtful discussions about their future.

Finding #1: "TAMU Student Affairs provides a critical link to student success and the quality of the overall educational experience" (p. 41). Comments: The Division of Student Affairs is ripe with research opportunities which have not been fully accessed. There is cutting edge research that can be done relating to DEIA, sense of belonging, leadership, mental health, etc. Without an intentional collaboration, this remains untouched. We cannot continue to symbolically and structurally separate Student Affairs from Academics. It neither supports the University or students in maximizing efficiencies and effectiveness, nor does it maximize opportunities for research and publications. Recommendation #1: Reorganize Student Affairs and expand student "High Impact Practice" (HIP) services. "Integrate following units into Student Affairs from the Office of the Provost:" (p. 41) Comments: Career Services - Could be a beneficial move for students, if strategic Public Policy Internship Program - How does this align and connect with the Division of Student Affairs? As a credit-bearing internship program, how does this connect/align with the Division of Student Affairs? Money Education Center - It should be explored how this connects with the Student Organization Finance Center (SOFC) if moving to the Division of Student Affairs. If that collaboration is not explored, then the Money Education Center may be better aligned in Financial Aid. Aggie Honor System Office - How does this align and connect with the Division of Student Affairs? Student code of conduct processes are different than academic honor violations. What strategic benefit exists to bring these together? What perceptions and challenges will exist for students and other external stakeholders by bringing these areas together? Veterans Services Office - This office supports veterans in their financial endeavors. How is this connected to Student Affairs versus in Financial Aid? "Remove the following units from Student Affairs" (p. 41) Comments: University Art Galleries - Encourage a review of their current space. How is it being maximized and utilized? Are there other areas that have a greater need for some space in the MSC? Music Activities - Currently perceived as being "owned" by the Corps of Cadets. This move could provide more access to a larger audience, creating many benefits for the arts. Becky Gates Children's Center - Encourage a review of financials to ensure sustainability. The Division of Student Affairs currently provides funding support in order to keep costs as low as possible for accessibility purposes. Information Technology - see feedback in the Information Technology section. With the current centralized IT model in the Division of Student Affairs, Departments are not able to be served in a timely manner to meet the needs of our stakeholders - particularly given that we are in a rapidly changing time of technology. I am concerned that we will

see longer delays and decreased services, which would cripple our ability to provide timely, efficient, and intentional technological support to students, parents, former students, and other stakeholders including the over 1,100 recognized student organizations. Student Affairs Communications - see feedback in the Marketing & Communications section. Student Affairs Financial Services - see feedback in the Finance and Business Administration section. Student Affairs Human Resources - see Human Resources and Organizational Effectiveness section. Student Housing, Memorial Student Center, and University Center facilities - see Facilities section. Counseling and Psychological Services - CAPS has provided their own feedback. Student Health Services - SHS has provided their own feedback. Finding: #2 "During the review phase of this work, student organizations and student conference functions regularly were a point of concern. Student organization and student conferences hold a reputation of little student accountability, little university control, and of being a risk to the university. This risk is associated with financial management, lack of training, and the selection of student conference curricula and activities" (p. 45). Questions & Comments: What is meant by student conferences? Texas A&M has New Student Conferences (Offices of the Dean of Student Life) and student conferences (primarily in the MSC). There are also Extended Orientation programs (like Fish Camp, Howdy Camp, T-Camp, and Venture Camp). Clarity is necessary in understanding what is meant by "student organizations and student conference functions (p. 45). If the report is referencing Fish Camp, then that should have been stated directly, rather than bringing in the other 1,100 student organizations, New Student Conferences, and MSC Conferences. Consider looking at the language and structure used at Texas A&M around NSCs and Extended Orientation (EO) programs. Perhaps we consider having a more consistent naming process, so it is less confusing for our students. Rather than NSCs and EO, why not put them all together (under New Student and Family Programs or similar). The current model has EO programs like Fish Camp, Howdy Camp, T-Camp, and Venture Camp in Student Activities, while NSCs are under New Student and Family Programs. Many of the conferences fall under the MSC, Student Activities, and Multicultural Services. If there is concern with "financial management, lack of training, and the selection of student conference curricular and activities," what resources will the University commit to provide to the Division of Student Affairs and Department of Student Activities (SACT)? Context: SACT has requested a new position for Fish Camp for the past five (5) years, and still does not have a position. SACT has requested an instructional designer to enhance student organization training for the past two (2) years, and has not received a position. SACT has requested a position in our Student Organization Development & Administration (SODA) area, of which there are only four (4) FTEs to support the recognition, training, risk management, travel, insurance, etc. for over 1,100 recognized student organizations. The University does not provide financial support to Fish Camp (except for 1.5 advising positions), the rest is raised by Fish Camp (Fish Camp is a million dollar endeavor - is the University prepared to provide financial support? Personnel support? etc?). Lastly, SACT also houses the Leadership & Service Center (LSC). Due to budget reductions from the University, this area lost a FTE, reducing the opportunity for the LSC to provide additional trainings, as well. Resources are NECESSARY in order to provide enhanced financial management, training, and curriculum development support. Lastly, it would behoove the University administration to understand what current initiatives DO exist around financial management, training, and curriculum. Sadly, there is a lack of understanding regarding these services, which can be seen from the statement "Student organization and student conferences hold a reputation of little student accountability, little university control, and of being a risk to the university" (p. 45). Financial management: What financial management concerns exist that need to be addressed? Is the concern revolved around fundraising? If so, then this should be explicitly stated. If it does revolve around fundraising, then consider the number of Development officers for the Division of Student Affairs, you will see that there are too few people considering VRSC and the Corps have their own Development officers, but the rest of the Division has to share two development officers. Perhaps look at this model, as student organizations have significant fundraising potential, and have largely been untapped (including fraternity and sorority life). Are there are other financial concerns that exist? Lack of training: There are over 1,100 recognized student organizations at Texas A&M. Each of these organizations is required to remain current on their training. There is a training center where ANYONE can take training, but it is required annually for the chief student leader, treasurer, and advisor. Currently, there are twelve (12) training modules for advisors and fourteen (14) training modules for student organizations. The Department of Student Activities has put in a request for the past two years to hire an Instructional Designer to bolster trainings. This request has not been approved. An Instructional Designer can add training opportunities for our large recognized student organization population, but we do not need the resources in order to make this happen. What are the training concerns that exist beyond not having enough staffing and resources? What commitment is the University ready to make in order to close the gap? Selection of student conference curricula and activities What student conferences are being referenced here? What curricula in student conferences is of concern? What activities are of concern? In order to

make changes, additional perspective is needed. Questions & Comments: We should expect that a consulting firm have access to resources and references that are more current than 2007 and 2008. Placing outdated references that only connect with a perceived direction is not conducive to identifying a solution that has been vetted by experts and sustainable. Below in general feedback includes resources and research that is more current on the topic. Recognizing the expertise of staff is critical - as well as understanding context. If context had been sought, the consulting team would know that: The Department of Student Activities is well-versed in student engagement, has multiple research-practitioner-scholars, connections and research practices with faculty, reviewed the relationship between the University and student organizations, created a document providing an overview of the rights and responsibilities of student organizations vetted by the Office of General Counsel, reviewed the Facilitator University philosophy that A&M has adopted, and regularly reviews advising assignments, surveys the 1,100 organizations, updates training, etc. Currently, Student Activities is developing an MOU with recognized student organizations and revamping the current three tiered system. Where is this identified in the report, though? Recommendation #2: Align student organization management practices to ensure transparency and accountability. "This effort may include a staff-led best practice review of student organization management to implement an updated model for facilitating and orchestrating the relationship between student organizations and the university. This updated model should ensure that student organizations are held to a high standard that is in line with professional TAMU expectations of conduct, financial management, and upholding the Aggie Core Values" (p. 46). Questions & Comments: Recognizing the expertise of the staff at the University is critical - as well as understanding context. If context had been sought, the consulting team would know that: The Department of Student Activities is well-versed in student engagement, has multiple research-practitioner-scholars, connections and research practices with faculty, reviewed the relationship between the University and student organizations, created a document providing an overview of the rights and responsibilities of student organizations vetted by the Office of General Counsel, reviewed the Facilitator University philosophy that A&M has adopted, and regularly reviews advising assignments, surveys the 1,100 organizations, updates training, etc. Currently, Student Activities is developing an MOU with recognized student organizations and revamping the current three tiered system. Where is this identified in the report, though? Rationale #2 "Student organization management is often viewed in two philosophical ways. The first philosophy is that student organizations should have the freedom to explore the campus, make mistakes at almost any cost, and create, manage, and implement programs and activities as they desire while upholding some fundamental institutional guidelines. The second philosophy is that student organizations should be strategically designed to provide leadership development and accountability opportunities. The skills gained through holding student leaders to more stringent guidelines foster decision-making skills and understanding of how to lead an organization within the context of a larger organization, how to deal with conflict, and how to manage finances. As institutions of higher learning are responsible for developing career-ready citizens, the second model offers the most significant benefit to students. Establishing student organizations as semi-professional entities with structured guidelines and expectations allows students to understand the reality of most post-college professional settings while enjoying shared interests with other students" (p. 47). Questions & Comments: Where is the reference for these two philosophical views? Having worked at five (5) universities over the course of 15 years, I know there are actually multiple philosophical views, and only two are referenced in the report... Texas A&M significantly changed the RSO model after the collapse of Bonfire in 1999. Texas A&M became and continues to be a model of "shared responsibility." In fact, the Department of Student Activities mission statement reads, "The Department of Student Activities fosters and supports leadership, learning, and involvement opportunities that enhance the growth and development of students and recognized student organizations. As members of the university community, we are committed to a philosophy of shared responsibility that develops leaders of character dedicated to serving the greater good, and we subscribe to the Texas A&M core values of Respect, Excellence, Leadership, Loyalty, Integrity, and Selfless Service" (<https://studentactivities.tamu.edu/about-us/>). The Department of Student Activities is well-versed in student engagement, has multiple research-practitioner-scholars, connections and research practices with faculty, reviewed the relationship between the University and student organizations, created a document providing an overview of the rights and responsibilities of student organizations vetted by the Office of General Counsel, reviewed the Facilitator University philosophy that A&M has adopted, and regularly reviews advising assignments, surveys the 1,100 organizations, updates training, etc. Currently, Student Activities is developing an MOU with recognized student organizations and revamping the current three tiered system. Where is this identified in the report, though? "The value of infusing HIPs into Student Affairs via first-year orientation programming and learning communities for incoming students is well-documented. Evaluating student orientation programming, including Fish Camp, to ensure an adequate balance of student involvement and institutional staff

oversight is critical to future program success. Student orientation programming is just one HIP that can lead to positive outcomes for student engagement and persistence in higher education. TAMU Fish Camp holds much value for incoming freshmen in helping them develop an affiliation with the university, gain concrete knowledge about institutional practices and policies, and engage with other students. Such student engagement practices for incoming students prepare them navigate co-curricular experiences and challenges throughout their college career. It is important to balance student autonomy with institutional oversight, such that TAMU's values and traditions remain central, when helping to shape programmatic elements. This balance will allow the students opportunities to learn and develop while also staying in bounds in terms of what aligns with the institution's priorities and mission. Overarching Questions & Comments: The Vice President for Student Affairs position was posted on 11/9 with a deadline of 11/18. From my understanding, no communication went out to the Division of Student Affairs alerting them that the position was open. High-Level SWOT Analysis "Strengths - The Aggie culture presents a foundation of shared traditions and values that create a cohesive identity for students, staff, and faculty. The Corps of Cadets is a part of the school's culture and student body" (p. 109). Greatest strength is greatest weakness, as this report also indicates. While the culture can be a strength, it has been identified in many different surveys provided by the University (campus culture, SERU, etc) that many students do not see themselves identify with the culture. They also do not see themselves identify with the Corps of Cadets either, and see that the Corps of Cadets has different expectations than other areas of campus (conduct process, student organization process, etc.). Weaknesses - "Limited financial resources to recruit and retain talented faculty and staff. Not competitive enough with the marketplace" (p. 109). In a benchmarking study, it was identified that College Station Independent School District entry level positions begin \$10,000 higher than entry level positions at Texas A&M University. "The Aggie culture impinges upon the potential for change within the university. The notion of an all-male, military component of the school impinges upon the culture of higher education" (p. 109). There should be a review of culture, tradition, and values. Including a review of the Corps of Cadets. "Student Affairs is unorganized, does not oversee all of the correct functions, and could be improved with restructure" (p. 109). Unorganized? As evidenced by what? Threats - "University climate not always welcoming, particularly to diverse faculty, staff, and students. Enrollment of diverse students, particularly African Americans, is low. Student and faculty populations do not reflect the state population" (p. 110). "Perception that TAMU history and culture have negatively impacted student body diversity. TAMU has historically been conservative and slow to change regarding diversity issues. Fish Camp is an example of this - there is a lack of control over the content of the camp. The challenges of polarized politics have the potential to threaten core values" (p. 111). If research had been gathered, there would have been an awareness that Fish Camp actually had diversity as one of its values, but they were told to change their values by the Office of the Vice President for Student Affairs to the University values in August 2021. I'm not certain how the reference to "lack of control over the content of camp" relates to "conservative and slow to change regarding diversity issues" and the tie-in to "Fish Camp is an example of this." As mentioned, Fish Camp had the core value of diversity, and was told to remove it. They had a diversity program, and were told to change it by the Office of the Vice President for Student Affairs in August 2021. They were also told to not talk about identity, because that's not the purpose of Fish Camp. Fish Camp has continuously tried to enhance their diversity efforts, and it is, unfortunately, the University that has prevented diversity initiatives from being either carried forward or implemented. I do agree that "polarized politics have the potential to threaten core values", but what is meant by this exactly? I actually am unclear on what the meaning behind the core values of the University are...Perhaps it is time for the University to be bold enough to adopt diversity as a core value.

---

I agree with integrating the suggested units to Student Affairs. I disagree with removing each of the suggested units from Student Affairs (excluding Counseling and Psychology Services and Student Health Services). These areas have strong student involvement and student-focused operations. Because of this, it does not make sense to remove these from Student Affairs.

---

The concept of integrating CAPS and SHS whether or not they are moved into TAMU Health makes a lot of sense. The two often overlap and having a one-stop shop for student health would be highly beneficial to the student body.

---

Expanding HIP services sounds like a great idea and a highly positive thing for students. IT at Student Affairs is rather advanced compared to other IT with respects to ITIL. I would think that we should keep DoIT as together as possible. Moving Student Health Services makes sense.

---

As a former student, mental health services were hard enough to access while under the umbrella of Student Affairs. Further medicalizing counseling and moving it to the Health Sciences will just mean that fewer students will be able to access it. But if it enables longer-term counseling and a more holistic approach to students' health and well-being, that could be a good trade-off. More transparency from student organizations is a good suggestion and I would be

interested to see how the university will implement it

---

I think EIS, although IT, should remain with Student Affairs. We house student data, and work closely with the office of REGI, ADMI, FAID, and SBS for the purpose of enhancing student experience.

---

None

---

I do think moving student health services makes sense.

---

Both health services and student counseling are within the student affairs umbrella in Galveston. Health services is handled with an interagency agreement with UTMB. How will rolling these two services into Texas A&M Health roll out in Galveston, which has no direct connections to Texas A&M Health? As with any service, local avenues must be available for students and parents to ask questions.

---

I agree with two of the three initiatives outlined in this section. The first finding to add/relocate units is what I take issue with. For example, money education should remain with financial aid as educating students on money matters is not the mission of student affairs. Student Affairs is about providing a holistic approach to student support. The provost focuses on academics and Student Affairs focuses on the mental, emotional, and social health of the students. Student Affairs does critical work during a time when students are transitioning into independent adulthood. By adding things like money education to the purview of student affairs, you begin to dilute this mission. When students think of money issues, they think they need to go to Financial Aid. Let the money education stay where the students' funding is located, in Financial aid. I have mentioned in a previous comment that some of the areas that are being reassigned to academic and strategic partnerships don't make sense and should remain in student affairs until a more appropriate home is found. The music activities, art galleries, etc, should stay until the creation of the School of Visual and Performing Arts is established then they should transition to this unit. The current proposal feels like change for the sake of change.

---

None at this time

---

I can see efficiencies in the proposed re-org.

---

I personally have worked for the Money Education Center for over half a decade and I fully support it going to Student Affairs to be better supported. In spring 2016, our assistant director was given authorization to fill seven to eight full-time positions. We have never actually had more than four full-time staff members (three advisors). We have served over 32,000 Aggies throughout this time. Instead of growing us to help more Aggies, we have been minimized. One of our positions was taken away from us in July. We now have three team members. We are all slated to begin working as Aggie One Stop Advisors in December. We have been repurposed. If the Money Education Center is believed to be a "High Impact Practice" (HIP), then I promise you the Aggie One Stop will not allow us to grow, live up to the TAMU core values, or prepare students with the "college knowledge" that this report views as necessary. There will be push back about us. Those people are the same ones that have controlled us for the last three years. One of them even went to the White House on our behalf. Yes mam, the Money Education Center was invited by the White House to be recognized for our efforts on financial literacy and we were told by higher ups we could not travel or take vacation to attend this event. It would not be "fair" for us to get more travel opportunities than other teams. I cannot begin to tell you how many ways we could better support our students if we could be supported adequately. We will lose our website in a month and will be moving to the GSC. I have a PIN and I am going to fill a hole at the Aggie One Stop. This report views us as foundational knowledge for college students, but we have been treated like a non-essential optional service. Those "workshops, resources, and one-on-one financial consultations" will not happen where we are headed. I just pray you chose growth over minimizing Money Education.

---

How can student housing and the MSC NOT be considered part of Student Affairs? Yes, student orgs need more transparency and guidance, but please leave everything else alone.

---

It is being recommended to move the Becky Gates Children's Center out of the Division of Student Affairs and to the Office of the Vice President for Academic and Strategic Collaborations although approximately 35% of campus child care centers are under the Division of Student Affairs and 35% are under an Academic Department, while 10% are in Administration & Finance Divisions (National Coalition for Campus Child Care Centers, 2015). The Becky Gates Children's Center presently has many established collaborations and partnerships across campus including College of Nursing (clinical site), College of Architecture, College of Education & Human Development Project ABC (T3 Grant) & NIH Grant application, College of Engineering (NSF Grant application), College of Medicine, and others. Changing divisions impacts

agreements and affiliations. Consider supporting and maintaining established collaborations and affiliation agreements when moving departments with new reporting structures. The mission of the Becky Gates Children's Center is to provide an exemplary, affordable, accessible early childhood program for the children of the students, faculty and staff affiliated with Texas A&M University. The Becky Gates Children's Center mission is met by serving students, faculty, and staff at TAMU. The center supports student engagement through transformational learning experiences by using the center as a research, clinical, and observation site as well as providing high impact opportunities for over 50 student employees. The Becky Gates Children's Center supports both undergraduate and graduate student parents in achieving academic outcomes and by increasing graduation rates. Being student focused is at the core of the center's mission. If the Becky Gates Children's Center is moved out of the Division of Student Affairs, we ask you uphold their mission and allow them to continue to positively impact all students at Texas A&M University. In continuing with the mission of the Becky Gates Children's Center the new Office of the Vice President for Academic and Strategic Collaborations addresses the goal of "collaborating and connecting with the larger Bryan-College Station community and the citizens and communication across Texas" and aiming to "prioritize relationships between TAMU and Texas, particularly the communities where TAMU campuses and programs reside" (p. 19). At this time, it is unsure how the Becky Gates Children's Center aligns with the Office of the Vice President for Academic and Strategic Collaborations. The Becky Gates Children's Center has focused internally for over 20 years on the faculty, students, and staff of TAMU. Consider safeguarding the current mission of the center. Campus Child Care Centers such as the Becky Gates Children's Center enrich higher education institutions by supporting a diverse and inclusive body. The center supports academic partnerships and campus-wide collaborations across all disciplines. The center supports a world class faculty and staff by increasing recruitment and retention, being a family friendly environment, and fostering inclusivity with our rich diversity. Many Aggies find a home at the Becky Gates Children's Center. In addition, the Becky Gates Children's Center has obtained outstanding achievement in national and state quality initiatives including health and wellness as well as the new nature-based playground. The center also offers quality educational training opportunities for students, faculty, and staff as well as in-service and pre-service teachers. This center is and should continue to be model school for early childhood education across the state of Texas and beyond. It is imperative to uphold the mission of the Becky Gates Children's Center to provide an exemplary program. This is accomplished through the center's innovation and discovery by leading in child-centered philosophies and pedagogies, including nature-based and anti-bias education, opening the gates to a lifetime of learning for both our future and current Aggies. Lastly, the Becky Gates Children's Center receives important funding from the Division of Student Affairs for Aggie student parents. The center awards \$78,000 annually in DSA UAF funds to student parents. Active student parents receive between \$100-\$175 monthly discount to offset the cost of child care to support student parents' focus on their academic work and graduation. Furthermore, the Becky Gates Children's Center receives \$24,000 annually in scholarship money from The Association of Former Students specifically for lower socioeconomic status graduate students. Continuing funding streams that support Aggie students is imperative to the mission of the Becky Gates Children's Center.

---

I find it curious that the report focuses the programmatic efforts of the Department of Student Activities but does not mention programming efforts by the Memorial Student Union.

---

No comment

---

Finding #2: I do agree that student organizations need more accountability and more university control. I also believe that currently Freshman Leadership Orgs, Sophomore Leadership Orgs, etc. divide Aggies rather than unite Aggies. They've become lots of little separate groups (similar to sororities and fraternities) that students have to apply to become part of. That isn't the Aggie way, and it makes me sad to see that A&M has become this model of hierarchy that makes fellow Aggies feel excluded.

---

While I can understand the desire to centralize services that are offered through DSA, I worry about staff capacity in those areas, even if staff were to "move" to their new respective organizations. Also, it feels as though you could utilize a 5th AVP in the VP Office to help alleviate some of workload currently on those staff members.

---

I do not think CAPS and SHS should be removed from Student Affairs. They are student services, not academic/research initiatives.

---

I have never been a student at A&M but the students I asked need academic advising tied to their individual department.

---

I support the suggestions in the report

My comments are similar on this section as on the Provost Office section; I completely agree with moving any functions that are squarely in the realm of Information Technology to be a direct part of the University's Information Technology organization. Anytime this type of IT consolidation is done there is much more hard and soft savings realized than was originally thought. As well, the depth and breadth of service capabilities instantly increases. The closer we can get to a "One Team" feeling and reality with TAMU-wide IT, the more effective and efficient we can get for the organization and the TAMU community and the more growth opportunities we can offer IT professionals and those interested in entering the IT field.

---

I concur with the recommendations of the study

---

Student Affairs is made up of many unique departments that serve students in a wide variety of ways. DSA IT was created to serve these highly varied departments and cater to their specific needs so that they can provide high quality service to the people they support. While I believe many support the continued consolidation of IT services to improve quality and lower cost I believe it must be taken one step at a time so that no department's ability to serve students is effected. Like a space ship being carefully and slowly moved to the launch pad; if DSA IT services are to be consolidated, they need to be slowly and methodically moved with enough time and care so that the customer isn't affected. If this is done too quickly, or if personnel not familiar with the services take over, it could all cause headaches for all involved.

---

Agree with Recommendations.

---

Centralizing IT services is a great concern because typically the more centralized operations get, the lower quality of service customers (departments) get. Departmental IT projects, which are already consolidated within the Division, will be added to an even longer prioritized project lists if further centralized to TAMU IT. As an auxiliary, Residence Life is directly competing with off-campus housing options that students have which require us to quickly evolve and change to compete. Being told that we have to wait in line for our RFC (Request For Change) to kick start, or placed far in the future on a roadmap, puts our department in a precarious position where it's harder to compete and harder to implement important system updates that affect business processes. Also.....we're hearing rumors that AWL (Alternate Work Location) or "working from home" will be going away. Although this makes sense for many positions, IT in particular is work that can very effectively be done working remotely. This has been proven in the last almost 2yrs of Covid restrictions....and even before Covid, this was a common practice in many institutions particularly for IT. Instead, I would suggest making working from home even more accessible for IT personnel to keep hard to find skills on campus to service our customers like they deserve.

None

---

Music Activities perfectly aligns with the report's positive aspects of Student Affairs and already aligns with the recommendations for areas the report found weaknesses in Student Affairs. Based on the report findings, Music Activities should be held as an example of what a Student Affairs program should be, not removed from it. The below are examples. Student Affairs Recommendation to Expand Student High Impact Practice – The activities of the ensembles of Music Activities have been recognized as HIP for over 10 years. From HIP Criteria – Student Leader Learning Outcomes • Students invest time and effort in purposeful tasks. • Students are constantly engaged in completing musical tasks while in rehearsal with each other to achieve the highest level of performance possible • The Music Activities Center allows for students to utilize time to perfect individual performance with practice and rehearsal facilities • Students interact with staff, advisors, and peers about substantive matters usually over extended periods of time. • Student ensembles are led by professional music educators (directors) with several years of teaching experience both at the secondary and collegiate level • Directors supervise and advise student groups within Music Activities throughout the academic year • Students experience diversity through contact with people who are different from themselves. • Students that participate in ensembles closely resembles the population of A&M. Students of various backgrounds interact and collaborate with each other frequently in rehearsal and performance • Students get frequent feedback about their performance – almost continuously – in settings that allow them to respond to that feedback. • Directors offer feedback both in rehearsal and performance consistently throughout instructional time • Directors offer recordings for both self and group evaluation therefore providing the tools necessary for improvement in future

rehearsals and performances Music Activities fulfillment of report recommendation for Student Affairs: Integrating services that facilitate student's academic and career success Skills valued by employers cultivated in Music Activities Leadership training Communication Teamwork Responsibility Accountability Higher order thinking skills Examples of career/academic success: Repeated reports of student acceptance to medical school being largely contributed to The school's interest in the student's music experience. GPRs of Music Activities Students consistently higher than University as a whole Organizations being in balance with academics -Students receive academic credit for ensemble participation through Performance Studies. Philosophical Models – Autonomy vs. Oversight balance – Student Affairs Strength Weakness Analysis Music Activities offers student leadership opportunities in various forms of officers, section leaders etc... however they are all with a very structured, professional staff overseen environment in all aspects. The ensembles are classes with a professional teacher (director) with complete oversight for each ensemble. The student leadership is within that classroom structure. Student Affairs will play a critical role in the development of the whole student Music Activities allow students to grow in artistic and cultural ways otherwise not available in their majors. The main purpose of Music Activities is not outreach. The main purpose is student education and experiences through music. While Music Activities does represent the university in a myriad of ways, any outreach is an outgrowth of the main purpose, which is fully centered around the student experience. All MUSA students receive academic credit for any music ensemble in which they are involved. Student Affairs recently spent \$42.5 million (including \$10 million plus from multiple VPSA donors) for the Music Activities Center, which was constructed specifically to allow all music ensembles to function together as one department. Functioning as one department is the main reason for the current level of success. The staff, budget, and facility enjoy success at the highest level, due to the current supervision structure and department setup. Any change would make things less efficient, thus setting up an environment that could lessen student success. The complete MUSA staff functions as one unit, allowing student and administrative support for all ensembles at the highest level. It is of vital importance for the MUSA staff to have experiences with multiple student groups.

---

I agree with the recommendations here, the decline of Fish Camp is an example of a loss of focus on Texas A&M's core values.

---

I believe the Veteran Services Office (VSO) should be a part of Student Affairs (Veterans Resource Office)...this is good idea especially if the existing reports, imaging system, Compass screens and IT support is available to VSO. The \$ which generate these reports and services through Financial Aid would need to be a part of the Veteran Services Office budget. I would also like to suggest Hazlewood and TASSP remain with Student Financial Aid since this is a State and loan benefits which need to be processed through Financial Aid.

---

This realignment doesn't quite do it for me. Moving Marketing, Business, HR, and IT does make sense. But really, the division should be split into Student Affairs (with student programs, the offices from the provost, the corps of cadets, veteran programs, and Music Activities) And the other offices (Housing, Rec sports, Becky Gates Children's Center, and possibly transportation) should be organized into Student Services.

---

I agree with the proposed restructuring.

---

I think that Student Affairs at TAMU is and has been a model for the nation for quite some time. I would hope that these proposed changes are well thought out, and will keep TAMU at the forefront of Student Affairs. I am confused by some of the language used as to what portions of departments are being kept in Student Affairs and what is leaving in some departments.

---

I personally agree that some areas of student activity that are just run by students (FISH camp) need more oversight, considering the harassment that has been happening over the years. I have read comments from students about this section of the MGT report and they don't seem to understand the seriousness of these kind of issues/don't see that this would be a reason for more oversight. Even though TAMU wouldn't want to point out its own flaws, when making the case to students that they need more student org oversight, you will REALLY have to say out loud the issues that have been happening to/with students, so they get that this isn't you wanting to take toys away, it is TAMU wanting to prevent assault.

---

(n/a; we are not a directly student-facing unit)

---

Interesting that the most recent literature that was used to justify a move to have more university-controlled student organizations and activities is 13 years old. Had more recent literature been used (examples below), it would have been noted that the model we currently use - the Facilitator Model - allows for a balance of student learning and student accountability. Additionally, the report seems to single out the Corps of Cadets as if they are not included in

(what the report has defined as) the "problem" of student organizations. While the Corps may be an important part of Texas A&M's rich history, the Corps is no longer representative of the student experience at A&M. Our fraternity and sorority community has over 3x as many members as the Corps, our student government is more diverse and representative than the Corps, and our extended orientation programs prepare students for the reality of Aggieland - interacting with students with differing backgrounds, experiences, and perspectives - while the Corps values uniformity, unwavering loyalty (even when activities and practices impact mental health, physical well-being, and emotional suppression). In a recent visit with professional staff in the Corps, it was revealed that there is only an 82% participant retention rate from first to second year, whereas Fish Camp, a student-led, student-run program, has a participant retention rate of 97% from first to second year (longitudinal retention data for Fish Camp is available). Finally, the US constitution and case law like *Healy v. James* (1972) afford student organizations many rights and responsibilities. The report calls for blatant impediment of those rights as well as diminishing the concept of the university as a "marketplace of ideas" which student organizations help foster. Student organizations are not required to agree with Texas A&M or espouse Texas A&M values or support Texas A&M traditions, especially those values and traditions that perpetuate white, heterosexual, Christian, and male experiences that were relevant 100 or 50 years ago. Our students have changed and the university must change with it. The most important role of student affairs is NOT to uphold tradition. It is to facilitate student learning, build life-long skills and competencies, and provide co-curricular experiences that expose our students to issues they will face in the "real world." Based on the report's assessment of student affairs, Texas A&M is no longer operating in the real world - they are trying to recreate a world that existed long ago and is no longer relevant to the students and their needs of today. Lake, P. F. (2013). *The rights and responsibilities of the modern university: The rise of the facilitator university*. Durham, NC, USA:: Carolina Academic Press. Rosch, D. M., & Collins, J. D. (2017). The significance of student organizations to leadership development. *New directions for student leadership*, 2017(155), 9-19. Sessa, V. I., Alonso, N., Farago, P., Schettino, G., Tacchi, K., & Bragger, J. D. (2017). Student organizations as avenues for leader learning and development. *New directions for student leadership*, 2017(155), 21-32.

---

NA

I completely believe that our student groups need some re-direction. I think a complete overhaul of that process could be extremely beneficial AND an in-depth look at what organizations exist could be extremely beneficial. I have not been convinced we need 1,000+ organizations for quite some time.

I'm concerned about the recommendations around Diversity and Inclusion efforts in the executive summary. There are many ways we can support the "whole" student, especially when each student has different needs depending on their cultural identity(ies). If some faculty and staff think this programming is a waste of resources, then perhaps that underscores the need for improved diversity, equity, inclusion, and access professional development training throughout the system. I believe recruitment of students and hiring of faculty and staff from diverse identities would improve if more faculty and staff were further educated on this topic. Student Affairs is doing amazing work on the Galveston Campus, and I would hate to see those efforts weakened in any way.

I am very confused and concerned about the movement of Financial and HR services to be under the general campus wide areas. As a staff member who works in a business office in Student Affairs and does both HR and Finance duties, I am not sure where that leaves me and my department. It feels as though we will be siloed further into specific job duties and forced to pick one side instead of being able to work with our strengths as a unit and figure out how to best divide the related tasks. It also feels like it would create a lot of confusion about reporting structure and how we will continue to support programing and other areas. It is not clear if our duties will change and I cannot imagine a situation in which the daily work stays the same under the consolidation. If we are to be reporting via both a dotted line and solid line, it feels like there could be competing priorities and confusion around where loyalty lies.

In reassigning degree programs to other colleges, those in their current degree programs should be grandfathered in. My son is getting a University Studies degree within the School of Architecture. He applied to the School of Architecture and was accepted to that school. He has his reasons for pursuing the degree that he's chosen and would not have applied to the School of Architecture if that isn't where he wanted to be, having turned down acceptance to other architecture programs at other colleges. I know that he and I would find it very upsetting to see him bumped to the College of Arts and Sciences. Any reorganization should start with incoming students and not disrupt already established students and their degree plans.

I don't work with Student Affairs to provide feedback.

While the idea of re-organizing student organizations and helping them be more purposeful and developmental students is a good one. The cost of training, time, and extra duties to staff are high. Staff members would need to be trained on advising, they would need duties to rearrange or have duties taken off their workload altogether.

I feel the Veterans Service Office should remain as-is. Veteran students have unique experiences and unique needs that are best served by a veteran-specific entity with a sole purpose of assisting veterans. Texas A&M's approach to assisting veteran students is well-known, and the existence of the VSO overtly shows how TAMU cares for and supports its student veteran population. I'm afraid moving the VSO under student affairs significantly takes away from that, and will erode, or at the very least, dilute that important message.

The BIMS program needs to stay where it is. I was part of it, and work with many current students, and can tell you it is successful BECAUSE it is part of the vet school. It allows for an integrative program from undergraduate to professional students and research that gets and keeps students focus and interest on reaching their goals in a professional medical degree. The work they do with the veterinary hospital and research directly translates to work in human medicine also. The opportunities draw in and keep students on the track and successful. If realignment needs to happen, then move the ENTIRE veterinary program to the medical school. Don't cut the legs out of it and remove the most successful part. It will not continue to enjoy the same level of success if decoupled from the biomedical programs of either veterinary or human medicine.

Reporting structure is a big question when it comes to how department operations fit into the centralized process and who gets to set priorities, approve funding, etc.. Several department positions noted in the report provide more than just business functions, marketing functions, facility functions, etc. Trying to split out all these responsibilities will be challenging and someone still needs to perform the work. If they provide more than one function (ie. HR and business) where does that person go and who makes that decision. Communication and Collaboration is important and pulling everyone out from departments will impact negatively impact the effectiveness of the operation. There are also several departments, for example, the Becky Gates Children Center that provides scholarships to students which is funded by the division, where will the support come from if it is to continue. There are other examples within the division that have division support to enable them to operate.

Counseling services should absolutely move to Health Services Center. Too often we see that students cannot get the counseling services that they need in the timely manner than they need it. This is an issue that must be fixed immediately. We have students who need an appointment who cannot get one for 2-3 weeks. That is unacceptable. If these movements occur, please do not make these changes through Reduction In Force then having people reapply to the newly centralized positions. We have seen this in the past and it has cause severe consequences, to include but not limited to: loss in trust between employee and employer; poor mental and physical health of not only RIF'ed employees but the supervisors who had to inform the employees; low morale; and overall bad reputation.

In the Student Affairs section, I am concerned about your recommendations, "grounded in best practice and the student affairs research literature" (p. 40) when most of your own citations are a decade old or older. I do degree that the Division "provides a critical link to student success and the quality of the overall educational experience" (p. 40) On page 40, you note the ACPA/NASPA Competencies, which you seem to relate to "organizational design and structure of the student affairs function to achieve improved performance." The Competencies actually are functional area neutral: "The 10 professional competency areas presented in this document lay out essential knowledge, skills, and dispositions expected of all student affairs educators, regardless of functional area or specialization within the field" (p. 7, 2015). Using the Competencies as a rationale for reorganizing operational and service functions is unwarranted. When you talk about "High Impact Practice" services (p. 41), are you talking about the work of Kuh and others who focus on activities such as learning communities, service learning, etc.? I think high impact "services" can be very different than high impact practices (HIPs)/transformational learning experiences. Finley (2019) reiterated the work of Kuh and others that HIPs require high performance standards, a significant investment of time and effort over an extended period, interactions with others about substantive matters, experiences with diversity, frequent and timely feedback, opportunities for reflection, real world application, and demonstration of competence. Services, in my interpretation, provide more of a transactional experience (although some can be very meaningful), rather than a continued relationship for student learning and development to accomplish specific learning outcomes. Study abroad, first-year experiences, and undergraduate research are typically considered HIPs, although you did not cite any consideration of whether to move them into Student Affairs. On page 44, it appears that you are relating college knowledge

(admissions, financial aid, academic requirements) with HIPs as cited in Kilgo, Ezell Sheets, and Pacarella (2015). The purpose of their article was to “examine the relationships between high-impact practices and liberal arts educational outcomes” (p. 512) to know if there is a connection between nine types of HIPs and learning domains (critical thinking, moral reasoning, etc.). From what I glean from their article, they did not look at the college knowledge variables you suggest. In addition, first-year seminars and academic learning communities, where students might get that college knowledge, were not “significant predictors of any of the liberal arts educational outcomes” (p. 521). The Money Education Center certainly could/should increase financial literacy, but I’m not sure that pulling it out of Scholarships and Financial Aid is helpful to students without additional evidence. Was there consideration of moving all of Scholarships and Financial Aid back into the Division of Student Affairs, particularly if lack of financial aid/student finances can be a barrier to continued enrollment. The Scholarships and Financial Aid Office will shrink as you move areas out of that department. I am concerned about Student Health Services (SHS) and Counseling and Psychological Services (CAPS) moving out of the Division of Student Affairs. CAPS and SHS provide direct service to students, so they can be successful academically, physically, and emotionally, thereby “enhancing their experience” (p. 40). They are closely connected to other areas in the Division of Student Affairs which creates collaboration. I have some concerns about having them report to an academic program, which may, over time, change their priorities and funding. When you recommend moving CAPS and SHS to the Health Science Center “to provide additional access to a larger network of physical and mental health resources” (p. 45), are you referring to resources for the departments or resources to students? Page 48 indicates that additional medical personnel will be provided during high demand periods. Are those going to be new hires, or will you be asking current HSC faculty/staff to increase their workload? Where will they be housed physically, since Beutel and Student Services Building seem to be full? On pages 109 and 111, the report indicates that the Division of Student Affairs is “unorganized,” and without further clarification, I would not agree with that. Did you explore why the current departments are in the Division as part of the context for the recommendations? I do agree that there could be a review of departments that should be in the Division. While I agree that one of the most important roles is to “uphold tradition” (p. 111), I think that undersells the value of the Division in enhancing the student experience and supporting the goal of student success. Having SHS and CAPS in the Division is one example of improving student success. In particular, the Division provides applied learning, leadership, and engagement opportunities that helps students develop skills that future employers are looking for. There are always opportunities for increased training and development with students. I also think we have to pay attention to higher education case law, so that we are not at risk of lawsuits.

---

Finding#2: As a former student and as supervisor I find that students that were involved with student organization leadership for organizations that are run primarily by the students are significantly more prepared for the workforce than those that were involved in university run programs.

---

Rec #3 – integrate student health services and counseling and psychological services into Texas A&M Health. I was a student at University of Iowa who also has a medical school. Their student health service was part of the hospital/medical organization and I felt this worked very well from my perspective as a student.

With the exception of the Money Education Center, the other units aligned with the Career Center in the proposed Student Affairs organizational chart serve small, specialized student populations. This would appear to give lower priority to career services than they were given under the previous organizational structure within the Provost's Office. The Career Center should play an integral part in the success of ALL students, helping them to acquire and articulate the value of experiences that sharpen their career path focus, build their confidence and equip them to pursue a satisfying career. The Career Center also plays an important role in maintaining and building recruiting relationships with employers and facilitating student connections with programs and employers through informational and recruiting events. The impact of the Career Center should be prioritized and connected to the academic interests of the University to maximize recruitment and retention at a time when the value of an expensive college degree is often questioned. The current centralized Career Center model with embedded college-specific liaisons is effective and should be fully

supported. College-specific liaisons are able to draw upon the extensive resources and shared knowledge within the Career Center while meeting the unique needs of the student population they serve.

As stated above, regarding the recommendation to move the Veterans Services Office to Student Affairs, as the wife of a combat veteran, it is my opinion that veterans bring to their educational career a wealth of experience and challenges that are not found within the regular student body. Combat veterans have seen death and destruction, and have caused death and destruction, that no other people group has experienced, except for international refugees, and those are elements carried into their careers as students. As such there is a need for greater specialization in engaging with these students for their success that is best served by leaving the Veterans Services Office under the Office of the Provost.

The report does not make it clear what would happen to the current organizations located in the MSC and their reorganization with other student organizations. Why would OPAS be moved out of the MSC programs office to the Office of the Vice President for Academic and Strategic Collaborations? This is a student organization.

I support and agree with the recommendations to centralize HR and finance responsibilities, but an intentional effort needs to be made to maintain the roles that serve as the nexus for accounting and HR to intersect, which is its own role in my opinion.

Moving SHS and CAPS to the College of Medicine seems like a good opportunity to make sure our students get the very best care.

Recommendation #1 Student Affairs P.41 Move the Memorial Student Center OPAS Program to the Office of the Vice President for Academic and Strategic Collaborations • OPAS Administrative Staff are closely tied to the MSC OPAS Student Committee and advise them. o This committee is not a recognized student organization (Like all MSC Student Committees) and serves as an extension of an administrative department under the structure of the MSC and its constitution. o OPAS being an administrative and student organization allows us to get student organization rates when using the Rudder Theatre Complex for performances. o The Student/Staff relationship in OPAS also carry to the OPAS Board of Directors and their standing committees. (This is a great learning experience for the students.) o The OPAS Student volunteers provide ushering and ticket taking and front of house services that would be very expensive if Rudder Theater Complex had to provide these services. o For nearly 50 year, the OPAS Student/Staff partnership has provided many students life-changing experiences and in return contribute to OPAS in many ways as former students. o If OPAS is separated from the student committee, it will need to be determined if an advisor to the committee remains in the MSC or if the committee becomes a student organization under the Office of the Vice President for Academic and Strategic Collaborations. • OPAS has many endowments, of which several are directed to the student experience on the committee. • MSC Box Office is closely tied to MSC OPAS and is currently supervised by the OPAS Executive Director • Both MSC OPAS and the MSC Box Office provide a revenue stream to the operating budget of the Memorial Student Center. Recommendation #1 Student Affairs P.41 University Art Galleries to Academic and Strategic Collaborations • The Runyon Endowment, which funds a portion of University Art Galleries is administered by the department of the Memorial Student Center. This relationship is governed by a trust in the Texas A& M Foundation. The Foundation owns the Runyon Art Collection. • MSC Visual Arts Committee (a Student Committee within the MSC Department) produces exhibitions in the Reynolds Gallery and the committee pays University Arts to run security because it is contiguous to the Forsyth Center Galleries. Recommendation #1 Student Affairs Reorganization High Impact Practices (HIPS) P.41 • Many of our organizations currently have High Impact Practices (HIPS) and we will need to develop a common definition so all at the university are on the same page when we define and assess them. Overall concerns and impact on the department of Memorial Student Center • Programs and facility operations of the MSC have been decentralized since the 1970's . The department of the Memorial Student Center produces campus-wide programs and UCEN is responsible for the facility management. The relationship between the two are very important. • Access to facilities and the Theater Complex is important to the department of the Memorial Student Center mission of producing campus-wide programs.

Finding #1 - I am okay with integrating the 5 offices mention and agree with most of the removal/moving of the offices suggested. However, I do not believe Student Health Services and counseling should be moved to TAMU Health, nor should student financial services be moved. Finding #2 - I enjoyed the independency of the student organizations. It allowed for the students to organize and focus together without feeling direct pressure from the university itself. The way this is suggested, this is way too much involvement. While a liaison should always be there and someone should be aware of the organizations and their practices, having any direct involvement would be off-putting and take away from the "student" part of student organization. Doing this will result in more off-campus organizations (Student Bonfire, for example. While they are great at self regulating and monitoring their organization, this is an excellent example of

students being involved outside of university sanction.) Finding #3 - My disagreement to this was addressed in the academic realignment section.

I was disheartened to read of the consultant's view of the Division of Student Affairs. Widely regarded across the nation as one of the best Student Affairs Divisions, it was certainly disappointing to read that the Division is considered unorganized, etc. Having worked in units across the campus, I feel that Student Affairs is probably the most organized that I have ever worked for at Texas A&M. I would like to also voice my concerns over moving the Veteran Service Office to Student Affairs. First, the two veteran offices (VSO and VRSC) have been working in tandem to support the veterans for over ten years now. They both provide outstanding services and there is no reason to combine them. Moving the VSO to Student Affairs will have a negative impact on the veterans they seek to serve. National best practices have shown that two separate veteran office (VSO-benefits and VRSC - comprehensive support) are much more successful. Finally, why fix what is not broken? The veteran support at Texas A&M is the best it has been in the school's history...why change it for the sake of change?

Personally, I get excited by the prospect of change and the opportunity to re-think what is being done and to consider what can be done differently. However, change also needs to make sense. Unfortunately, several aspects of the Student Affairs portion of the report fall short of truly explaining the "why" related to the profound recommended changes. I outline my concerns in themes below: (1) Removal of Music Activities – As the choral and instrumental ensembles housed in Music Activities are considered registered student organizations, it seems counterintuitive to the report's second recommendation relating to the alignment of student organization management resources to further complicate the student organization and leadership experience by having these student organizations housed within a different administrative structure. Further, the Music Activities Center is truly a student space and not a performance hall. After reading the goals of the new (and eclectic) Academic and Strategic Collaborations unit, it seems that the goal of providing a more robust community-engaged performing arts portfolio is better accomplished through efforts towards building a new performing arts center. I do see a strong connection of the Music Activities student organizations to that larger goal, but I question the strategy and practicality of pulling in student musical organizations into the administrative structure of a new division when the larger performing arts goals could be accomplished through strong partnerships between Student Affairs and the new Division of Academic and Strategic Collaborations. I would hope that the goals moving forward would be to establish and support more robust cross-divisional partnerships rather than further perpetuate siloed activities. (2) The removal of Becky Gates Children's Center - The team at Becky Gates is top-notch and they provide a childcare service to faculty/staff/students that is unrivaled within our community and, frankly, nationwide. I have concerns that their proposed placement in the Academic and Strategic Collaborations will further stress their limited resources and capacity unless it is provided adequate resources to grow and meet whatever expanded scope is being considered by upper administration. The current director, Erica Ritter, is someone who should be pulled into conversations about the future of the Becky Gates Children's Center as she is truly a scholar practitioner in the field of early childhood development and an invaluable asset to this campus community. (3) The centralization of IT, Marketing, HR, and Financial Services – While I can appreciate how centralization of certain functions can bring about greater efficiencies, I worry that Texas A&M is too large and complex for this magnitude of centralization. It appears that the consultants defaulted to centralization via organizational structure approach rather than exploring what efficiencies could be possible via collaboration and policy approach to efficiency. That being said, I do agree that certain aspects of these areas make sense to be centralized, but we stand to lose a great deal of efficiency and responsiveness by removing some of these services from the local level (i.e. helpdesk, IT software development, and marketing efforts). As someone who has worked over a decade in Student Affairs at multiple institutions – I am concerned about the impact on the student experience and student support due to the foreseeable red-tape and bureaucracy that these centralizations will create and ultimately slow down our responsiveness to student needs. (4) The removal of Counseling and Psychological Services from the Division of Student Affairs - Nationwide, divisions of Student Affairs tend to house CAPS due to the embedded outreach and educational components that makes mental health services successful on a college campus. As the report mentions in Finding # 1, the current pandemic has impacted the work of Student Affairs and one of the main impacts has been the need for the Division of Student Affairs to embrace the gray areas of student support and assistance. As a result, Student Assistance Services (within the Office of the Dean of Student Life) has become a first stop for faculty, staff, and students for resources. This centralized model of support is one that is growing rapidly across the country, and what makes this approach to student support effective is the ability for Student Affairs staff to quickly connect students with mental health professionals. The expediency of these connections is reliant on two main factors (1) formal and proximate staff connections and (2) the ability of mental health professionals to understand (and

appreciate) both the work and the philosophical approach to student support in the profession of Student Affairs. Both factors are best facilitated by being part of the same divisional staffing structure as this allows for accountability in communication and consistency in the quality of service. While it seems that it's a foregone conclusion that CAPS, along with Student Health Services, will move out to bolster the Texas A&M Health endeavor, I hope that strong consideration is given to the opportunity to develop a dotted-line accountability and communication connection between CAPS and Student Affairs. (5) Overall quality of the report – I feel it is worth sharing my concerns about the quality of this report and some of the broad assumptions it made about the Division of Student Affairs' work. Particularly, I was dismayed to read that the consultants viewed the Division's work as disorganized and ultimately a "threat to tradition." Contrarily, I believe that this division does a fantastic job at supporting student leaders in carrying out the many important traditions on campus. The internal survey to campus stakeholders (located in Appendix 1) also supports that the Division of Student Affairs is widely viewed as an effective division in its work. I am perplexed by the consultant's perception that student organizations are running amuck and there exists significant concern about the risk this poses to TAMU. As someone who moved half-way across the country to serve in the Division of Student Affairs, I can confidently say that TAMU Student Affairs is known as a national leader in student organization support and development – especially related to risk management. It was disappointing to see a consultant (who conducted only one interview within our division) come to such an inaccurate conclusion. Is there room for growth and improvement – of course there is. There's room for improvement with any organization. However, this report fell short in accurately and fairly depicting the great work being done by hundreds of dedicated professionals. Again, I feel that this inaccurate appraisal of the Division of Student Affairs was a result of subpar methods in data collection and usage of literature (many of it dating back over 10 years). I would have hoped for more given the sizeable fee the university paid to this consultant group. As I mentioned prior, I do appreciate change and "shaking things up" and there are some elements of the Division of Student Affairs' report that I appreciate – such as the inclusion of the Career Center. I also can appreciate the boldness of some of the new directions this report recommends. However, I feel that a deeper dive is necessary to fully understand what all these proposed changes ultimately mean for the student experience and our ability (as a division and as a university) to appropriately serve our students and meet their needs.

---

Recommendation 1, Reorganize Student Affairs. I agree with all elements of the recommendation except moving "music activities" to Academic and Strategic Collaborations to prioritize the relationship between Texas A&M and the State of Texas. What about music education and organization at Texas A&M is a state priority that would result in the state directing or deciding what music programs and performances are appropriate for students. The justification for the move in this section is even worse than the one under Academic and Strategic initiatives! Recommendations 2 and 3. I support, especially any opportunity to better support counseling and mental health services to our students.

---

The Public Policy Internship Program is an academic experience, not a student affairs experience. Moving it will create friction that will ultimately undermine the efficacy and value of this program. If the intent is to raise the profile of the Bush School, why not move PPIP there? Why not leave it in Academic Affairs under Undergraduate Studies?

---

MSC OPAS was recommended to move out of Student Affairs and into the Academic and Strategic Collaboration's area. Student Affairs supports OPAS well currently in regards to the student committee associated with OPAS. It would be of the highest importance to ensure the student committee component is protected and offered growth opportunities within the recommendation. From a facility stance, the student committee aspect provided 'student rates' when booking Rudder facilities. If that status was lost the cost of venue rental would cause severe budget strain. The student committee is also the day-of labor in terms of ticket scanning, ushers, greeters, etc. it would not be cost effective to hire out personnel to work our level of shows. MSC Box Office was not mentioned in the report but is an integral part of OPAS' success. The oversight of the box office allows seamless season purchasing, single show, etc purchasing options to our devoted patrons. It would be very difficult to work with an external box office to manage the rigor of ticketing and seating we curate to our donors and long standing patrons. Further clarification on the funding structure changes would be helpful. OPAS currently pays all their own bills (office supplies, copy machines, phone service, etc) and writes a check back to the MSC. Would the move alleviate some of those expenses as well as offer more financial support? Along those lines, where would accounting and contract support reside? The MSC offers exceptional accounting support to us.

---

Not enough insight to comment.

---

Centralized advising requires advisors to know a little about a lot of degree plans instead of know a lot about a few degree plans. Student who have centralized advising models find that they get a variety of answers with little to no consistency. It would be a mistake to take away specialized knowledge in advising and replace it with generalized

knowledge.

Generally agree. I would add that significant investments should be made in the Career Center, and the focus and effectiveness in this area should be a top priority. Having TAMU students struggling to achieve career goals after significant investments have been made in higher education should not be common practice.

This feedback pertains to the MGT Recommendation (pp. 43-44) to integrate and import the Veteran Services Office (VSO) to the Division of Student Affairs (DSA). In the rationale, the MGT Report referenced research suggesting improved efficiency and increased effectiveness to reorganize according to "shared purposes and service offerings." I respectfully ask our campus leaders NOT to implement this recommendation for the following reasons: - Based on my research on the 102 years of veteran support at TAMU and after nine years of leading/building the Veteran Resource & Support Center (VRSC), this recommendation, if adopted, will significantly reduce efficiency and effectiveness by misaligning critical functions. This recommendation has the potential to significantly degrade the substantial progress that TAMU has achieved over the past decade in support of those who have served! - Point #1 - Contrary to the 'intuitive myth,' the VSO (SFAID Office) and the VRSC (DSA Department) do not share the same mission or functions.

- o The VRSC is focused on holistic veteran support through extensive campus/community collaboration but also provides minimal services to military dependents.
- o The VSO is focused on educational benefit processing; the majority of their support is for dependents.
- o While there is some overlap, these offices perform vastly different functions and require very different skill sets and campus partners.
- o The following is from the Bush Institute Playbook for Campus Veteran Service Providers that will be published in the near future. It outlines the (often misunderstood) components of veteran services in higher education. Student Veteran Services - Understanding the Key Components: Effective student veteran support requires the dedication of resources for two distinct functions; certification of educational benefits and resource or support programming. The certification of GI Bill benefits (and in some locations, state educational benefits) is a complex process with dynamic regulations that often dominates the focus of campus veteran services to ensure financial aid compliance. Think of this component as the "science" of student veteran support. The resource and support programming area typically includes all other student veteran services except benefit certification. The Community College Research Center at Columbia University categorizes non-benefit support services into three areas; academic, nonacademic, and career. Think of the resource and support programming as the "art" of student veteran support. The ability to adequately resource and balance both the science and the art components is the hallmark of campuses with leading student veteran services and ultimately, higher student veteran success rates. - Point #2 -The educational benefit processing is naturally aligned with Financial Aid (not Division of Student Affairs) functions. Moving the VSO to student affairs will require benefit processors (who will be DSA Staff or supervised by the DSA) to constantly rely on Scholarships & Financial Aid (SFAID) for the following:
  - o Access to SFAID screens in COMPASS
  - o Cross-Training on Financial Aid Awarding and Adjustment Procedures
  - o Access to student transcripts, admissions files, SFAID and billing records
  - o Assistance for compliance audits- Point #3 - The VRSC support is naturally aligned with the Division of Student Affairs. The rapid growth and sustainment of services provided by the VRSC is best facilitated by close collaboration with numerous DSA departments. Over the past nine years, the VRSC has enhanced student support through extensive work with every DSA department. - Point #4 - What is this recommendation trying to achieve? The report identifies efficiency and effectiveness as the desired outcomes. I believe that this recommendation is about a decade overdue. The efficiency and effectiveness of TAMU military-affiliated student support has been significantly enhanced over the past nine years with the establishment of the VRSC and its collaborative network (to include the VSO).
  - o TAMU has supported these students since 1919. There is significant evidence that this support was critically deficient in at least four post-war eras (WWI, WWII, Vietnam, and early post-9/11) under a "single-function" or centralized model of support. This recommendation will actually (again) degrade both programming and benefit processing efficiency.- Point #5 - The current structure has created unparalleled success in the history of our campus. After the VRSC was established, the VSO's ability to focus solely on benefit processing has dramatically improved compliance/audit results (a nearly perfect record of zero findings in the past few years). The VRSC's ability to focus on holistic veteran support has produced a unique 'Application to Vocation' programming support model that produces new best practices for our TAMU System, state, and nation. Additionally, the VRSC's singular focus has enabled the staff to raise nearly \$20 million in support of our student veterans and their families. Efficiency and effectiveness are at an all-time high! - Point #6 - Adopting this recommendation at TAMU would contradict the prevailing veteran services organization/structure at the majority of the 20 peer institutions identified in the MGT Report. Of these 20 campuses, 13 have decentralized services (similar to TAMU) for their military-affiliated student

support functions. (NOTE – None of these MGT Report peer institutions are in Texas. Due to the added tasks and complexity of reporting (and compliance) for the Hazlewood benefit, Texas campuses have an even higher rate of decentralized services). - Point #7 - The MGT Report does not address the imminent changes that are already underway for veteran services at TAMU. o With the new Aggie One Stop office (full operational capability scheduled for January 2022), the VSO will make significant changes to increase efficiency and effectiveness for all students, to include military-affiliated students. o The VSO will no longer be a named entity within SFAID. ¶ The staff who process military benefits will remain part of SFAID, however, the forward facing assistance for any question related to military benefits will be handled through the Aggie One Stop. This will allow the benefit processors to more efficiently focus on processing instead of direct customer service. ¶ The elimination of the named “VSO” will also eliminate any remaining confusion about the services provided between the VSO and VRSC. Your support in this matter is critical to sustaining TAMU as the destination of choice for student veteran success. While we have had much success in the past nine years, we have too much left to do. Adding the VSO to the DSA/VRSC would take Aggieland back to a time when we were not a national leader in this critically important area. If you remained convinced that this recommendation should be implemented, I invite you to visit with the VRSC and the VSO leadership. I am confident that we can provide a unique insights that will change your opinion. We are collectively in agreement and extraordinarily passionate about NOT erasing the progress of the past decade. THANK YOU for your careful consideration about how we Serve Well Those Who Have Served!

As a member of DSA the recommendations appear to be quite sweeping. I acknowledge the benefits that can be gained with integrating CAPS and SHS-I believe this is a best practice and will serve students better than our current model. And if moving these functional units to TAMU Health will accelerate the growth that is desperately needed to serve the growing student population then it is absolutely the right thing to do. CAPS and SHS historically have been integral partners with other DSA departments, particularly in the areas of student conduct and behavior issues. These partnerships and collaborations should remain intact if at all possible to avoid silos that can increase the threat to campus safety (think Virginia Tech-Mr. Cho). Both CAPS and SHS serve on the campus-wide threat assessment & student behavior teams which should continue. It is interesting that the consultants note that in 90% of the institutions they used for comparison, SHS and CAPS were in student affairs. However, I do see many opportunities for staff growth with moving the organization under a College of Medicine and a significant opportunity to expand the educational opportunities for our professional students within the HSC. An important concept to understand is that SHS and CAPS are not just another clinical operation. The missions of the organizations are to support all students so they can be academically successful, not just those who have insurance or those who can pay for the care. Within the other recommendations made about DSA I know that some of those changes have been tried previously with limited or no success. Hearing from individuals who have been part of these previous endeavors will be important when crafting the course for the new alignment.

I don't have any feedback for this section other than to say the moves, generally, make sense to me.

As a 30 year employee of Student Affairs, I have experienced many changes and departmental evolutions. Some have provided enhancements, while others have negatively effected the operations and services of departments and the Division. Student Housing is a vital part of Student Affairs. A student's home provides the base of their life and their success. If that home is not in the best condition and doesn't provide the student safety and comfort, the student can not perform to the best of the their abilities. In order for Student Housing to be the best it can be, it needs all its resources and services under it's control. The Director needs to have their own facilities and Business services providing to the needs of the Department. While I understand the centralization of processes and their benefits, often the centralization of services does not provide the best outcomes. The Division of Student Affairs centralized IT services years ago. Student Housing had 6 IT professionals dedicated to our services prior to this centralization. The Department's services and operations suffered greatly. It became difficult to get computers serviced, functions accomplished and databases managed without our own IT. Positions will eventually have to be created to perform services lost by these areas, ending up costing the departments more. I firmly believe centralization will have a negative effect on the operations and services of the Division. I am unsure of the thought process behind Counseling moving to the Health Science Center. I feel they provide services related to Student Affairs. I am sure their staff receive continuing education from Health Professional. The Memorial Student Center seems to belong in the Student Affairs due to student groups it supports and the "other education" provided. As for Student Affairs Communications, I believe that to provide the best service, the Division needs a dedicated marketing group of it's own. People are invested and

dedicated to the individuals performing the evaluations and pay. I believe services will be lost. The Division needs their Accounting and Human Resource professionals. As experience in the IT Centralization for the Division, people performing those duties lose sight and become disconnected from the Departments. You can centralize processes without removing the supervision of the functions from the Department and achieve success.

Centralize Undergraduate Academic Advising This would not serve our students well. Although economic efficiency might be achieved, access for our students to advisors with more than a surface understanding of various disciplines is at risk. Provide more support to decentralized advising to better ensure our students know their options and are supported/accountable throughout their undergraduate careers. Create an Office focused on Improving Recruitment and Retention of Undergraduate Students Expand the Student Success Center support programing and offer the FYFX Hullabaloo U course as a year-long class.

More Diversity initiatives. More inclusion on campus. Make all people feel welcomed. Create a culture that is not only based on tradition but acceptance.

Consolidating academic advising would be a HUGE mistake!

No opinion.

No comment

From a risk management perspective, I support the recommendation to require more oversight and accountability to large, student-led organizations, events, and activities. However, it seems like over emphasis was placed on one student organization (Fish Camp) over other student organizations.

While it saddens me to see CAPS and SHS leave the Division of Student Affairs, I understand the reason behind it.

The revisions to Student Affairs will help strengthen and better focus its mission and impact. Those departments or units being removed are better suited elsewhere, including the department I work for.

I support the suggestions in this section.

I agree with the organization recommended.

Centralization of academic advisors is not a good idea. Centralization only works if it is staffed properly and the staffing increases as the work load increases. Centralization also leads to cuts because the function is a big target during lean times and historically the cuts will never be replaced. Students deserve the attention and direction good academic advisors can give them. Sure streamline the process for changing majors if that is problem, but don't take the focus off the student/advisor interaction.

None

Money Education from Scholarships & Financial Aid to Student Affairs. The MGT reports speaks to student debt in relation to the Money Education move to Student Affairs. Student debt and Money Education align in Scholarships & Financial Aid(SFA). Within SFA purview the coordinated efforts to address financial literacy topics such as budgeting, student loan repayment, and other important financial literacy topics that can be taken with a student for a lifetime. SFA was able to secure funding for the Money Education Office to support the THECB's 60 X 30 plan as we work to reduce debt, lower the loan default rate and ensure general financial literacy for college students. Having more instructors to teach the AG EC class which is the core curriculum course can certainly reach more students and have an impact. MEC reaches a large number of students now, and has connected with many student organizations, as well as Hullaboo U and first year experience classes. Perhaps a good discussion on where we want Money Ed to propel is the starting part, instead of an all out move from SFA. Again happy to discuss.

All good. Making best use of the resources of the Health Science Center's professional students to support student health services is both logical and an excellent learning opportunity for the professional student.

This realignment makes sense to me.

It is a great move to pull recruitment away from admissions and put into the new Academic and Strategic Collaborations office. Recruiting students to Texas A&M is part of a larger picture of A&M presence in the community and building lasting impact for that community. Centralizing Advising is not a good idea. There needs to be better communication among the upper administration and the colleges, but there are too many nuances for each college for centralization to

be effective. Advisors need to be specialized in their field.

---

These seem like good ideas. Should all of the Jordan Institute should stay in Student Affairs given the overlaps with Study Abroad and Financial Aid? Should the University Youth Programs office stay in Student Affairs? Seems like a good fit to move the Health Center and Psychological Counselling to the health focused component of campus.

---

No input to provide

---

Students may chafe under more oversight but may accept the challenges if new structuring is appropriately presented.

---

Student health and CAPS needs to be together, it can be hard for students to know who to contact or where to go if they need a particular service especially if they are going through a rough patch. This way it is easier for someone from the health office to direct them to CAPS it that is where they need to be. I know as a student they would tell us to fill out a questionnaire/survey after/before our appointment that would asses how we were doing mentally and if it was not good I wouldn't take the time to go find the CAPS office I would just not take action and go on with my daily life, I think if students have the resource in the same place they are more likely to go.

---

Student programming in the Memorial Student Center was created to meet education needs - to provide real world experience for students. To the degree there are serious failures, that reflects poor training or supervision of advisory staff. Address the staffing needs, rather than destroying the educational opportunities for students.

---

Centralizing IT, HR, Communications, Finance, etc. are terrible ideas. Nobody likes contacting a centralized office for those things and waiting for a response from someone across campus who doesn't know them, their department, or their specific needs. It makes for terrible customer service.

---

Student veterans would lose a tremendous advantage should the Veteran Services Office (VSO) move to the Division Student Affairs. The services that the VSO provides are heavily processing and compliance driven. The VSO's primary function is military education benefit processing and certification. As noted in the MGT Report, the primary focus of the Division of Student Affairs (DSA) is student development. It is correct that at present there is an office within the DSA that serves veterans- the Veteran Support & Resource Center (VRSC). However, the services of military benefit processing by the VSO go well beyond veterans alone. In fact, the student veteran population served by student affairs (the VRSC) is only a fraction of whom the VSO serves when you consider the additional 3000 dependents who are eligible for VA, Hazlewood, and the Texas Armed Services Scholarship Program (TASSP) funds. There is no duplication of effort nor responsibility, other than two offices presently having "veteran" in their name. The Student Affairs and VSO campus networks and dependencies are VERY different. The VSO (a part of Scholarships & Financial Aid) collaborates with EIS, Registrar, and Student Business Services on a daily basis to effectively and efficiently process military benefits. Thanks to the well-established collaboration of the aforementioned units, the student benefit request process is automated, and all documents are uploadable to the financial aid portal. Students (although welcome to) do not need to visit the VSO to receive military benefits/services/assistance. Benefits processing is an enrollment management initiative, not a student development initiative. Not only does veteran benefit processing fall under Scholarships & Financial Aid (SFA) in the present organizational structure, it also is a part of the Banner (Compass) Financial Aid module. All eligibility/processing/forms fall under the financial aid security structure in the System. And, because VSO is a part of SFA, the VSO is able to (1) facilitate/collaborate for professional judgment for cost of attendance increases, (2) provide assistance with federal, state, and institutional aid, and (3) identify additional eligibility opportunities (emergency aid, TEXAS Grant, etc.) to maximize college financing for students who also receive military education benefits. Because the VSO is a part of SFA, funds can be awarded to assist students with educational expenses- determining eligibility and solving problems on the spot. Further, the VSO has a heavy emphasis on reporting and compliance- from Veterans Affairs as well as the Texas Veterans Commission, and the Texas Higher Education Coordinating Board (THECB). Hazlewood utilization is monitored and reported several times a semester. The VSO manages this. The VA conducts compliance reviews (audits) almost annually with the four facilities we certify benefits for- GV, HSC, Law, and CS. The VSO manage this. And, the VSO facilitates the eligibility determination and processing of the Texas Armed Services Scholarship Program with THECB and HHLoans. Scholarships & Financial Aid has the knowledge and experience to support this. There have been minimal to no findings on any reviews in recent years. There is no similar infrastructure within student affairs to support this. Finally, the MGT report provided no reference to the Aggie One Stop which has launched and will open its doors January 2022. Not only will the Aggie One Stop provide access to services provided by Admissions, Registrar, Scholarships & Financial Aid, and Student Business Services, it also will provide military education benefits customer service. In moving the VSO service component to the Aggie One Stop, students receiving military

education benefits will have even more resources available- all in one place. As a result, the remainder of the processing staff will be able to devote more time to process improvement and efficiencies in an already very effective system. In fact, once military benefits customer service moves to the Aggie One Stop, there will no longer be a need for the VSO to be its own office/have a separate identity. It will simply be one of the teams within Scholarships & Financial Aid, whose specialty will be processing military education benefits. Although the benefits processing staff will still communicate with and provide assistance to students, it need not maintain the name Veteran Services Office. The VSO is truly a benefits processing unit with a robust and successful infrastructure. Benefits processing is a college financing opportunity, not a student development affair. It would be regrettable to dilute the true function and efficacy of either student veteran programming or benefits processing by pulling the VSO into a unit that serves a very different mission. I highly recommend keeping the Veteran Services Office (military benefits processing team) anchored with Scholarships & Financial Aid to preserve and facilitate program integrity and to continue to amplify student access to funding for education.

---

Student Affairs is an exercise in strange bed fellows. It does require realignment.

---

i do not have enough background to provide information.

---

Moving advising to a hub is terrible. This takes away the experience for our students working with advisors that are committed and have knowledge of programs. Moving this to a central hub will be like herding livestock.

---

I am appalled at the number of changes that were made as this "study" was being conducted. That demonstrates a staggering lack of rigor. It is the equivalent of counting the number of clowns coming out of the driver-side door of a car when they are circling behind you and re-entering on the passenger side. Again, I feel that the notion to treat the Aggie Band differently than the rest of the Music Activities is punitive. I would be curious to know if there was any consideration was given as to why the Student Housing facilities staff was intentionally kept separate. It is a safety precaution.

---

I was not aware of the AVP position. The proposed shifts make sense.

---

I am a staff member and supervisor that provides HR and Business Services to several departments within the Division of Student Affairs. HR and business services are more than processes that are handled in a centralized office. HR and business services are not two independent jobs, but are in fact, totally intertwined which is what provides the in depth service that is essential to success for our departments. To view these as separate jobs is missing a very important piece of the bigger picture of service. To streamline, especially in a university of this size, does not always result in more efficiencies, but in fact fails to provide an in depth understanding to make decisions regarding budgeting, HR, and forecasting to name a few. The need for in depth knowledge for guidance on spending, HR actions and their impact, is crucial for departments. Without this, the result is that departments are not able to focus on their expertise they were hired to do, but would spend time with duties and impact decision-making that is not their level of expertise. Only understanding one angle – business or HR - is not understanding the full picture of a department and how to best advise on actions. The uniqueness of each department/division requires business/HR people to be present in each area to provide that crossover knowledge specific to those needs and not reporting to a centralized area performing designated tasks or one area of focus. Another aspect not considered is the effect when you silo employees to become only knowledgeable in one area of duties (HR or Business). This does not allow for a well-rounded employee or a model that promotes growth to advance in one's career. It also does not allow an employee to have a full picture of departments or possess the knowledge of how one area affects the other. Staff are not task workers, but are in career paths and want growth opportunities. I, as many, have sought degrees in these areas and bring a level of expertise to HR and Business, making our division, and in turn the university, successful. As a supervisor, the separation of duties will result in retention and motivation issues as employees become stagnant and are not challenged. I urge you to look further than the surface on separation of duties, centralizing staff into HR or business, and the result of what inefficiencies this will cause. As a leading flagship institution, we should be setting the path, not following one.

---

As a Business Coordinator in the Office of the Vice President for Student Affairs, I have some concerns regarding the recommended changes to the university. While looking at the scope of work done by our office, we are more than individuals completing a single task at a time. We, as HR Liaisons and business services representatives, have spent years cultivating intentional relationships with our departments to become a resource they can trust and on which they rely. Due to these relationships, we thoroughly understand the specific organizational goals of each department. When assisting with processes, whether budgetary or human resource related, these departments trust that the betterment of

their work environment is our top priority. If business services and human resources are centralized as stated in this assessment report, building relationships with departments is no longer facilitated, and the services provided will not be as effective or valuable. When personal relationships are not formed and the organizations goals are not understood, how can an individual assist in any process, financial or personnel related, and be efficient or effective? Additionally, an overarching theory of organizational effectiveness is as follows: what works for one, will not work for all. With this in mind, comparing Texas A&M to other universities does not feel representative of our mission statement: “. . . Texas A&M University seeks to assume a place of preeminence among public universities while respecting its history and traditions.” In order to surpass like universities, why mirror their structures? After reading this report in its entirety, these recommendations do not align with the overall goals of Texas A&M University. Furthermore, it appears the recommendations made in this assessment in regards to business services within the Division of Student Affairs overlooked the importance and quality of service we provide. The complete effects of these changes were not considered, nor was anything assessed sub-surface.

---

 • The reorganization largely makes sense, with the exception of Marketing and Communications with is a whole mess.

---

I fully support the recommendation to expand the Money Education Center under Student Affairs. I have managed the Money Education Center for the past 5 years and although we have created one of the most effective and efficient financial education centers in the nation, we have always been significantly understaffed considering that our goal is to serve all 70,000 students. Money is the primary reason students come to college (the additional \$1 million dollars they will receive in lifetime earnings), and as the report states, it is also one of the top reasons that they withdraw. Withdrawal not only threatens students' lifetime earnings, but also Texas A&M's retention rate, graduation rate, and student loan default rate (non-completers represent a large percentage of our defaulters). Financial education is utterly critical to student and institutional outcomes. This is why our Center has developed programming, partnerships, and even a 3 credit hour course to strategically support both the masses as well as the students who are most at-risk of withdrawal. As a result of our efforts, our Center has been recognized by the Texas Higher Education Coordinating Board, the Department of Education, and the U.S. Treasury. Despite the success of our small team, it was decided within the last year that our Center and positions will be repurposed to serve the new Aggie One Stop which opens January 2022. Due to the staffing needs of the Aggie One Stop, our team is currently slated to be reduced and split up, and each of us as individual staff members will be required to spend a significant amount of our work hours focused on non-Money Education duties. The Money Education Center will also be moved off of main campus and out to the Aggie One Stop at the General Services Complex. As an optional student service, this off-campus location will make it much harder for us to engage with students. All of these changes will dramatically reduce how many students we are able to reach and how effectively we'll be able to educate the ones we do reach. This is heartbreaking since we have been told by thousands of students, Aggie parents, staff members, faculty members, and other University stakeholders how important our work is, and how grateful they are that we do it. Please approve this recommendation and give the Money Education Center the staffing, resources, and support it needs to give all of our students the financial education that they deserve.

---

Growth of the Money Education center is important as what they do can help a lot of students.

---

I'd like to reiterate a few points and add personal input. "A high internal staff turnover rate, a relatively small pool of qualified potential employees in Bryan/College Station, and the recent increase in remote job offerings nationally spurred by Covid-19 are also threats to retention." Add the fact that Austin, Dallas, & Houston are nearby and offer more opportunities for diversity, adequate compensation and promotions, and Texas A&M will continue to lose qualified talent (e.g. faculty, staff) to those more progressive areas that can meet their needs and support their interests better. I also believe the high turnover directly impacts the university's reactive response to crises and an "ever-changing landscape" when really a university this size should be fostering a proactive perspective for creating processes, developing initiatives and programs for a diverse student population, retaining high-quality talent, etc. Another factor that impacts the university's ability to recruit/retain talent is an overwhelming preference for and weight placed on having a graduate-level degree for most entry level positions where the salary range consistently trails behind the national average and isn't often readjusted for cost of living. I think not offering degrees to staff contributes to the inability to retain good staff. It sends the message that higher level degrees are important for advancement here, but we won't fully support your efforts to climb the ladder. I do know that A&M has increased the amount of aid provided to employees seeking a degree and offers educational release time to allow staff to attend classes. I think it's a step in the right direction, though, departments seem to interpret the educational release policy differently which means it's not

being applied consistently. Sometimes that inconsistency even occurs within a department.

---

Recommendation #2: Align student organization management practices to ensure transparency and accountability - wow - this sounds like we want student activities to be staff-led rather than faculty led, which is extremely counter to the Aggie experience. Recommendation #3: Integrate Student Health Services and Counseling and Psychological Services into Texas A&M Health is rather complex in that discipline-specific experience would be readily available, the focus of wholistic student health cannot be accomplished without the direct line to the Division of Student Affairs. SHS and CAPS are not just services - personnel in these areas draw close to student affairs scholar-practioners across the division to identify trends and assist students accordingly. A move of these units out of the division may result in student experiences become transactional rather than developmental which would result in a loss of the wholistic student health approach.

---

The restructuring of Student Affairs makes logical sense. Student organizations need more transparency and accountability. Integrating SHS and CAPS into TAMUHealth makes sense.

---

Student Affairs has been an outstanding partner for decades with other academic and staff departments. Dependencies on Student Affairs run throughout the university. Reorganization should be done very carefully because unintended consequences are likely to be significant. Finding #2 is contrary to legal advice with respect to student's rights to assemble/associate and self-determine their agenda. Too much university guidance will result in push back from students and may produce results that are at odds with this report's stated rationales. The greatest challenge that SA had was the individual hired to lead that organization. The President accepted his resignation and he is no longer the problem. Hire an experienced Student Affairs professional to lead the organization...do not promote a commandant to the permanent position. The experiences and skill sets of the military do not translate well. Student organization/student activities staff challenges are primarily challenges of staffing and resources. 1000 student organizations cannot be effectively managed with existing staffing numbers.

---

I have no opinion on these changes. They make sense to me, but I do not feel strongly one way or the other.

---

No comment on student affairs, however, I believe that the students should have proper representation, proper services provided to them, and should be protected in a responsible way. They are adults and should not be coddled but should be helped when needed. I also think that all students should have to take a traffic safety course because they walk out into the crosswalks or ride their bikes, scooters, skateboard or whatever like they don't have to follow traffic safety laws. I am afraid that one of them will get killed or seriously injured one day.

---

I found every recommendation to make perfect sense and agree.

---

1. I do not agree with the move of the Veterans Service Office (VSO) into Student Affairs. In my experience, the VSO manages Hazelwood benefits, Veterans Affairs benefits, and the Texas Armed Services Scholarship Program. These items fall more clearly under Scholarships & Financial Aid, where the VSO currently resides. 2. The Money Education Center is planned to move to the General Services Complex (GSC) which is at Wellborn Rd and F&B Rd. This is a completely inconvenient location for students to get assistance, as they must drive or take the bus. This inconvenience will be a severe limitation to the impact that the Center can have on students. 3. Fish Camp originally taught Aggie Traditions and Aggie Core Values. Recently, I have heard stories of LGBTQ+ indoctrination and promotion, which is unacceptable. Respect for diversity is one thing, but promoting the agenda of one group over others is inappropriate and unprofessional. I would not send my child to Fish Camp in its current form.

---

n/c

---

Making some of these changes will make it more efficient for Student Affairs, and allow it to re-focus it's mission. However, many of these components are tightly integrated and contribute greatly to the success of student affairs. I would once again, recommend caution on implementing many of these recommendations.

---

-

---

I completely agree with the reorganization of student affairs. Would the Office for Student Success also be housed in student affairs?

---

I agree. many redundant services across campus. Why does the School of Public Health have its own Assistant Dean of Student Services? Not necessary.

(it's holistic, not wholistic I believe)

With the exception of the Money Education Center, the other units aligned with the Career Center in the proposed Student Affairs organizational chart serve small, specialized student populations. This would appear to give lower priority to career services than they were given under the previous organizational structure within the Provost's Office. The Career Center should play an integral part in the success of ALL students, helping them to acquire and articulate the value of experiences that sharpen their career path focus, build their confidence and equip them to pursue a satisfying career. The Career Center also plays an important role in maintaining and building recruiting relationships and facilitating student connections with programs and employers through informational and recruiting events. The impact of the Career Center should be prioritized to maximize recruitment and retention at a time when the value of an expensive college degree is often questioned. The current centralized Career Center model with embedded college-specific liaisons is effective and should be fully supported. College-specific liaisons are able to draw upon the extensive resources and shared knowledge within the Career Center while meeting the unique needs of the student population they serve.

I fully support all of the recommendations provided by MGT as it relates to Student Affairs. I do not work in that arena but the recommended solutions appear to address the reported findings.

No Comment.

I feel that any area that works with students, and their affairs, should fall under Student Affairs. The upkeep and maintenance of their on-campus housing relates to their comfort which can affect their physical and mental health - all these should fall under Student Affairs.

I am not in a position to provide good insight into these changes.

I only receive emails and have not had any interaction with this office.

Where will Counseling and Psychology Services and Student Health Services fit in Texas A&M Health? As separate stand-alone Departments, or would they be placed under a current College or School? Once again, the report is vague.

Consolidation of Student Affairs will hopefully provide for an easy transition of students from TAMU programs to HSC programs. I feel that Student Affairs will be better able to serve student needs with an enhanced ability to collaborate across the entire organization to develop best practices to enable success.

this is desperately needed

N/A

I agree that there needs to be more coordinated oversight of student organizations.

No comments.

The proposed moves to DSA - Career Services, Public Policy Internship Program, Money Education Center, Aggie Honor System Office, Veterans Services Office - will greatly help students and a big plus.

The recommendations for student affairs seem to be in line to help the students.

I worked for the Vice President of Student Affairs for 6 years as an IT Manager for 5 of the Departments within SA. IT Staff at that time started a grass roots intuitive in 2000 to implement an IT consolidation plan, moving all IT Depts. into one Active Directory Forest with many underlying Departmental Organizational Units. It was not a welcomed plan. However, with my inside knowledge of the operation there is obsoletely no reason why this would not work.

3. I appreciate the recommendation to incorporate student health services with TAMU Health with a focus on holistic health. Greater emphasis and ease of access for mental health services is crucial for student support.

no opionion

No comment.

- Strategically adding new units to the Division of Student Affairs makes sense - the focus of Student Affairs should be on programming that enhances and supports student learning, development, advising, and leadership - Integrating Career Services, Internship Programs, Money Education, Aggie Honor, and Veterans Services aligns well - The linkage of moving

University Art Galleries and the Children's Center to Academic and Strategic Collaborations isn't apparent - this looks better aligned with Student Affairs - I have been through several IT consolidations in my 25 years in the military and recognize the value of consolidating IT services. There are several functions that can more easily be consolidated without significant detriment or loss of value to the Division of Student Affairs while other functions could set student programming back several years. More detailed comments under Information Technology - It is important to note that Residence Life provides a significant amount of programming that is very closely integrated into student housing - living and learning is very closely integrated with today's generation - this should have a further detailed analysis before decisions are made in this area. - Why not consolidate Student Life Studies into the Office of Institutional Effectiveness and Evaluation? I believe these are very similar functions and efficiencies can be gained - TAMU has a much larger presence of Student Organizations than most universities. Comments in the report on "establishing student organizations as semi-professional entities" is correctly stated. The technology and staff support provided to these organizations is very complex and should be taken into consideration when considering IT consolidation - Moving Student Health and Counseling Services to TAMU Health makes perfect sense and will yield efficiencies for the university and increase continuity of care to TAMU students.

No comment.

I love the focus on student success and retention. Student orientation information should be presented by the appropriate units, not by student leaders within the orientation. Much is lost in translation using the latter. Holistic health services are a great idea. Helping students be aware of services offered is essential.

In looking at the recommendations of what Student Affairs should be, especially in the Strength/Weakness analysis, the removal of Music Activities is precisely the wrong move. Providing student leadership development under the very hands on supervision and guidance of the professional staff is exactly what the bands, orchestras, and choirs of Music Activities do. Moving Music Activities from Student Affairs would be removing the department which provides what the report indicates Student Affairs should be doing perhaps the best of anything in Student Affairs. I can't help believing that the recommendation was made without an understanding of what Music Activities at Texas A&M actually is.

Makes sense, although I am unsure why the Corps isn't absorbed into the org chart and is left as a subset.

Missing from this is how we can keep Aggie graduates in the community. Often graduates will move away for jobs. How can we help keep them here long term and help the university.

N/A

With integrating CAPS and SHS with TAMU Health Science Center, my hope is that it would not mean a physical move to Riverside Parkway. Being back on main campus in the SSB has helped increase accessibility to counseling services for students. I fear that moving 5 miles away would have a negative impact on students ability to access CAPS.

I strongly urge the University to do anything possible to improve access to mental health resources for students, especially affordable counseling. It can make a huge difference in a student's experience and success at Texas A&M to have that kind of support during what can be a very challenging part of life.

I support the opportunity for Counseling service and Student health to move under TAMU health. This will provide greater collaboration and access to needed mental health resources that TAMU Health can provide. I look forward to seeing these changes on campus and the benefits that it will bring to the student body.

Not enough knowledge of this area to provide meaningful feedback.

I am a strong advocate for the Money Education Center to be moved under Student Affairs. It is currently under the new Aggie One Stop at the GSC building. The ME center's outreach and impact on the university community will be severely limited for the next two years.

At a minimum, maintain dotted-line relationships for accountability for Marketing/Communication, Facilities, and Information Technology. Preferably, these units should be kept in-house to maintain flexibility to respond to unique needs of the Division.

I agree with a support the recommendation made by MGT. DEI is of critical importance for campus and should be seriously considered and pursued.

N/A

I agree with the findings in this section.

## Student Affairs - Student

Please provide your comments related to Student Affairs:

In regards to Recommendation #2, Align student organization management practices to ensure transparency and accountability: I am 1000000% in strong opposition to this recommendation. Student organizations are in and of themselves the most strong and prominent TRADITION on this campus. By enforcing administrative oversight, we stifle creativity, freedom, and leadership development/growth of all of our students. This recommendation should NOT be taken, and students will be vocally opposed to it if it is.

N/A

DISCONTENT with Recommendation #3: CAPS and Student Health Services should not be merged. While providing holistic health is important, sometimes a cold is just a cold, and results in a student only needing physical help. Plus, by combining the two, there will be less emphasis on CAPS which provides counseling services for mental health, which is EXTREMELY important for student success and health. This merge would NOT prioritize student mental health, which is crucial to student success and the ability to flourish.

a. Removing Communications, Finances, and HR from within student affairs to a centralized department poses a risk of losing the focus on what is best for the students in favor of other interests b. The report does not describe student organizations and their benefits to students and the community in a way that gives confidence that they understand student perspective. While leadership development and accountability are benefits of student involvement, they come from the students taking initiative to bring positive experiences to their members and audiences. They are designed to provide these opportunities already, organically, with students leading one another in the way that has made student organizations at A&M a tradition. Students as well as audiences benefit from the students' right to lead these organizations in ways that satisfy the needs of their audiences from their perspective. Additionally, there are more values that are essential to being a good, contributing member of society than just the core values of the university, and our 11,000 student organizations should have the opportunity to continue to explore those. c. Additional institutional oversight over student organizations has the extreme potential to stifle the power of students to design and produce programming most relevant and impactful to themselves as well as the community at large while providing the opportunities to learn and determine what is most beneficial to society through that freedom. Oversight of student organizations also threatens the federal rights of assembly and speech in the event where student organizations promote ideas that aren't in direct alignment with the university. The content of programming should remain in the hands of the students.

Don't combine liberal arts and sciences.

As far as Recommendation 3 is concerned, way way way more funding needs to go to CAPS in order to make that work. CAPS is already overwhelmed in the Fall 2021 semester, and students I know who have gone to CAPS for help had not gotten the help they needed, and they said their experiences there were not good. In order to adequately help students, they need really good funding at CAPS. Ending a short-term approach with CAPS is a good idea, as many students going to CAPS will need long-term help for issues like anxiety or depression. Those issues don't go away after a few sessions. I also think that graduate students should be paid equally, regardless of program. Instead, each college pays their graduate students differently, and there's a wide disparity across the campus. Graduate students aren't even dealt with in these recommendations, but that is something that needs to be said here.

The findings of unclear communication was unfounded, there is plenty of excellent communication. Centralizing will only result in more confusing messages as they will be coming from one sole source instead of different ones.

I do not like it and do not think it will be efficient effective or necessary

Stay out of Fish Camp. The more that the university gets involved with fish camp, the less fun it becomes. Y'all are trying to take over one of the most pure and joyous traditions and organizations that A&M has to offer. Fish Camp is an organization that "cool" people go to and genuinely get people excited to come to our university, to which most of the time they aren't. Most incoming students come in with burdens and worries about college and Fish Camp alleviates those worries. The University is slowly changing Fish Camp into an NSC. Think about it, you unknowingly made a freshman orientation, what most people would dread to go to, a ton of fun. All because you stayed out of it. I just strongly recommend leaving alone one of the few good things that's you haven't already put your hands on.

---

Texas A&M is unique in the ways it produces leaders. In student organizations, we have the autonomy and freedom to make mistakes, which provides invaluable lessons for life. Every student organization on campus has an advisor to guide us, but not do the work for us. This system allows us to grow our confidence and learn tangible skills that we can and will use after graduation. Putting an advisor in charge of organizations will prevent students from learning these lessons. Once again, the excellence of our student body will be called into question if we are not given the chance to make mistakes and fix them. Hand holding does not make the university better, it only makes our graduates weaker.

---

All good plans, well thought out and needed for the improvement of Student Affairs.

---

The Corps should have the same oversight as before because we are a self run organization that has its own system of discipline. This allows for us to regulate our own members and keep vetting the leadership as moral leaders with good judgement

---

I think that we spend a lot of money focused on services that only benefit an extremely small portion of the TAMU student body. While it's important to make sure these students have support they need, there are much bigger issues that effect huge portions of the student body that are not being addressed. Tortilla making and sex talks in the pride center should not be a focus on our resources when students cannot connect to wifi all through September or miss class because of long lunch lines.

---

None, agree with the MTG Report.

---

While I value the process of soliciting and receiving outside constructive feedback, omitting graduate student voices in the body of knowledge MGT amassed to make their recommendations is a glaring omission. As significant contributors among the student body, we deserve adequate representation. I speak as an English PhD. student. In the humanities, GATS function more as junior faculty than the lab assistants found in the STEM fields. We control large portions of our course content and implementation. As a result, we influence several critical metrics important to the university's mission. For example, all our department's graduate students will teach ENG 104 and ENG 210, directly reaching the university's largest population of first-generation students. We do so earning a low pay scale that directly inhibits recruiting the best graduate students available, hampering the inclusive excellence that could further diversify our departments. I will keep my comments to these brief concerns, but I would have welcomed the opportunity to speak further on how we as humanities GAT's contribute to the university's success in these key roles. Therefore, I have issue not with the findings of MGT, but in how they were solicited. Our English department is flourishing by all metrics and inhabits a unique realm that requires careful thought before merging into a college of Arts and Sciences. If that is ultimately what happens, I will embrace it, but I urge for more input from those whose voices were overlooked because we contribute too. Findings may have been different had we been consulted.

---

Student organizations should be managed by students. Too much oversight by the university will result in student orgs "going unofficial" to dodge the restrictions, which hurts the university overall.

---

There already exists sufficient regulation of student activities. Student organizations must manage all their finances with the University run Student Organization Finance Center, and the Department of Student Activities already requires training for officers and advisors. These measures, along with the presence of faculty advisors, provides accountability for student organizations without becoming overbearing and overly bureaucratic. The additional measures proposed to regulate student organization will break this balance between student leadership and university management where the University will become an overbearing force in the operation of these student organizations. While "establishing student organizations as semi-professional entities with structured guidelines and expectations" certainly is beneficial to students, it is not be necessary for all organizations. While all organizations are expected to provide to an inclusive environment and uphold the University's core values, they cannot all be expected to exist a "semi-professional entities." Some organizations exist as simply a collection of students wanting to share similar interests in a casual setting. The existence of pre-professional organizations such as the TAMU American Chemical Society Student Affiliate Chapter

provides students the opportunity to grow their professional skills. However, expecting all organizations to abide by such standards will result in suffocating University oversight that may discourage organizations from forming.

Don't take fish camp and make it faculty run. Don't take student orgs and try to organize them for us. They should have some oversight but complete management and stringent rules will not lead to any growth in these student organizations to pursue new and innovative ways to make a difference on campus.

None

In regards to Rec #2, student organizations should have the ability to determine their own mission statements and goals, and would not benefit from increased oversight. As young adults, students should be able to learn from mistakes and leadership growth through autonomous organizations. Students are the primary source of knowledge of building the society of tomorrow, and are the best resources for tapping into what should be prioritized on campus. I fully support building cultural centers for students.

I agree that student organizations could use more training provided by the university, however, student organizations are diverse and vary in levels of professionalism for a reason. Students choose to be involved in various different organizations for multiple reasons; social, service, professional development or networking, etc. Having a strict model to which student organizations are held would strip away the opportunity for certain types of groups to achieve their desired purpose. In addition, it would deter students from learning. Organizations exist to prepare and develop us in some way, shape, or form for the real world. Regulating them further and containing them to a strict box would hurt more than it would help.

No clear solutions to the the issues involving the recruitment and retention of Black students.

The fact that there was little explanation as to what Recommendation #2 actually would look like in practice is concerning to me. I don't think the University should micromanage student organizations, or make them sign off on everything that they do. That would not only create a lot of work for the University, but also take away much of the sense of ownership from the students who are involved in these organizations. If the University wants to find out what different organizations are all about and what they're doing, they should interact with those organizations and talk to people who were in them in the past to get a better sense of what the true mission and goal is. Micromanaging would likely cause a great deal of uproar among both students and alumni.

Fish Camp has to be student run to maintain its nature. The organization, being one of, if not the most, recognizable organizations on campus the director staff, chairs, and counselors are all held to the highest standard that represents all of the Universities Core Values. Part of what makes Fish Camp so special is the connections made, both between consolders and with freshmen, changing the current structure would undoubtedly have unintended consequences. Fish Camp certainly has areas to improve, but removing the student lead aspect of it would ultimately water down everyones experience. Students know how to best run Fish Camp as it has been that way for many years now and there is no reason to change that.

The idea of one centralized "TAMU Health" conglomerate that takes a more holistic approach to health would benefit certainly make it easier for students to get the help they need in one location. That SCS (or CAPS) has always been in a separate location I think adds to the stigma/inconvenience of utilizing those services.

The whole point of fish camp is to learn from students at A&M. I believe that allowing adults to run this organization will take all that is special out of this organization. Hearing from current students is very helpful to freshmen students. It provides better connections to tamu. Fish Camp provides so many opportunities for the older classmen at A&M and by handing this organization over to staff it will take away multiple key opportunities for A&M students. We are preparing for the real world and what better way to do it then giving us the opportunity to take something into our own hands. I am not saying that staff has to be completely out of the frame but more regulations would be better than taking this organization away from students as a whole.

Do not manage student orgs.

What exactly are "High Impact Practice" services? Is that like how Mays guarantees you an internship? Recommendation 2 is kind of a bummer :( Changing the philosophy deprives us of our final years of being young adults and not young professionals. Have official student organizations for both schools of thought.

There is mention of increasing faculty oversight in student organizations like Fish Camp. This organization has been extremely successful in creating high retention rates for students that attend. This is certainly attributable to the fact

that it has been student-led for many years and these very students understand what the incoming class needs. Faculty oversight may be necessary in some regards, but every year the university encroaches more and more on how much student leaders actually get to impact the organization. Increased university control inevitably removes many of the traditions that the Fish cherish so deeply, and discourages student leaders from wanting to be involved at all. As a counselor of 2 years and a former co-chair, the consensus among student leaders is that every year fish camp gets less fun and impactful for both counselors and freshmen because of increased control by faculty and less autonomy for student leaders.

Please don't do the plan. It's not a good plan. We don't like the plan.

I strongly agree with the assessment and especially agree there should be a push for more inclusion amongst faculty and students. Specifically, the statistical data for the College of Engineering is very telling with minority groups being underrepresented across the board.

Treat your graduate students like actual employees. In the hard sciences, we are for all intents and purposes entry level employees. We spend our time receiving direct training relating to our research, performing said research, and taking up teaching responsibilities as needed. Even if said training takes the form of standard university classes, it is no excuse to treat us more like students than workers. Furthermore, since our responsibilities are so fragmented, its very common for people to be overloaded due to these responsibilities having crunch at the same time. The solution to this isn't therapy, its making sure it doesn't happen. No amount of counseling will make an 60 hour work week healthy, especially with how little it pays. Most of my peers would probably be fine with how much we make if we were at least treated better.

While centralizing advising would be good to do this by combining people who know nothing of the majors and students they will be inheriting is a poor choice. It is my belief that the university is jumping too fast into the water and could end up sinking the departments involved.

i like the idea of having centralized management for student orgs, but as a suggestion rather than a hard a fast list of rules. students should still have FUN!

Good.

Do NOT combine College of Geosciences, College of Liberal Arts, and College of Science. Makes no sense. Keep Liberal Arts separate, they don't even take science classes so should in no way be included in a College of Science.

Student Affairs are the one's who hold kangaroo court called Honor Council right? They need help. An entire report could be written on how the department of Student Affairs has failed the students of Texas A&M. I would recommend ignoring whatever was in the report and doing a separate report on that.

Good

The University should have less of a role in controlling student orgs in programs they can or cannot do.

Seems good, as a student I'm satisfied so all is well

Reorganizing the office of student affairs will require excessive costs to simply change reporting structure, yielding no benefits to students. A focus on unification and centralization will limit the development and education of students, without fail. For meaningful development to made in the creativity and leadership of students, they must be given the opportunity to try new things, fail, and learn. The new "high standard" that student organizations will be held to will prevent formal student organizations from growing and developing, forcing the creation of unofficial student organizations. A unified front for student health would be beneficial to students, if an emphasis on quality of service, as opposed to quantity of students serviced, was made.

Consolidated academic advising would be an immense detriment to students, since advising would be reduced to the function of a "call center." Information about courses and departments and degrees would be impersonal and shallow, since advisors would not personally know the faculty, courses, or requirements, as the advising staff currently does. However, having an office devoted to the recruitment of undergraduate students would strengthen the student body and be beneficial to the university.

Please don't change anything.

I support the new additions of the Veterans Resource Center, the Career Center, and the Aggie Honor System Office to Student Affairs as these are student services. The facilities operation of the MSC should stay in Student Affairs to

maintain the ability of students to effectively utilize facilities for programming. Again, I firmly oppose the removal of OPAS from the MSC. I support the move of CAPS and SHS to the school of public health, but I worry they may not have the administrative experience to properly run such large scale programs. It would be an immense burden. I support the idea of having a bigger focus on research and science based initiatives that moving it to the school of public health would bring, but perhaps it would be better for the Public Health administration to be involved in decision making and advising without running the daily operations. I am completely and unequivocally opposed to more administrative oversight of Student Affairs programs. Our emphasis on student led programming is a defining feature and unique part of the Texas A&M experience. Employers recognize the unique type of leadership found through student organizations that no other university in the world has. The "lack of accountability" mentioned is nonexistent, students are even more prepared for the real world by learning independence and being accountable to those they ultimately should be - other students and the future of the organization. Having the freedom to make mistakes is a unique part of the college experience. The openness in development of these programs creates opportunities for so much student ownership and growth - we create our own policies, passbacks, and learn how to create organizations that last. These skills are incredibly versatile and valuable. Suggesting administration handhold us while we put on conferences and events we have run for decades is an insult to the student intelligence, competence, and tramples on the long and vibrant history of student governance at this school. When talking about their time in this school, alumni always highlight their roles in leadership organizations and the incredible experiences they gain. The Texas A&M student leadership experience is one of the most treasured traditions, one that brings international recognition and career success to its students. Watering down these programs is cowardly and weak from administration and silences the student voice. I do not trust them to dictate what I can and cannot teach in my conferences; that is between me and my advisor as long as it is not illegal. I cannot speak to the specifics of Fish Camp as I am not involved with them, but the vast majority of student organizations are effective, efficient, and provide experiences to students that are often more valuable than the degree itself. Participating in these programs has helped my personal development immensely, largely because I have the freedom to innovate, explore, and create rather than follow a task list set by administration.

---

There needs to be a built center for Latino students on campus and black students on campus. A department needs to be built for undocumented students. Other universities have this and it is sad that we do not.

---

Advising for BIMS desperately needs to be re-organized. My freshmen year, one advisor told me it was not allowed to take 2 sciences and a math. Another advisor correctly told me that it can be done but it is sometimes not recommended. In addition, advising has been drop-in only. Students have classes and work and do not have 5 hours to spare to be on constant stand-by for 15 minutes of rushed advising. Appointments are effective and I support the combination of all departmental advisors. Perhaps the other biology or chemistry advisors will be of more help to me.

---

As a third year student at the Galveston campus, each year it feels that my campus becomes more closed off to the administration of Texas A&M not by the fault of TAMUG administration, but College Station. Texas A&M Galveston is continuously looked down upon by both College Station administration, and students despite having faculty that are experts that contribute greatly to the university and their field, and students that are more proud to be an Aggie than many College Station students. It is clear to every student in Galveston that we are not a priority to College Station administration. College Station is constantly receiving new facilities and improvements, while the Galveston campus has to fight for any minor improvement to our campus. Every effort exerted by College Station administration to "unify" the Galveston and College Station campuses only isolates our campus more. Our yell leaders are barely recognized by College Station, despite holding the same significance, and importance to us, if not more. The Galveston yell leaders represent our campus with the same honor, integrity, and Aggie Spirit at the College Station yell leaders and their presence should be as recognized and known as the College Station yell leaders are. Overall, I feel as though College Station administration and students do not recognize Galveston students as true Aggies despite "Aggies by the sea" being the primary marketing strategy to attract many students to our campus. I am proud to attend Texas A&M Galveston and a proud Aggie, but it hurts to see my campus be treated as second best especially when our students and administration constantly advocate and fight for our campus with little success or cooperation from College Station administration. I hope that one day our campuses can truly be united, and that our campus and students can be recognized as the Aggies we are.

---

As a student in the Galveston campus it has become more and more apparent how differently we are treated in comparison to College Station. I feel as though our presence is only a source of profit. There is barely any effort in building and improving our campus, and if there are ideas of improvement the process takes exponentially longer. Even though we are the same exact school, our inability to use our meal swipes/dining dollars in College Station make no

sense at all. Our yell leaders are barely recognized, yet they are just as meaningful and significant to us as the ones in College Station, if not more. They provide the same symbol of honor and integrity of Texas A&M University and yet they are treated terribly. I don't feel as included when I visit College Station. I feel as though my presence in Galveston is not as meaningful and is continually looked down upon. I am a proud aggie, but I hate to feel shame for a campus that is so near and dear to my heart. I hope we can become more unified with our brothers and sisters in College Station. I hope we can be provided with the opportunities and resources like students on main campus.

Why remove so many units from student affairs?

A Latinx Cultural Center should be built on campus - or designated. This would spin off from the MSC and allow a physical location for your coming recommendations - especially related to recruitment and retention for the hispanic/latinx community.

There needs to be more student resources available and clubs pushed for the higher education center at mcallen.

I do want A&M to reorganize to expand HIP services

From my understanding, Texas A&M Health Science Center is first and foremost a research and educational institution. Therefore, I do not believe it is right to move Student Health SERVICES and Counseling and Psychological SERVICES over to them. I believe there can be some sort of partnership, but I don't think the Health Science Center should fully oversee the operations of these two SERVICES for STUDENTS (aka Student Affairs). As long as the current needs of the orgs involved are heard and considered, I am fine with the other proposed changes.

Always take into consideration the way the students feel about a situation. We are the ones that choose to come and pay into this university, once you stop listening to us then be prepared for less attendance.

I believe that PPIP should not be moved in to student affairs.

Can we please have another chance at the class of '24 photo. You know it looks awful.

It would be an incredible disservice to the mission and legacy of President George H.W. Bush to merge the Bush School with political science. The Bush School is made of students who have self-selected to join a distinguished alumni population who are dedicated to an elevated, serious life in public service. Two of my favorite things about the Bush School is the small size of the student body and the small, but impactful and important group of former students. Another important point of my selecting the bush school was how prestigious and separate it felt from the main campus. The relationship between the Bush School and the main campus is just as it should be. Similar to Mays. Separate, but together. It adds a level of prestige. If you want to combine Bush with public science, then combine Mays with business administration.

None

I agree that the units should be removed from Student Affairs. The units that should be added truly serve the students at a more foundational level.

The student orgs do not need more strict regulations. As a student in several orgs, dealing with SOFC is one of the most painful experiences I've had. At the most, a better way to vet and approve fraternities could help with the issues we have.

I highly agree with recommendation #1 in integrating the Money Education Center with Student Affairs. Learning how to manage your personal finances is essential to reach financial security and the Money Education Center is a great resource to educate students about their finances.

MSC Opas should remain its own unit as it is now. No reason to move it.

Fish camp's values should not be combined with TAMU's values as it helps prepare the students to not only become Aggies but also prepare them for the sociopolitical and financial aspect of being a college student. It should be noted that diversity plays a significant role in Fish Camp and helps the students prepare emotionally and social for college whereas that is not a value at Texas A&M. There should be a combination fo A&M's values and Fish Camp's current values for Fish Camp.

Providing tailored advising for pre-professional students requires extensive experience so that the students can complete their required coursework in a timely manner. I'm concerned that a centralized advising process may be

significantly less effective for this my program of BIMS.

---

student leadership is important! if we don't allow student leaders to try & fail, then try again & succeed, what are they actually learning? i've had the opportunity to gain a ton of experience from student leadership positions, because i was expected to figure things out on my own. constant university oversight feels like a baby monitor.

---

I have concerns about the removal of the College of Architecture at Texas A&M University. I am a USAR major that one day hopes to enter the construction industry as a project manager. My main focus for the curriculum is the Construction Science aspect of my major, as this is what I hope to make my career. I know that these changes would not affect me, but I speak for a large majority of students in the College of Architecture. The removal of USAR and Construction Science is an unprogressive move. I love this program and find that my peers would agree with me.

---

USAR students are a valuable resource just like any other student we picked our major to have options and not because we cant make a choice that we slack on other major we have a hearty load that we do just like any other students and we have to take two minors and study abroad we are students here don't try to treat us like we are not.

---

The new proposition by Mrs. Banks is not a proposition it is a blueprint that is already underway, she is not a true aggie and does not have any sense about tradition, she should take in the opinions of actual aggies not her ego.

---

This report is a joke and needs to be revised like crazy. I disagree with everything that was proposed and think that this report needs to be made more aware to the students. The most absurd thing that this report could have proposed was Rationale #9a. I am a USAR student and am disgusted that the writers described every USAR student as some distraction to the college and does not have qualifications or interest in a college degree program. "To ensure that each College focuses on its mission and are not distracted with students who do not have the qualifications or interest to enroll in a College degree program, the University Studies program should be unified in the College of Arts and Sciences." This is a shame and disgrace to all of the USAR students. We are not distractions and unqualified, I think whoever wrote this proposal is such.

---

-I disagree with Construction Science being moved to the Engineering Department. I believe the current program for Construction Science students, like myself, is perfect to prepare us for the future in the construction industry. I believe if Construction Science needed to be pushed out of the Architecture Department, then it should be it's own department.

---

This seems like a very political move and it has not been well thought out. Personally, as a Construction Science student, I believe that I have gained so much knowledge and experience with the cosci department lying in a smaller school such as architecture. A lot of us students have worked together to create the best culture we can in this department, another reason why it's the number one program in the nation. I personally feel like the phrase "If it's not broken, why fix it?" really comes into play here. We have become a very sustainable and strong program through this school and there is absolutely no reason to change the way we've been operating for so long. Approximately 30% of our cosci students are first-time college attendees along with being minorities and it is a huge step forward in making the program/school more diverse. Through having cosci in the architecture department, students who have fought for an opportunity to earn this major have more resources with less students to compete with for attention when it comes to academic excellence and help. I have received the best help from my advisors who only focus on us cosci students. With a more general system for advising in the school of engineering, there would be less help accessible for us cosci students. We aren't just numbers, we are your students who chose this major for a reason. With this information, I hope you make the right decision and keep this major in the college or architecture for future generations.

---

Having a centralized academic advising service simply will not work.

---

Again, I believe removing OPAS and the art galleries from student affairs could remove fundamentally important opportunities for student involvement. These organizations give students all over campus professional experience that they wouldn't otherwise get.

---

One of my greatest concerns with Student Affairs is how funding for FLARE, or Freshman Liberal Arts Reaching Excellence, and LASC, Liberal Arts Student Council would be handled if the College of Liberal Arts, which provides a large amount of funding for both orgs, would no longer exist in its current form. Both orgs provide great support for liberal arts students as they transition from high school to college life. This support has led not only to my personal success, but also the success of countless other students.

---

n/a

---

Recommendation #2 negates a core aspect of student development at Texas A&M. Texas A&M is known for being

student-led and that is often a selling point for students wishing to attend our university. My decision to come to Texas A&M was based on our traditions, which are mainly student-led. Additionally, much of my personal and professional development is due to my leadership opportunities in student organizations, academic organizations, and more. It is important to note that student organizations already have a staff/faculty advisor, as required by the Department of Student Activities. This recommendation is extremely vague, as we do not know the extent to which students will lose control to manage our organizations. Switching to a completely staff-led approach (rather than a student-led approach) threatens to limit the development of students through hands-on learning through leadership positions in student organizations. Many of our organizations are 30 or fewer students and do not need extensive oversight. The ones that are larger in size or more visible by reputation almost always have more than one staff/faculty advisor who work closely with students in decision making.

---

Tamu should stay and operate the same. No changes.

---

More funds should be diverted towards hiring psychiatric professionals, as A&M is currently unable to handle the vast influx of students requiring serious mental health care. CAPs is doing its best, but is overwhelmed due to lack of staffing (especially of psychiatric staff) and lack of funding

---

The report says it is "integrating and importing services that facilitate students' academic and career success" to Student Affairs yet it removes OPAS from Student Affairs even though OPAS gives students unique learning opportunities by allowing them to work with professional productions. These opportunities obviously do facilitate academic and career success.

---

AGLS 235 has been an extremely useful and informational course. It has been a top resource in bettering my financial skills as a young adult in college.

---

n/a

---

The groupings do not make any sense. The Becky Gates Children's Center has no reason to be lumped with the University Galleries. This needs to be looked at closer. Also, one Associate VP should not have 7 different departments under them when the others only have 2-3. This makes it seem like you are trying to lump everyone who is different, from those who are minorities to the disabled and veterans, over in the corner. You are showing the students that you do not care about our needs or about diversity as a whole.

---

They are in good standing.

---

No comment

---

n/a

---

I do agree that there needs to be a stronger review process for high-profile student organizations that are extremely public or far reaching (like Aggie Fish Camp, Aggie Transition Camp, Big Event, etc). We as student leaders do need to be held to a higher standard to represent A&M as best as possible. Too much oversight of all organizations would be overly time-consuming and might limit the capabilities of some organizations, but it is definitely needed.

---

I personally have not felt that there have been negative implications of the current organization of student affairs. I feel that reorganization would impose new and perhaps unnecessary challenges that would trickle down to my experience that were not initially present.

---

No opinion

---

N/A

---

I think all these options are extremely vague and ridiculous to try to determine the outcome if it isn't clear. If you want a more specific answer email me and I would be more than happy to go through this with someone and point out the flaws in a lot of these options.

---

I support the move of Counseling & Psychological Services and Student Health Center to TAMU- Health if it continues that students have free access to these services. It is critical that all students have equal access to health services on campus.

---

This all seems reasonable. Related to whether or not students are getting "life skills," it seems like a very basic way to promote this might be setting up a mentoring / tutoring program with graduate students and freshman (although would

need to be done carefully to protect students)

---

Students are already frustrated with the money grubbing schemes of A&M. To increase efficiency at the cost of student experience only increases this sentiment.

---

I am a student in the Political Science Department. I love the idea of merging it under the Bush School of government. My feedback is that I would love that it be done soon enough so that my degree can reflect that it is with the Bush School rather than under the College of Liberal Arts. Thank you!

---

They have no bearing on myself or my club, simply they give commands and a meaningless survey every semester, and provide no other support.

---

Asserts, without evidence, that centralizing Information Technology and Human Resources services in a university-wide manner would increase efficiency, timeliness, and consistency.

---

Howdy, My name is [REDACTED], and I am a member of the Aggie Class of 2024. I am also a proud student in the Construction Science Department. I would like to provide my feedback in this report about the proposed changes that have been discussed in the MGT report. When thinking about the proposed move of the Department of Construction Science I had a lot of questions as I know several of my classmates had. Would Construction Science become an engineering tract, would we be able to keep all our professors (including those without PhDs), would our head of department change? My classmates and I have been discussing our thoughts on the report circulating back to these and other questions. When I first opened the MGT report and started reading about the changes proposed to Construction Science I was shocked to see how little of the article was dedicated to supporting the conclusions drawn. I was also shocked to see how many students were listed as respondents in the first pages of the report. Out of 500,000 people, only roughly 1,000 students had a voice in this report. Furthermore, I do not know of one Construction Science student who was interviewed in the preliminary survey. How can this be? When thinking about this topic, I thought about what it means to be a student at Texas A&M. I thought of our core values: Respect, Excellence, Leadership, Loyalty, Integrity, and Selfless Service. How does this report fulfill any of these values for COSC students? I have felt betrayed over the last few days with the lack of information and transparency that has been afforded to my classmates and myself. We are proud to be Aggie students. We are proud to be in our department. I came to A&M not to blow off and waste four years of my life, but because I wanted to do something with my life. Construction Science has thus far exceeded my wishes in all ways pertinent to my desire to be a Contractor. I have felt the value of my education in ways I know other students at different Universities and Colleges know nothing of. I have seen the application of my skills readily in my life, and I have grown to appreciate even more than ever the Aggie network and its spirit. How does the proposed move value the Leadership exhibited by professors who might lose their jobs if the change happens? How does the change exhibit Loyalty to students who might find themselves in a forced change of major after working for years for their degree? How does this move value Selfless Service to the students of the Construction Science program who came to Texas A&M expecting to receive what was offered from the program? And how does this move represent Integrity when many students have voiced the concern that COSC numbers are simply needed for the Engineering program 25 by 2025? "The primary mission of the Department of Construction Science is to prepare students for successful careers and future leadership roles in construction and construction-related industries." I have seen this mission at work in my own education while here at Texas A&M. "In our department, we treat students like family." I have been thoroughly pleased with the Department of Construction Science and the skills I have been taught thus far. The program has aimed to prepare me for the workforce and to exemplify the Aggie Core Values. It is true that the program is equal to none. The sheer size of companies who are so readily willing to hire Aggie Construction Science students reinforces this point. I mean no disrespect to engineers or the College of Engineering, but the parts that have been so far the least helpful for the development of my skill set have been those classes in my major that most resemble engineering classes. That is not what my classmates and I came here to learn. The report said, "Moving the Department of Construction Science to the College of Engineering will enhance the educational experience and research potential for faculty and students in both organizations." I, personally, and a large portion of Construction Science students cannot see that being the case. Please take this into serious consideration. Thank you.

"TAMU Fish Camp holds much value for incoming freshmen in helping them develop an affiliation with the university, gain concrete knowledge about institutional practices and policies, and engage with other students. Such student

engagement practices for incoming students prepares them to navigate cocurricular experiences and challenges throughout their college career. It is important to balance student autonomy with institutional oversight, such that TAMU's values and traditions remain central, when helping to shape programmatic elements...Perception that TAMU history and culture have negatively impacted student body diversity. TAMU has historically been conservative and slow to change regarding diversity issues. Fish Camp is an example of this—there is a lack of control over the content of the camp. The challenges of polarized politics have the potential to threaten core values. " How does a "lack of control over the content of the camp" correlate to TAMU's historic issues in regards to diversity? Fish Camp's curriculum is built around the core values and resources that Texas A&M offers and to say that there is a lack of control over the content of the camp is an insult to both current and past student leaders and who dedicate countless volunteer hours to the mission, vision, and values of Fish Camp and Texas A&M. Just because Fish Camp has values of their own, does not mean that they disregard the ones that A&M was built upon. If anything the core values of Fish Camp expand upon the core values of Texas A&M in a way that encourages respect and diversity, all of which contribute to developing stronger leaders who will change the world. The issues that Fish Camp is faced with is not only a Fish Camp problem but a larger problem that our whole university faces. The organization itself has lots of room for growth, but that is not how they are portrayed in this report. Additionally, if the university would like a larger hand in the curriculum and structure of the programming, they need to be ready to compensate these student leaders as is done for other traditional extended orientation programs or be prepared to hire additional professional staff. This report from my perspective seems largely based on outsider perception without much communication with student leaders and professional staff to create any level of understanding

---

n/a

---

I have been involved in Student Organizations throughout my entire academic career at Texas A&M. Having held multiple officer positions, including President, for on-campus student organizations, student organization management practices are extremely important. I think better training for student leaders could be implemented as well as better guidance for these student leaders. The philosophy mentioned in Rationale #2 is that student organizations should have the freedom to explore campus and make mistakes at almost any cost. To a certain degree, this certainly holds true. Learning from mistakes and having the freedom to explore is an important part of life. However, when these organizations make mistakes, and often costly ones, they are not held accountable or given the proper resources or assistance to make up for or learn from their mistakes. Balancing the control the university has while also giving organizations freedom is something that needs to be prioritized. Often, many mistakes that organizations make are not even intentional but come from a lack of guidance or inability to easily access the information needed to make smart decisions. Additionally, SOFC could use a significant amount of help and change. Having dealt with SOFC directly with my organization for over 3 years, I know firsthand that dealing with SOFC is something student leaders absolutely dread. It is not an easy process, instructions and guidance are hard to find and often unclear, and going to the SOFC office is often an inconvenient and unpleasant experience. SOFC needs to update its online instructional information to show changes that have been made since the pandemic began. For many forms, online options have been created, but there is no instructional information for these online forms which creates confusion and unnecessary stress, and trips to the SOFC office. In my personal experience, advisors for student organizations typically take a more hands-off approach. They stay up to date on everything the organization is doing, sign the necessary forms, keep track of spending, etc..., but they are not heavily involved in the organizations and are often difficult or impossible to track down for physical signatures on forms. This is one of the many benefits of online forms. However, for certain forms, you must still fill out a physical form, get original signatures from a student leader on the signature card and the advisor, and then go into the SOFC office in person. This creates an insane amount of stress for students who already have enough on their plates. Online forms and updated instructional guidance can fix the majority of these issues and improve the workflow of both SOFC and the student organizations.

In different as long as they aren't liberal

---

A&M has repeatedly harmed student affairs through moving it off main campus, making it difficult to reach emergency services, and similar actions. Psychology services need to be accessible to students in disability services and victims of

sexual assault. This move makes it harder to reach a those services.

---

n/a

---

N/A

---

I think the COSC department should be moved to Engineering

---

I agree with Recommendation #3.

---

Construction Science is a unique field that does not belong in the College of Engineering. Construction needs all the business classes as most of us will go onto to control construction project finances. Also, most of the structure classes we have now are way too advanced for even the jobs we enter. Engineering classes will provide absolutely no benefit to Construction students entering the general contracting world. The college of engineering and what Construction Science teaches are two separate things that should not be included together. Engineers job and construction do not mix even on a jobsite as engineers don't build actual buildings, construction guys are the ones on the job building buildings.

---

I think the university should not manage student orgs. Many orgs like the independence of being able to run their own org without interference from University. Maybe a compromise could be offering trainings, guidance for orgs that do desire to build up leadership. But some orgs at TAMU are not formal, they are silly clubs that do not necessarily need to focus on leadership. Also I like the movement of CAPS to SHS, but where will this service be housed? Beutel? Beutel is not big enough to hold all of these services.

---

I have not gone to or been in Fish camp, but it confuses me why the Accounting firm counts it as such a threat. Everyone I have asked about it liked it the way it was, unchained and allowed to be freer with its actions rather than tied to a strict code of behavior.

---

I don't really have anything to add here.

---

recommendation 3: Although i'm not sure how the consolidation of TAMU health services would work, I definitely think that CAPS needs to be expanded and Rationale #3 about providing long-term care/counseling is particularly important. We do not have enough counselors on staff at TAMU to provide help to all 71,000 of our students.

---

I respectfully think that there shouldn't be a merger of departments or libraries.

---

Don't have any

---

Student affairs is convoluted. There is no two ways about it- while tamu boasts about how many organizations it houses the fact remains that some are inactive but haven't been deregistered as an official organization or university approved organizations aren't adequately protected from duplicate organizations being formed. The reorganization proposed to give more leadership and oversight are needed immediately after to ensure students enjoy them and remain safe during participation.

---

Fund the arts please! I'm an Art Minor and it breaks my heart to see that you are not funding the art minor. Growing the Arts at Texas A&M is suggested in the report and you are doing the exact opposite! Please fund the College of Arts and Science! I would like more access to art classes and I also want more students in the future to have the chance to be art minors as well. I know I'm not the only student at Texas A&M that wants to minor in art. Please show us that you value the Art Minor and the Arts by allowing us the funding to hire more faculty, use more classrooms, and more supplies. I truly love this program, please fund it.

---

Everyone I know and talk to within my peers all agree that this is not a good idea for the students of the science college. This is disrespectful and undermining towards the difficulty of our degree. This only benefits the liberal arts college and brings down relativity of the science in terms everyday application. I hope you take our comments into consideration.

---

Fish Camp should remain STUDENT led. This is what makes it so successful. We as students can relate to the freshmen coming in and we are actively changing, modifying, and coming up with new ideas each year to better their experience. Our process we use is effective and more university involvement could hinder their overall experience. The university can help us train in green dot, stand up, etc. but overall should be hands off.

---

The College of Science SHOULD NOT be consolidated with the college of Arts.

The recommendation to consolidate into four large colleges is alarming and saddening. I desperately urge the university to reconsider the benefits of smaller colleges, particularly in regards to student retention and recruitment, faculty and student wellbeing, diversity, and research. As a geology student in the College of Geosciences, I speak for myself and my peers when I say this will remove the main reasons students come to A&M for geosciences. When searching for colleges in high school, I originally ruled out A&M out of fear of being swallowed up in a large school. Upon touring the campus, the familial culture of the College of Geosciences, the small class sizes, administrators who know you by name and are willing to bend over backwards to help all endeared the A&M to me. What was unthinkable became my first choice. Many of my peers chose A&M solely because of this. By removing this significant benefit, you will be losing a large portion of prospective students resulting in a lower overall caliber of student recruitment regardless of your efforts to better it. Now a senior, I love the College of Geosciences administrators and advisors, having been able to build personal relationships with them that the large colleges cannot boast. If we are merged, many of these stellar administrators will be laid off or overburdened by the addition of many times more students and a wide-even hodge-podge- collection of majors. We here in geosciences can trust our advisors to know us, our personal goals and struggles, and know they will do everything in their power to help. Not so in the other colleges. In the College of Engineering, for example, advisors do not even know the students faces and the relationship is stiff and cold. I have known many engineering majors struggle to get help in applying for classes, learning of resources etc. because their advisors are so overworked. Merging will only exacerbate the struggles of the larger colleges while dragging down the smaller. This lack of support will inevitably lead to higher dropout rates and mental health struggles. Students like me will feel more isolated, not less. We identify not just with the university as a whole, but as a college with its own unique culture that will be lost with a merge. This move will also harm diversity. It sounds counterintuitive at first, considering the College of Geosciences long struggle with diversity. I make this claim primarily in regards to scholarship. Geosciences is a college with lots of funding due to our important research and participation in IODP. We pull in well more than our weight, especially compared to the arts. The college takes a significant amount of grant money brought in by professors to aid in scholarship and facility development. For our professors, it makes sense that this money is taken as it will be fed back to their own students and facilities. If it is shared with the liberal arts, which brings in much less money despite its larger size, the cut of money being fed back into researching, funding earning students in the College of Geosciences will be harshly reduced, resulting in a lasting decline in productivity and therefor income. Scholarship money is already spread thinly in our college as it is, and it is a significant help to those students who can get it, particularly minorities. If we merge with the Colleges of Liberal Arts and Sciences, our money will be redistributed away from us as we are a much smaller number, yet more prolific college. Our scholarships will be reduced further to accommodate this reduction, pushing poorer students and minorities away from the geosciences when we should be striving for the opposite. Additionally, the merge into a College of Arts and Sciences will hurt the image of our colleges. When I hear arts and sciences lumped together, the first thing that comes to mind is weak science. Is that what we want our university to represent? Prospective science and geoscience students want a college tailored to them and their needs. Think also of the college specific Living Learning Communities (LLC). These, specifically the Geosciences LLC as I was a member and peer mentor of it, strives to welcome students, give them a community of students with similar interests (the geosciences) and teach them things that are useful to know in their fields. An English major wants to learn aesthetic writing while a Meteorology major needs to unlearn that from high school and learn technical writing. Research, job searches, interviews, types of classes are all vastly different. LLCs are able to specially design their courses to best help their specific students. The LLCs and colleges know this and tailor their resources accordingly to best fit their students. This helps both the students and recruiters in promoting our familial image. Loss of high quality applicants could even lead to the loss of IODP, a major source of pride and income in the College of Geosciences and unique to us in the entire western hemisphere. Even risking its loss would be irredeemable damage to our image and recruitment. Art and science are both noble fields, but are too different to reasonably combine. One or the other will suffer as what is beneficial to the arts will harm the sciences and vice versa. Are such minimal benefits as the convenience of a few upper administrators really superior to the wellbeing of faculty, staff, and students? Has a single person wished their college was larger and less personal? I think not. There are other ways to insure consistency of values across the colleges without merging that will not result in lower enrollment, fewer scholarship opportunities, higher dropout rates, worse mental health and community. Reducing spending is no use if it results in an even larger loss of income. Because of my strong love for this college and university, I beg you to reconsider.

---

General Ramirez needs to be removed. As a former cadet, I know personally that this person is not fit to hold the position of VPSA. He does not deserve to be in charge of these important parts of the university, and leaving him

anywhere near the Corps of Cadets is doing all of the cadets a disservice. General Ramirez is nothing more than a man who has some leadership experience and is really good at selling himself. Please remove him. Please. Please. Please. P.S. I understand that this message comes across as a single former cadet who has it out for General Ramirez, but I assure you that is not the case. I know many former cadets who can speak to the fact that this man is not fit to lead and should honestly not be associated with TAMU. I am saying these things because I genuinely care about the Corps of Cadets and the University as a whole.

---

Stop wasting time on DEI initiatives and start spending it on bringing high achievers to campus, REGARDLESS of their race/class/gender/etc.

---

"From the outside looking in, you can't understand it..." This sign is in every single Fish Camp room at Lakeview. It is a phrase that is constantly used by Aggies when others try to demean our unique traditions amongst other typical Aggie things. We stay in line with our unique traditions because we see the benefits of them. The way Fish Camp has long been organized has yielded nothing but spectacular results for the student body. See any student survey taken over their time at Fish Camp. The results are overwhelmingly positive in practically every single aspect of their experience at Lakeview. This is in large part due to the passion and drive that the people working for Fish Camp have, along with the general passion these people have for Texas A&M. These people are students. There is risk in absolutely everything. If the only reason Texas A&M wishes to combine Fish Camp, the nation's largest led student organization, with university staff is because of risk associated with students running the nation's largest led student organization, then maybe you should re-consider how you admit students. Rather than placing the blame on us, place the blame on who lets us be leaders in the first place. Or on the other side of the coin, we are completely capable of being leaders. Because we are Aggies through and through. Have this conversation with people who have been a part of Fish Camp and who have been affected by Fish Camp. Having this conversation internally with people who are from the outside looking in, well they just won't understand it. [REDACTED]

---

I am conflicted on moving the TCMG program to engineering technology - if TCMG is moved, shouldn't MIS be moved as well? I think both programs offer students outside of engineering an opportunity to study technology without necessarily having the rigor of engineering courses. I think the faculty in engineering technology are better suited to teach and handle TCMG courses, but it will definitely be a culture shift from recognizing TCMG as an "easy" major to one of more rigor. I would expect that TCMG students in the college of engineering go through the ETAM process the same as all other engineering students to maintain the prestige of the college of engineering. Expanding student health services into Texas a&m health is an absolute must. It may be possible to collaborate with the medical school on this to provide even greater reach into the campus and the community.

---

The MSC could have been handled more efficiently. I have already filled out a survey for them. Please make it easier to book rooms on campus.

---

None

---

Saying that Fish Camp doesn't encourage diversity is ridiculous. Everyone I've ever spoken to has loved fish camp and it made them feel so much more welcome here. My counselors and co-chairs promoted not only physical diversity, but diversity of thought. Also the fact that the report doesn't mention the Corps at all when there is a distinct lack of diversity there is really quite strange to me. It seems like they're misplacing the "blame" of the lack of diversity on Fish Camp instead of on the Corps which is one of the most longstanding parts of A&M's culture. Little has changed in the Corps to promote diversity. There's never been a female Yell Leader, and they just had the first female bass drummer in the Aggie Band. So it really is quite mind-boggling to me that we're saying Fish Camp doesn't promote diversity.

---

Agree on moving caps, shs to tamu health. they could also employ some medical students here

---

none

---

The corps is not an all male, military organization. The corps of cadets is the only thing holding the traditions of the university together. In my opinion not enough time, money, and effort is given to the corps.

---

I agree with all these points. Recommendation #3 is vital in this changing world and mental health issues. There were many suicides while I was in school in the late 90's and my best friend committed suicide in 2019 due to mental health issues.

---

This is the section that I read, because it represents the issues I am most concerned with. I was a leader in Fish Camp this past year and recognize the delicate balance between organizational autonomy and Texas A&M's overall mission and

vision. However, as the report points out, this relationship is a 2-way street. The current administration (student affairs), does not seek to explain or have a conversation, they seek to mandate. These mandates do not come to students in the form of well-documented reasoning, they come in the form of statements such as "this decision is way over our heads", "I'm sorry, we have to follow what the university wants", or worst of all, "If we wanted to have a meeting with university officials there would be no way, they would never take time out of their schedule for us." These are statements our highest leadership has made about the relationship between Fish Camp and Student Affairs. How are we supposed to implement "contributive" organizations in an environment where university administrators don't care what students have to say? Universities of higher-education are supposed to give students real-world skills. We should be teaching students about the importance of organizational ethics and Aggie Core Values, not about the importance of conformity. I'm worried that this report unintentionally empowers the department of student affairs to continue bullying student leaders into submission, rather than teach them the necessary skills to find success in what they're interested in. Fish Camp serves over 50% of the freshmen class every year, so clearly there are political/marketing incentives to turning control over to the university. However, "Texas A&M University is a public university. As such, faculty and staff are government actors (also known as state actors). The U.S. Constitution and, in particular, First (freedom of religion, speech, press, assembly, petition), Fourth (protections against unreasonable searches and seizures), and Fourteenth (due process and equal protection) Amendment rights are guaranteed when government actors (faculty and staff) interact with individuals (students)." (Texas A&M Office of the Provost 2018). This means it is not constitutional for student affairs to dictate what student organizations do or say, so long as they are conforming to student activity rules. I am a first-generation Aggie, an honors student, a master's student, a teaching assistant, and I have been a part of many different organizations throughout my time at A&M. I love this school, and I love how much I've already grown here. But, I have been extremely disappointed in the findings of this report and the issues that they highlight in regards to Student Affairs. I feel as though Student Affairs prioritizes protecting the University's reputation over the betterment of student success, and masks this agenda by claiming that they are providing the "training and resources" to empower students to be leaders while maintaining A&M's core values and mission. They get away with this agenda by providing "cultural audits" and appointing advisors to large student-led organizations. These cultural audits are qualitative studies performed by in-house faculty all of which are under the same chain of command. The advisors are also employees under this same chain of command. There are no checks and balances, no accountability for the way student leaders are treated by the university, and no separation of duties. I urge the office of the provost to take another look into the relationship between university administrators and students, specifically at the way Fish Camp is being treated/bullied by the same university that it continuously chooses to promote. The consequences of allowing this behavior will be devastating to the student bodies' participation in Fish Camp, and in turn, the influence/reach that Fish Camp has on the freshmen class to begin with. There are also potential legal consequences to the actions of university administrators, "restrictions on the exercise of free expression are judged by the courts to be unconstitutional..." (TAMU Provost, 2018), and there must be a "compelling government interest" to create these content-based restrictions on programmatic elements. If the department of student-affairs is not careful they may very well end up facing a powerful lawsuit that is supported by supreme-court precedent if they continue to restrict student freedom of speech and expression.

---

I kindly prompt you to accept all recommendations. Your office ought to improve.

---

n/a

---

Most recommendations seem obvious, and I do not know why we were not doing this before.

---

N/A

---

NA

---

The College of Geosciences SHOULD NOT be combined into the new college of sciences and arts. The current structure should be left as is.

---

Student organizations do not need more structure from the office of Student Affairs, especially the Corps of Cadets. Students should be given the opportunity to create what ever organization they desire. The Corps of Cadets is already overly micromanaged. For the sake of "leadership training", the Office of the Commandant continues to mandate the removal of events or actions that raise moral. Morale in the Corps of Cadets has been on a steady decline for the past 2 years. Last year, 2 cadets killed themselves. This is not because their peers were too tough on them. The Corps of Cadets

has been building leaders for years and years. Each year, the training methods get more accommodating, yet there has never been 2 suicides so close together. The cultural problem with the corps is not that cadets are forced to work too hard. Rather, the large cultural problem is cadets are not allowed to have time for enjoyment after the work hard. They do not get to unwind or release the stress they build. The Corps of Cadets is not student led. While some of the mentors are wonderful, (Lt Col Washington, Lt Col Fleming, and GySgt Mercado are great mentors) many (many to most) of the men and women who are paid to mentor cadets running the "student led" organization through coercion. I am not complaining because I disagree with the staff. I am complaining because they simply restrict through fear and coercion anything they can find that they do not like. The staff do not practice the strategies they teach/ask of cadets and instead they use the strategies of which they accuse cadets.

---

If you really want to put more emphasis on student health, including student mental health. You should take a look into all the curriculum, work, pressure being placed on students combined with social expectations and self-preservation expected. Make changes based on those results instead of just creating a dedicated unit to provide holistic student health. Mental health is declining exponentially in students due to new requirements and expectations being placed on us with changes in curriculum due to zoom and in-person options leading some people to believe a greater workload is reasonable. College is important but it should not take over a student's whole life. This is coming from the perspective of a senior mechanical engineer that is getting a chance to breathe for the first time in 4 years.

---

N/A

## Student Affairs - Former Student

Please provide your comments related to Student Affairs:

I think one of the strengths of Texas A&M is its strong student organizations. Students learn valuable leadership skills from organizing and running these organizations. These leadership skills are what sets Texas A&M students apart from students from other universities. By trying to limit these organizations and have administrators decide what organizations should exist, we would hurt one of the major strengths of our student body. A university should be a place to share ideas and explore different ideas. By letting students control what organizations exist, we ensure that the organizations reflect what student think are important.

---

Recommendation #1: Absolutely reorg as the report recommends. I cannot imagine how so many unrelated areas got thrown under the SA umbrella. Of paramount concern is Aggie Fish Camp. Note I said "Aggie Fish Camp," not "TAMU Fish Camp." All of our incoming students (AND faculty!) should attend a Fish Camp in which newcomers learn how to be a Texas Aggie--not just "a student attending Texas A&M." There IS a difference. (Same for existing or incoming faculty who have no clue of our unique heritage and traditions, all of which create the extraordinary Aggie Spirit which carries over into our worldwide Aggie Network.) My volunteer work with Aggie students over the years has given me a great opportunity to hear first-hand about changes at Fish Camps. They have become disorganized and morphed too often into platforms for students with special "causes" to sermonize and proselytize their agendas, not the fun yet instructional programs they once were. Greater guidance and oversight by A&M staff are required immediately.

---

Clarifying and energizing the responsibilities for Student Affairs would be very positive.

---

I think most of the suggestions in the section seem good & beneficial on the whole. I would also strongly encourage A&M to provide and possibly even require some personal finance education. I would also advocate for the university to find some way to be officially linked with Bonfire again. While cell phones and ear buds have certainly played a large part, I think not having that unifying student-body wide project and event has played a massive role in the decline of the friendliness on campus. Ideally bonfire would return to campus somewhere, in some form, but at the least the two should be officially linked/endorsed/sanctioned.

---

Recruiting of new undergrad students is great but all of the University must support!

---

I was an advisor of a TAMU student organization for several years, and was disappointed in the transparency and accountability, even if the students were doing what they thought was the way things were supposed to be done. There needs to be better management, training, and guidance given by the university to student organizations, and if this

cannot be done adequately then the number of student organizations should be reduced.

---

Fish Camp needs to keep its uniqueness in that it is not a typical new student orientation, but rather is a student-run organization that instills the TAMU core values and lays the foundation for becoming an Aggie in a special setting off-campus and with students leading the programs. That's why over 6,500 freshmen want to attend. It's the first place that a freshman learns about the uniqueness of Texas A&M, our values, our traditions, and what it means to truly be an Aggie. The bonds created between the incoming students and the counselors/chairs is not replicated at any other institution. Having attended as a student 34 years ago and as a namesake 2 years ago, I was profoundly inspired by the impact that it has on incoming freshmen and on the upperclassmen who spend immeasurable hours preparing for the camps and pouring themselves 110% into it.

---

student and organization behavior, academic and otherwise, should be held to high standards and perpetrators punished accordingly. students should be safe on campus and at events. the Honor system office needs more staff to uphold the Aggie code of honor and the value of the degree.

---

It is an embarrassment and a stain on the character of Texas A&M that the student affairs has hosted events on campus with adult entertainers. Drag queens are disgusting, obscene, vulgar, and demeaning sexualized portrayals of women. One of the drag queens featured graduated from A&M and went on to represent my alma mater as a drag queen in Houston area bars. How embarrassing for the alumni! I graduated from TAMU and drag queens do not reflect the character of the university I graduated from. Drag culture is full of kink, erotica, fetishism, drug use, and prostitution. Student Affairs needs to do a better job of promoting a tolerant environment on campus where Christians and conservatives are welcomed. That is not the case now. A catholic group offered a scholarship for a student with a child at the university and intolerant leftists at the university tore the flyers down. Christians are routinely harassed and called names on campus and they are being silenced rather than being encouraged with vigorous debate. Recently, I attended a conference on national security and learned my beloved alma mater is now a major recruiting center for anarcho terrorists such as Antifa and other organizations. That is due to the progressive propaganda and atmosphere on campus. We no longer donate to the university because we are ashamed of what it has become.

---

This MGT survey was an abomination. Pushing the narrative further to change the campus and overhaul it to be another run of the mill university. What gives Texas A&M its strength, power, and future, are the very things that make us unique. Curious how none of the universities we were peer/compared to are even in Texas. These comparison universities are beneath us, or different entirely, in the same manner as milking a cow vs milking a bull, and the complaining that your milk tastes differently. Cherry picked data to justify hitting Texas A&M with a banhammer and to alter the university, remove its identity, entirely. People say that what we identify as matters, well Texas A&M identifies as Texas A&M, and if you refute that, you're a bigot and are dismissing the lived truth of A&M. Yes the College of Engineering is huge, as it should be. Advising is decentralized, governed by each major, as they should be. You'll never have a one size fits all approach, and trying to shove the university and its respective colleges into a "big box store" feel, as this report would suggest, destroys the very fabric of what makes us Aggies. Trying to shove in 25,000 engineers by 2025 risks diluting down the degrees or simply put, dumbing down the curriculum to pursue more students.

Additionally, merging the College of Fine Arts and Sciences, as many smaller east coast schools do, does not make sense nor enable either entity the ability to perform as unique and necessary institutions on their own. If you wish to improve the university, might I recommend cost saving initiatives like never paying for another such a slanted and asinine survey again. Perhaps considering cutting the University Administration's salaries by 10% as well. Speaking of cost savings, DO NOT outsource student on and off campus transportation. The current model makes sense, and such outsourced services at other universities always ends up being more expensive in a matter of a couple of years than any immediate cost savings might hint. You will pay more, get less, and be confused as to why... Why was this even an option? Look at what happened with outsourcing dining services. Pursuing diversity over meritocracy, over talent or the outcome, is a fool's errand. Diversity should be cultivated organically and naturally, not forced and mandated. Diversity is great, but chasing metrics and numbers over anything else and rejecting the notion of assimilation while encouraging the students to celebrate what separates us is not healthy. Change for the sake of change simply to change and virtue signal will not yet results, will not bring us together, and will not continue the ability of A&M to be a natural melting pot. Let talent speak for itself, and let those who wish to join A&M do so freely. The desire to erase campus landmarks to resemble west coast university appeal also does not sit well with me. Remarks about the Corps of Cadets being "too Caucasian" is not only insulting to our diverse group of Cadets but a surface attack on the Corps' rich history and selfless service. Creating more commissioned officers to the US Military than all the service academies combined should tell you that the

Corps has the ability to form the talent, respect, and love for each other that is required in a military environment. The Corps of Cadets, and the College of Engineering, are fine examples of successful melting pots creating cohesion and powerful leaders. As they say, Highway 6 runs both ways. If faculty, administration, or students, do not like Texas A&M, they are free to leave whenever, and can go attend or work for a university more aligned with their emotional support needs. Those who wish to be Aggies will be Aggies. The University has thrived for a century and a half being run the way it is... Forcing us to change to be similar to UCLA or Maryland will destroy our identity. I say this as a First Generation Aggie, who came not from wealth, but a family of poor immigrants, refugees, and poverty. As the first in my family to go to college, A&M represented everything I aspired to pursue and be. I took on tremendous debt to break the cycle of poverty in my family. Texas A&M was the beacon to freedom, and it still is. The desire of the MGT survey however risks undermining that legacy for the Boogeyman fighting game of "equity" and "diversity and inclusion" while throwing out the University as we know it. I strongly believe the MGT Report offers the chance/opportunity/paper thin justification to radicalize and change the University to better suit the political leaning aspirations of those who dislike Texas A&M.

---

I concur with the report findings.

---

Howdy, My name is [REDACTED] I am a Construction Science graduate from the Class of 1997. I write this in the brink of my re-entering the workforce after a 15-year hiatus to raise my children and take care of my elderly parents. I start work for Zachry in five short days. I have always worked in engineering when I was using my degree. I worked for Fluor Daniel and for Lockwood, Andrews & Newnam performing project controls. In those years, I had to often correct people who thought I was an engineer and explain that "my degree is in Construction Science which is in the school of Architecture". It got old not being able to claim that I was an engineer, even though I worked in the industry. At times, it made me seem less than my co-workers even though my role as a team member was just as important as their roles. So, with that being said, I personally would love to be called an engineer, but I don't know how that plays with never being able to develop from EIT to PE and so forth. It's a missing link. So think about this if you change the curriculum as to how this will be labeled. Would we be Construction Engineers instead of Construction Science graduates? There are many career paths that come out of the program. I know there are many graduates that go to work for construction firms as opposed to the path I chose. Should this be a path within the program, kind of like a minor of some sort? I really would have liked to have obtained a business minor when I was there, but it wasn't an option at the time. Later on, I hired a graduate of the program who was able to obtain that minor. I know things change, and I know that President Banks has been very successful in helping engineering students complete their degrees, more so than people in her previous roles had done. I often wonder if she had been at the helm of the engineering department when I went through A&M if I would have been able to complete my original plan on becoming a Civil Engineer. I was discouraged by my departmental counselor at the time and changed my degree to Construction Science in the middle of my Sophomore year. He told me that, "Some women were made to bake cookies, and some were meant to be engineers." I encountered a couple women throughout my career who also had this same advisor and received the same message. It is refreshing that this mentality is no longer tolerated at the university! My concern would also be for the students who have already begun their Freshman year at the University or within the University system (ie: TAMU Corpus Christi) who were working toward a certain GPA to get into the program if that requirement would be raised in the midst of their efforts which might seem unfair if the bar was changed in the midst of this. Engineering is challenging to a level beyond Construction Science. I hope this degree is still obtainable and a safety net per se for the kids that might not be able to be at Engineering caliber, but still are decent students and have potential to contribute to society at TAMU Construction Science graduates in the future. I might not be able to rightly call myself an Aggie Engineer today. I leave that title to those who cut the mustard, but I have no shame calling my self an Aggie Constructor, and proudly wear my Aggie gold. I know I still have a lot to achieve with my degree, but I hope that if you do change the program, that it doesn't become so elite that a student similar to myself wouldn't be given the opportunity to experience this program. I think that Engineering is the way to go with this degree from my experience, but it definitely shouldn't have an exclusive GPA to get into the program. While the structures classes are rigorous, it definitely doesn't have the math and science components that the other engineering degrees require, and it doesn't need to. I got what I needed to be able to do what I needed to do from the program. Scheduling and cost control courses have been key to my career in project controls. Best Regards, [REDACTED]

---

Students and student organizations should never be silenced if their cause is worthy. Cancel Culture should not be

permitted to exist on campus

---

Very impressive during my time and also now

---

Student online classes need to be eliminated.

---

Rec #1 - I support the movement of departments from Provost to Student Affairs. I support the movement of CAPS from Student Affairs to Texas A&M Health provided that this leads to an expansion of services. We CANNOT continue to have suicides because the "wait time" to see a counselor/advisor is at its current levels. Rec #2 - I support ONLY if the finance procedures are practical. The current process is overly burdensome with 50+ pages of instructions, which has led to an underground cash/venmo/paypal process for many student organizations. This is VERY risky and ripe for skimming/fraud. Rec #2 - I do not support the dilution of Fish Camp nor having Fish Camp "fall under" a structure like Aggie Orientation Leaders. Part of the value of Fish Camp is the leadership development since it is a student led program. I find the AOLP leaders say what Admin wants them to say (are puppets of Admin) whereas FC leaders provide students with more honest feedback regarding first year experiences. I agree that there needs to be oversight and professional supervision for Fish Camp, but this could be accomplished with addition of another Advisor to share the workload. Rec #3 - Counseling services must be expanded as we CANNOT continue to "accept" suicides. TAMU needs to leverage telehealth partners and weave these into earlier sessions so that students view telehealth partners as an extended resource rather than a "lesser" resource.

---

I have seen first hand some of the activities of Student Affairs. Most if not all of the activities need to have more adult guidance as some do not seem to support the mission, messages, and values of the University. As stated in the report, the Corps of Cadets is "part of the universities culture" and is the corner stone of "the Aggie Spirit" and traditions that make A&M unique and special. When someone thinks about A&M, they think about the Aggie Spirit, the 12th Man, AND the Corps of Cadets. While the Corps is only about 4% of the University's population, they are the PUBLIC FACE of Texas A&M. Overall, the Corps is more diverse than the rest of the University. They, more than any other student organization, are the epitome of Respect and Selfless Service, two of the six core values of the University.

---

Student Affairs SWOT Analysis Did the consultant visit the MSC night when all clubs and organizations , over 800, have booths or on line websites which discussed their organization and its goal or mission? Did they look at the website of clubs / organizations Did the consultant visit any organizations like the MSC, Student Engineers Council, Engineering Honors ECOS program, church student organizations, Big Event, Engineers Without Borders, Build, Women Engineering Society, African American ( Black) engineers Society – we have the largest black engineering society organization of any school in the USA of schools that are not predominantly Black) , Indian dance clubs, Latin America clubs, Intramurals ( A & M has the largest such program in the USA) , etc. It seems to me the consultant did not collect enough data to learn about our inclusion and diversity at A & M. We need to strive to do better in everything we do, but diversity is a problem that begins in pre-k and shows up greater the higher the class of education. The consultant should be intelligent and experienced enough to know this. The question to the consultant is, what percent of all students, by race, sex, religion, etc. are academically college ready at 18? We want all students to achieve success when challenged, not fail. We have learned that students from any background scoring less than 32 on ACT math or 1250 SAT with a min 650 on math will not earn a degree in engineering. In fact, a 675 in math is really the minimum to major in the more difficult majors of engineering such as mechanical, computer, electrical, aerospace, biomedical, nuclear, materials, civil, etc. Galveston and Qatar SWOT Analysis No Comment, except the Qatar campus provides a great experience for students visiting QATAR or from QATAR visiting A & M College Station. And it increases diversity in Qatar for women education. Student affairs. After the re-organization, I doubt I would want this position. What responsibilities and authority are really left for the Vice President of Student Affairs? It is not described well. There are already key people in charge of these tasks and there does not seem to be enough job duties remaining. This is not a job I would want because there is not enough left in the proposed student affairs organizational chart. One could not have enough impact at A&M.

---

I agree with the recommendations for Student Affairs reorganization.

---

Recommendation #1: Reorganize Student Affairs and expand student “High Impact Practice” (HIP) services. Agree. Recommendation #2: Align student organization management practices to ensure transparency and accountability. Agree especially with the focus on upholding Aggie core values not emphasizing political viewpoints and excluding students based on their political views. Recommendation #3: Integrate Student Health Services and Counseling and Psychological Services into Texas A&M Health and establish a dedicated unit to focus on providing wholistic student

health. Agree.

---

Both recommendations make sense and I believe would improve student life and experience particularly from a social point of view.

---

Report compares percent of minority students to student population. It does not factor in the percent of minority students who do not finish high school. This is a major problem in the population which shows high school drop-outs being the highest percent of the population incarcerated. Affirmative action has proven to be a poor program to bring in minorities that don't meet university standards. More work needs to be directed at improving the graduation rate from high school.

---

Good suggestions on how to enhance the student's success and experience while at A&M.

---

I chaired 2 different MSC committees in the 80's and used the skills from those experiences much more than anything from my degree. While the Fish Camp sexual assaults are inexcusable and the culture needs an overhaul (why are counselor piercings strongly encouraged?!), not all organizations need such oversight that the student leadership learning environment is diluted. Room to make mistakes should be allowed as part of the experience. Dictatorial rules and regulations should be avoided.

---

Agree with new structure of student affairs.

---

Take more care for diversity and supporting clubs who promote diversity and inclusion such as in the DMS.

---

No opinion

---

All recommendations seem to be positive. One item I did not see is protection of 1st amendment rights in this. This may not be the proper place but our country has issues currently where people of differing or conservative viewpoints are shouted down and face abusive situations from faculty and other students. Is there a place where this can be addressed?

---

No comment.

---

a. Recommendation #1: Reorganize Student Affairs and expand student "High Impact Practice" (HIP) services. i. Finding 1: Agree. b. Recommendation #2: Align student organization management practices to ensure transparency and accountability. i. Finding 2: Agree. Very good recommendation. c. Recommendation #3: Integrate Student Health Services and Counseling and Psychological Services into Texas A&M Health and establish a dedicated unit to focus on providing wholistic student health. i. Finding 3: Agree.

---

I defer to students and student-oriented faculty and administrators. However, I would note that it is not clear why student life and residence life should role up into separate VPs or why student life studies (whatever that is) should be housed separately from student life. I would suggest considering whether the functions required could be consolidated under 3 VPs instead of 4. Regarding Recommendation #2, I strongly support holding student organizations accountable to "real world" management practices. However, this should NOT result in diminished responsibility, opportunity, or scope for student activities. For example, one year I was involved in SCONA (Student Conference on National Affairs). It was my responsibility to recruit speakers for the conference and to raise funds to put on the conference. We were given information and tools to accomplish these objectives, but the burden of making it happen was on us. I strongly believe this is a critical developmental opportunity for students. I would not support taking the responsibility away from students to ensure HIPs are achieved. Part of what made Texas A&M unique when I attended was the degree to which they let students take responsibility for running student organizations. I do not know what it is like today, but figuring out how to meet my responsibilities to SCONA at A&M has stuck with me as one of my life-long accomplishments and learning opportunities. If you can call up someone at a company, make (and keep) an appointment, give a fund-raising pitch, and answer questions for a student organization you'll be set for job-hunting or sales meetings for the rest of your life. Definitely hold student orgs. to high standards, but do not take this "life skills" opportunity away from students just to meet benchmarks.

---

Expanding financial literacy for the Money Education Center will be a worthwhile investment. As a former student and worker of the Money Education Center, it has changed my life for the better. I am financially more knowledgeable in a family where money was always a problem. For the many students that experience this, it will be essential that they know they have access to the Money Education Center. The people that work there are passionate about improving

one's financial situation and/or financial knowledge. That is what makes the Money Education Center stand out.

---

We'd hate to see the Corps disappear

---

The university should highly consider the recommendation to combine mental health services with physical health services.

---

I do not feel qualified to comment on the details of this based on depth of knowledge, there should always be continuous improvements made to meet the needs (and changing needs) of students in today's world. I hope that a critical assessment of what is being done in this regard will be done to ensure the students' needs are being met.

---

A young Inspiring Architect should always support team involvement

---

The report's results match my experience of earning my master's degree in the College of Education several years ago. Professors regularly stated, without regret, "I don't know how that is done. See the secretary she can help." If professors don't know how things are done, that is not good for their colleges. To be fair, the systems were so convoluted that they had a right not to know. However, if your professors don't take ownership then it makes for an inefficient system which the report shows.

---

I would like to see a bigger emphasis on broadcasting and communication programs. We need more Aggies on television to help promote our great university. We often are lacking in this department, and with the University of Texas joining the SEC, you know they are going to add former Longhorns to their on-air talent on platforms like the SEC Network.

---

I think it is a travesty that the VP of Student Affairs no longer lives on campus. I found it interesting that this section indicated "we have a more diverse student body" when other sections lamented that we were woefully unrepresented. Hmmm. I think OPAS should remain under the MSC/Student Affairs. Otherwise I am in agreement with the recommendations.

---

The Former Student heavily involved with Student Affairs and as a Former President of the Federation of TAMU Mothers' Clubs (Aggie Moms), I dedicated my year to the Division of Student Affairs and have a passion for this area as it is often known as "The Other Education". Most of the changes seem to be well thought out and logical. It is my hope that the core reason will remain in place and that is the development of the whole student outside of academics. In addition, the release of Dr. Danny Pugh, VP Student Affairs, seems premature. His experience and expertise would have been invaluable in the outlined restructure. Perhaps the position will have less responsibility with the divestiture of many of the areas as outlined.

---

An important segment of the University. But a challenge with the 1200 or so organizations in how to provide leadership by the advisors who supposedly oversee/support each organization. Statement that too little guidelines for leadership in the organizations means things happen that are not "advised" by advisors and as a result problems occur. Freedom is important, but direction and leadership by the active committees in each organization must have more attention by the advisors. Reorganization of functions as suggested will help. Keeping Corps of Cadets as a strong students organization under Student Affairs is important for the overall image and tradition of Texas A&M. Reorganization Chart makes sense.

---

I was horrified that football and track athletes physically threatened elderly former students near the Sul Ross statue July 2020. The track athletes were escorted by a handler paid for by the university and were driven in a golf cart provided by the university. I have video of said abuse and threats. The pandering to those who hate Texas A&M has got to stop.

---

Totally agree that undergraduate students require more in the way of solid counseling and mentoring. The centralized approach to Career Center Counseling and recruiting opportunities has worked out well. And we do have well-meaning and often effective Departmental advisers--the problem is that they are really overloaded. There are gems such as Dr. Holly Gaede at the Department level and we need more like her and make sure that students can access easily at the freshman and sophomore levels. The undergraduate experience in Science needs much more exposure to the "outside world" and work experiences through internships/coops. It is important for a Science undergrad to find a vector for pursuing their coupling of talent with desire--understanding what they are good at and where their passion lies--and what the work environment will be.

---

PLEASE PLEASE PLEASE PLEASE PLEASE PLEASE keep A&M a CONSERVATIVE school!! Texans need to have that as a choice for their children. There are plenty of other choices if you want a liberal school. PLEASE keep the A&M

---

conservative values in place. This DOES mean that all are welcome; no one is excluded AND A&M keeps the conservative values. My husband and I are Aggies ('91 and '92) and have FIVE A&M Students ( '18, '19, '21, '23, '23) and we are so very sad to see the crumbling of A&M conservative values in recent years. We have raised them to know that ALL AGGIES are valuable and ALL AGGIES are important and you treat ALL AGGIES with kindness and respect. And yet the divisiveness brought by some groups is ridiculously allowed by A&M. The loud, over-the-top, intrusive, disruptive cheering nonsense that is allowed at graduations needs to stop. Parents are prevented from hearing THEIR OWN CHILD'S NAME called because of it. They really have earned that small right to hear their own child's name announced as they cross the graduation stage. Please impose a HEFTY fine on anyone who prevents others from hearing their own child's name called, AND ENFORCE IT. We have even seen parents miss the view of their child crossing the stage because these selfish individuals are dancing and jumping right in front of them. Heartbreaking and WRONG. PLEASE get rid of Alvard and all he stands for. PLEASE look carefully at what Fish Camp counselors are teaching.... Fish Camp grew worse and worse through all our five children's attendance there, and was an unmitigated disaster for our youngest two. If we had more children to go to A&M, Fish Camp would no longer be a part of their experience, sadly. In fact, we wish we could say we still recommend A&M to others when they ask us how our experiences have been with our children there since 2014, when our first went with hope and enthusiasm to A&M. Let's suffice it to say that we are watching carefully and praying that the A&M we know and love will return.

---

CAPs and Health services needs to be together. It should have been done years ago as those two departments go hand in hand.

---

I understand the report is recommending great things for the Money Education Center. I encourage the university to move the Money Education Center to Student Affairs and expand their efforts to reach students as the report suggests. I support the expansion of the Money Education Center. I feel as if it could reach more students and allow them to take the Foundations of Money Education course that the staff teaches currently. Therefore, positively affecting the next generation in financial education.

---

As a former student who was part of the founding staff for a student organization and a member of several others during my time at TAMU, I would caution against putting up too many organizational guardrails which discourage the creation of new student organizations or inhibit the ability of existing student organizations to operate organically. During the process of founding the organization which I helped start, myself and the rest of our founding staff ran into significant obstacles which prolonged the founding process for our organization and limited our ability to truly flourish within our academic college at first. At times, it honestly felt like that TAMU did not have our back, despite the University frequently encouraging students to take initiative and ownership in the founding of new student organizations. Over the next two years, our organization did grow, and this leadership experience served as a significant professional and personal growth opportunity for myself and the rest of our founding staff. I am thankful for the opportunities which student organization involvement brought me, and frankly, I want current students to have the same experience. I do definitely see the value of providing a degree of oversight for student organizations to ensure that the Aggie Core Values are upheld and that the activities and conduct of each organization avoid any potential pitfalls (particularly legal or financial) which could cause harm for the University as a whole. However, I believe that the ability for student leadership to experiment with new ideas, succeed, and fail, is important in providing the professional and personal growth opportunities which sets a former student of TAMU apart and pushed them into greater opportunities post-graduation.

---

I agree that Fish Camp needs more oversight for consistency of program and agenda.

---

Important. We need to draw the best and brightest, challenge them, help them grow up, and assist them to graduation. I am against the diversity program if it brings in kids that do not have the ability to handle the brutal grind of a top tier university. I am however, very aware of kids that may have one parent and work during high school to support the family and have an A-B grade point. They need to be admitted because they have already proven themselves. Retention is also good use of state funds.

---

I don't have a strong opinion on this section of the report. The recommendations laid out are fine with me.

---

The Veterans Service Office is extremely beneficial to veteran students. It has shown immense improvement over the last few years and is a program that should be highlighted about TAMU approach to this student.

---

There are several concerns in Appendix 2: SWOT Analysis that reflect poorly on the credibility of the Report. None more than the 3rd bullet point: "The Aggie culture impinges upon the potential for change within the university. The notion of

an all-male, military component of the school impinges upon the culture of higher education." Texas A&M has been open to female cadets for almost 50 YEARS (1974)! That is not an oversight, but NON-FACTUAL. Texas A&M has been recognized, nationally, as the "friendliest" campus in the country. The 7th bullet point claims, "Student Affairs is unorganized...". From Silver Taps to Aggies CAN Drive, to Red, White and Blue Out recognizing 911, to The Big Event, where several thousand students, annually, spend a day providing minor repairs, lawn services, clearing lots, etc. for citizens of Bryan/College Station. All Student led and organized. Events and many others don't happen with an unorganized Student Affairs.

No specific comments.

Finding #1 - This recommendation appears to be a good one. Finding #2 - The recommendation is very good and much needed. Finding #3 - Okay.

The recommendations seem reasonable and appropriate, but I cannot profess to have any real expertise or experience in this area.

Without question, most of these recommendations should be implemented.

Na

The report mentions that the corp is an important part of Texas A&M but then says having an all male military unit is not a good idea. The corp has not been all male in years. Also, the corp are the keepers of the spirit and the traditions and were started with the corp. Without the corp, Texas A&M would be just like any other large university and would not be unique as it is now. The report states that the school is historically conservative and that is correct. The reason is we want it to be conservative so we can send our kids to get a conservative education. The only reason that would be viewed as a negative is if the researchers are liberals. They are trying to change the culture and having reports performed like this is one method of doing that. Texas A&M is larger right now than ever and can not accept all the students that want to attend. I don't see a reason to change. This is what happens when you hire non Aggie professors and appoint a non Aggie as president. As long as the old Ags are alive, we will try and keep Texas A&M supportive of traditional values focused on God and country. Eventually, the liberals will win due to indoctrinating kids in public schools and Texas A&M will be just like tu and that will be sad for the State of Texas

Streamlining student affairs to focus on the specific high impact areas that are most important to students makes sense to me. In a school as big as TAMU, it's easy to get lost in. I also think aligning student org management in a transparent way is great. Student organizations are so important and a great part of TAMU, but supported orgs with accountability structures are healthier for students and campus culture.

Support 1, 3... collaboration & transparency

No comments

None

I've seen more and more division in the student body of late. I believe this is fueled much by some school traditions. For example, if you don't partake in "Aggie tradition" you're considered a 2%er. This is placing a lable on the "other" when the "other" may not have a choice in not partaking in Aggie traditions. The world is getting smaller, it's time the student body embraces the differences in people. The university should help facilitate this starting at orientation, fish camp, etc.

No Comment other than the Corps of Cadets at Texas A&M is an extremely vital part of Aggie culture and history - that NO former student wants to give up. The Corps of Cadets may be small in percentage of overall student enrollment but is the largest and most visible segment of any at Texas A&M. The Corps of Cadets should remain as such and not get overshadowed by any other student organization on campus.

No comments.

Sounds right.

As with other campus organizations, Student Affairs, should be reviewed periodically to see if it is meeting the changing needs of students. A quick review of the proposed changes looks like they are headed in the right direction if supported by the faculty and administration. One watch out for is to ensure that the department is operated to develop an individual who can operate successfully in society as a citizen and employee or business owner. As students should gain

both an employable skill and life skills from their college experience, the department should ensure that students are given the guidance they need to hear. In a way, Student Affairs is the on campus parent of these predominantly very young adult students.

---

Better advising is essential to support students future goals

---

The Journalism degree should be kept under the department of communications as the two disciplines provide complimentary instruction for students wishing to pursue promising careers in media, advocacy, public service, and corporate affairs. I fear the lack of a focused journalism degree will diminish opportunities for students wishing to pursue such a major at TAMU and look to other schools such as UT or UH that have dedicated journalism programs. I minored in journalism and went on to attend the Bush School where I graduated in June of this year. I find my journalism background very helpful in my career as a Public Policy consultant where I worked with tech firms such as Salesforce, AWS, and AT&T to build out their government affairs framework. The practitioners, professors, and administration within the communications department are well-versed in curriculum related to media, communications, and journalism and, I believe, the best to be teaching the subject at this university. Please keep the journalism degree under the department of communications so students can receive the top-tier instruction needed to pursue the career of their dreams.

---

I concur with the proposed recommendations.

---

Where did you get the idea that the Corps of Cadets is all-male?

---

The student affairs need to rely more on the feelings of the majority of the students and not the extremists.

---

Students are losing the culture and history of Texas A&M - one of the strongest elements that have led to the growth and success of the University.

---

Reorgs based on consultant input - not interesting at all.

---

The goal of shifting student organizations' mindset to more of a "contributive" mission is very insightful, and one which I think all Former Students would support, as this would have the desired effect of promoting "...a common ideology about the campus and community."

---

I like the proposed changes which seem to treat students more as clients and less as products.

---

Agree some and disagree some. With Corps of Cadets included in it, I offer a comment. The Corps provides to members, those with military contracts and those without military contracts, opportunities to learn about taking orders / abiding with orders / giving orders, living disciplined lives, caring for others, being accountable, being respectable, being followers / leaders, being dependable, and living the Core Values of our University. Because of that, they are in huge demand in the business world, as well as in the military, because they are far superior to those who do not live the Core Values. With Office of Undergraduate Recruitment in it, I offer a suggestion. See my comments at the end about Aggie culture, etc. If this new office is created, then it could carry out the duties of "explaining and selling" Aggie culture to those who know little about it. This group could effectively, if prepared properly, inform prospective students, and the parents, about the tremendous advantages Aggies have when seeking employment.

---

N/A

---

As a former student of Landscape Architecture, sister to a brother who studied Construction Science, and a friend to many Urban Planning, Architecture, and Visualization students, I adamantly OPPOSE the breaking up of the College of Architecture into new departments. The synergies between all of these departments have given me a unique position in my workplace that other graduates from other universities do not have. The cross pollination of Science, the Built Environment, Art, and Landscape are not only required for a robust knowledge in each discipline, but need to be ENHANCED within the College of Architecture. Visualization students need to depict convincing and engaging landscape and architecture as new and exciting environments are explored through creative mediums. Landscape Architecture and Architecture students need the creative energy that Visualization classes provide. Firm knowledge in Construction Science allows designers to create more functional spaces, while close proximity design informs construction students of how the impact of what they are building transcends safety, health, and welfare. As a Landscape Architect, I work with Architects, Planners, Contractors, Artists, and Developers in my everyday work. To remove one from the College of Architecture would provide a weakening of program knowledge across the board, and would not adequately prepare

students for the real world. Such a suggestion demonstrates that the University is entirely out of touch with the work that this College demonstrates and the high caliber of performance that these students perform. As a student, the most influential classes I had were classes unrelated to my major as they strengthened my understanding of the breadth of the built, natural, virtual, and cultural environments. Not only would it be horribly inefficient for all of these departments to duplicate their courses, but silo others within funding efforts.

All the recommendations should be implemented

Agree

I like the recommendation to move the Money Education Center under Student Affairs.

I would love to see the Money Education Center fall under Student Affairs. It is an incredibly important program that I think would benefit from being under Student Affairs.

none

Terrible.

Texas A&M has many fine traditions, most of which grew from and are center around the Corps of Cadets. The report implies that many of these traditions run contrary to the objectives of student diversity, as if it was a given that diversity (meaning racial, ethnic, and gender diversity) is a noble, constructive objective. It is neither, and anytime a university applies resources toward achieving it, there will be some students, faculty members, or members of the administrative staff who will, of necessity, be discriminated against if their race, ethnic background, or gender runs contrary to the university's model of what diversity means or if they can be identified with an over-represented race, ethnic, or gender group. Texas A&M should focus no attention and allocate no resources toward achieving diversity as the term is now defined. I notice that the report treads lightly when it comes to assessing the Corps of Cadets, but the comment about Fish Camp negatively impacting student-body diversity suggests a strong bias on the part of the authors against Corps traditions and Corps practices, especially those like Fish Camp, which focuses on character building. One gets the idea that the authors shied away from saying what they really think about the Corps, likely in deference to the strong feelings that many deep-pocketed former students hold.

The reorganization & Focus of the Student Affairs office is needed and welcomed. A number of suggestions in the report seem to be heading in the right direction and you definitely have the right man for the job (General Ramirez). Oversight into Fish Camp and MSC organizations definitely need overseeing. It is incredibly important that we oversee programs that current students invest their time in. These are critical places where Aggies learn what it takes to be an Aggie... the core values. Once we lose that we are no longer making Aggies... we are churning out degrees. I have often said to my AFS rep that we are watering down the brand. In pursuit of 'world class' status we are admitting more and more students to our university and we have outgrown our ability to instill our Aggie Core Values. Many students cannot even hope to join an organization as it is too competitive and there are only a limited number of spots. Students come here as hot shots from their high schools looking to join and become one. What they get is a 'sorry, we don't have any slots left'. This makes for a lonely freshman, far from home whose academic progress is his/her only achievement. Many give up and go home. It doesn't have to be this way. How about we stop accepting more kids than we can house, teach, feed and accommodate via programs. Student health, student involvement are important but it's the belonging that schools students and turns them into lifelong Aggies.

Recommendation 1: This doesn't pass the sniff test. Was the outcome of the study determined before or after it was conducted? That sounds harsh, but it sure looks like it to me. Recommendation 2: Oh hell no!!! Enough of this... see "General Feedback"

No comments

The discussion on diversity and how our traditions may make it more difficult to connect with a diverse student body was very interesting. If we can do things to improve the situation without losing what it is to be an Aggie, I am all for it.

Change and better organizational efficiencies are a desired outcome, but make it fit TAMU.

While it is desirable to have many experiences, the idea espoused by the social workers in that there must be diversity and match population of students to state percentages accomplishes nothing but number crunching. Ask why it is so critical to match the population - what does it achieve? Again having worked in areas where the employment population

was required to mirror the work age population in the geographic area resulted in significant sub-par performance (hence costly wasted resources and delayed production output, terrible work attendance and higher injury rates. Again, this is another social engineering buzzword - we must have diversity and match the population - maybe some of that population isn't qualified or capable of the academic workload and this now discriminates against those who are capable, just to meet some social goal.

Recommendation 3 for Texas A&M Health in merging the health services and psychological health services I believe to be long overdue. One general center would be greatly beneficial for Aggie students.

The university has a loyal following of its own. Its reputation is not as great to outsiders with respect to diversity and inclusion. The tradition of friendliness and support for one another should be expanded to students of all races, financial backgrounds, and the LGBTQ community.

My biggest disappointment over the last several years is that there seems to be a lack of supervision over student groups. This has created division over the campus and has turned many students away. My biggest concern was Fish Camp. Fish Camp is a life changing experience. It is what brings Aggies together and teaches them the culture and tradition and how to become an Aggie and to practice our Core Values. Somehow Fish Camp became a sexual orientation, coming out camp. Students walked away confused, frustrated and lost to what A&M represents. This is unacceptable. The Student Affairs Staff did not appear to know what was going on. I do know that now corrections are being made. But in all organizations, staff does need some oversight. The College Tours led by students was also promoting LBGT during the tours - unacceptable. The students giving tours were not able to answer campus history or provide correct campus information to prospective students. Better training to students, and having a staff member tag along to assist the student as they learn the position.

I had the chance to pick up a Battalion last week and to say I was shocked would be an understatement. This must have been written by the DEI staff at the university. The COVID insert sounded like it came from a high school student that never set through a biology or basic science course. I expected much better from a university that has a medical school. I am very disappointed in the direction that the university has taken under the last president. The university is starting to seem like a joke. Where are the serious faculty advisors. Respectfully, [REDACTED] '77

Diversity equity and inclusion are most definitely valuable but as long as we don't focus on one group and in that process we make another group suffer... religion, race, etc. anything. Find a balance and don't bow to political or social pressures.

Liberal arts and Sciences need to be separate departments. LA deals in subjective reality while the sciences deal in objective truth. Their perspectives on reality couldn't be more opposite or incongruous. Sciences deal in research that is funded by corporations that liberal arts has no way of relating to much less has any business courting for funding. Support for science students will be undermined by this maneuver and the future of sciences at this university will be compromised and eventually cease to exist.

The concern expressed about students obtaining the knowledge needed to be successful is valid in my interactions with students over the last decade. The main issues I've heard students and Aggie parents raise is access to mental health services and academic counseling (which was mentioned under a previous section). The number of mental health providers and the knowledge and number of guidance counselors needs to be improved.

Recommendation #2 & 3 - Yes

I strongly encourage the Corps to be treated equally to other student organizations and not held above the others. I am class of '76 and female and the Corps mistreated us horribly and do not represent the student body as a whole. We are more than the Corps and greater than the Corps.

Do not make any of these changes. A&M is better than the "peer review" schools so why do we want to lower our standards to meet them? This was a total waste of time and money!

None

Enhancing the student experience for all students while at A&M should continue to be the focused goal. They should be as healthy mentally, physically and emotionally as possible while attaining a degree. I'd proceed with caution about just how far this is taken in training those who lead student co-curricular programs such as Fish Camp. If it ain't broke don't fix it. What seems to be broken that there is mention of Fish Camp more than once or twice? Tell us so we can respond. It's traditions such as these that have made instant connections and friendships for incoming freshmen so that a large university can immediately feel smaller. It's the information regarding our storied past and the encouragement of

finding their niche in the thousand different organizations that will give them that well rounded Aggie Core Value experience. Again, we are Texas A&M and if you get too carried away with overseeing all student activities with some agenda and without allowing the creativity and leadership to shine in our upper classmen who lead these programs, you'll lose the character of the university and transform it into just another large school like all the others.

---

Student Affairs need a lot of work. While encouraging student leadership and allowing them to make mistakes is very good, there also needs to be more adult supervision, so that the student activities are consistent with the Aggie Core Values.

---

Agree that advising needs to be strengthened and made more accessible to students.

---

Not a fan of the report. I sometimes feel as if this generation is the most whiny group I have seen. Yes, we had a problem with racism, misogyny etc. instead of sitting around dwelling on this why not focus on positive things like how can we get our students jobs? How can we do better in advising students on majors? How can we encourage them to find their niche in a large school? I need more Dean Koldus from the 80's and less marching. I need more real ideas on how to reach out to the lonely kids. I need less preachy judgmental people and more with fresh ideas. I need less "woke" and more now to succeed. I need more "be careful to not post drunk photos on FB" because employers look you up. None of my kids went to A&M. My middle son got into CS. He had a perfect math score was top 20% and wanted to be biochemistry and CS but they were so far away from each other it was almost impossible. He's shy and smart and felt overwhelmed by A&M. Why is Biochem not by all the other sciences? Why are the advisers so terrible? Why was our tour of the dorms so awful in February? The chemistry professors were AWESOME.

---

I am very concerned that the SWOT analysis identified the Corps as an All Male Military Organization. This is such an uninformed input. I'm shocked that it was highlighted in the top level SWOT. If this many inputs are that WRONG, then we need to relook the Marketing and Communications at the University level (internally and externally)...and how to better promote what the Corps of Cadets is accomplishing for its members as a crucible of leadership and for the university. I am glad to see Joe Ramirez moving to the Office of Student Affairs as he can help re-orient this gravely inaccurate perception. Student Affairs will benefit from redoubling its effort not only to provide opportunity for all students to participate, but to promote the merits, benefits and value which these organizations bring to students not only in their years at Texas A&M, but that they carry with them into the future to build their own communities and add value to the Aggie Network. I'd dare say that the Corps of Cadets is the standard bearer to be regarded as a uniquely valuable asset to the university, the nation and to the stellar reputation of the university. I don't mean for this to be a marketing campaign for the Corps, but the military is still a very well respected institution and Texas A&M contributes more officers than any other institution beyond the Service Academies. I see in TAMU commercials and advertisements less emphasis (or no mention at all) on this core institution. I don't believe the Corps is right for all students, but I do believe that all students and former students benefit from the reputation of RELLIS which has so often been exemplified throughout our history by former members of the Corps of Cadets...and the vast majority of students and former students take pride in the uniqueness of the Corps. We should harness this publicly as an asset (not the sole asset), not try to shy away from it or minimize it.

---

The suggested reorganization of Student Affairs functions make sense from a university and functional area point of view. While there would be benefit from bringing people and units with common purposes and functions together into an alignment of functional purposes, it may not serve the student population as well. Students, as the focus of the university, should be able to contact an office which has the broadest range of resources possible in a single, or small number, of locations. If the units/staff with the varying purposes can benefit by an organizational alignment along functional area, that will serve them - but their location and resources should be located together across the functional areas in a place where students do not have to track down help in three areas across multiple locations.

---

Once again, seeing how many 18-22 year olds you can get money from seems to be your top priority. You have lost your direction. I never attended Fish Camp due to physical limitations but I knew what it meant to be a true Aggie. There are currently roughly 3 out of 5 students on campus believing we are just like every other state university. They do not know the Aggie core values nor do I bet they even know the Aggie code of honor. It saddens my souls to see how the powers that be are allowing the downfall to continue. It is an utter disgrace how athletic money/potential takes precedence over others. Last summer it was beyond disgraceful how athletes were not punished after being on film yelling at law enforcement calling them four letter words while walking past them on George Bush. Why? Because the started qb being reprimanded would have meant a possible loss which meant less money for ol Texas A & M. Not something that would have happened under different leadership years ago. Texas A&M University is a conservative school. A proud

conservative school. The reason so many of us choose to attend. What current leadership is allowing to happen by ways of student organizations getting away of the conservative morals is disgusting.

In the appendix, the following was noted: "The Aggie culture impinges upon the potential for change within the university. The notion of an all-male, military component of the school impinges upon the culture of higher education." Plainly, I find this statement ignorant. It's hard to see it otherwise. Firstly, the Corps is not all-male. Even my beloved outfit, F-2, was integrated shortly after my graduation in 2011. The women of the corps go on to achieve great things. That said, I do believe there is significant value in all-male organizations. I grew up only seeing my father for 21 days out of every year, and without significant male role models. My 4 years in an all-male outfit taught me lessons and gave me experiences that a near-fatherless upbringing had denied. I'd argue there is great value in retaining all-male spaces. Secondly, our country has four military academies that are academically prestigious. There is no general expectation that a military component, in any way, harms an academic culture. The Corps has taken many positive steps to improve the academic success of cadets and recently has exceeded the University's general GPA as proof of its effectiveness. For many students, military discipline and structure helps them achieve their potential as students. I was the academics officer of my outfit as a senior and even in 2011, we took grades quite seriously. Many of my classmates and underclassmen have gone on to wildly successful engineering careers. The Corps is an undeniable strength of Texas A&M, and it ought to be championed as a "leadership laboratory" that is unique in America. As a cadet, we were largely left to run our outfit as we saw fit. We were directly responsible for the well-being of our underclassmen. That type of leadership experience and responsibility provides unmatched development. In my case, I've gone on to found a successful personal training studio with a six-figure income - by myself. I withstood the pandemic and my business came out stronger. I doubt that I would be so successful without the strengths I earned as a leader in the Cadet Corps.

Stop this diversity and inclusion madness. You are wasting money and teaching the wrong thing to new generations.

N/A

I agree with the report recommendation to reorganize Student Affairs and expand student "High Impact Practice" (HIP) services.

Moving out the departments mentioned makes sense, but adding new departments seems ill conceived.

XXX

As stated earlier, as an active duty family with a veteran connected child enrolled at TAMU I do NOT support moving VSO to Student Affairs, but in this particular comment I would like to focus on the movement of various areas to TAMU Health. I would certainly support this IF, and ONLY IF it made it faster and easier for students to access the services these departments provide. Currently, the wait for mental health services is far too long. Additionally, the campus health center cannot see students as quickly as they often need. If these moves don't bring better, easier access for students to services, then it absolutely should not be considered for acceptance.

Didn't have one when I was there - A&M was all male at the time. (Had to put a joke in here somewhere to test your sense of humor. A person needs a really good sense of humor these days!!!!)

With new leadership and the proposed restructuring of the office of Student Affairs, such ensuring seems insured. This idea of accountability to the campus community seems a great objective. And yes, manning the programs under the purview of Student Affairs with well trained leaders to uphold the culture and spirit are correct ideas. But going beyond these ideas would be to position already trained leaders within organizations who have not be able to meet the training and development needs of there own organizations. What is meant by this? If upper classman students from academic or governmental groups should be recruited to positions in other groups. A 3-year student leader in the SCONA program could be recruited to take the position of Residence Hall board, In this assignment, that person could bring ideas presented and discussed regarding diversity into local campus hall settings. Or a 3-year non-contract cadet could be recruited to be placed in the same or similar Residence Hall board or council position lending his organizational training experience. Student Affairs SWOT Student Affairs SWOT The TAMU Corps of Cadets cannot be fairly described as part of the CULTURE as it is described as part of the student body. AS stated, the CORPS is founded and exudes the culture. IT is the poster image. It should be noted that the band if often given the media presentation attention. The correct way to see the corps is with the band not of the band. The athletic programs by their nature get the media presentation attention and that will not end, regardless of what consult is provided. It's a economic fact. However. More should be done to integrate the programs and get the media from them. All sports should be pictures with the 12th man identified

as well as the numbered athletes. For example, rather than the picture of the team with the Home of 12th man sign in Kyle Field in the background, we should picture two students (one corps, one civilian) with two athletes showing the 12th man and the teammates. Other media messages seem more appropriate, but still needing improvement. The 5 students (one Corps with diverse student images) entering the academic building or walking around the library.

Recommendation #1 Again, the Corps of Cadets is and should be the best caretaker of custodian of traditions because its heritage is founded on the original and true culture already discussed. This rite does not elevate the Corps but relegates it into a servicing role. Other student organization can and must be granted this custodial responsibility.

Recommendation #2 - Student organization accountability is most important. The idea of service must be central to the way organizations are run by servant leaders not just the service that the organization provides to the campus or community. Goals, Objectives, and Measures can be made by each organization before taking the job, project, or assignment on. This is a trained process. Threats- The program called FISH CAMP as well as other Orientation Programs must present, represent, and reinforce the HOWDY CULTURE, SERVICE CULTURE, RESPECTING CULTURE, WORKING CULTURE, as well as the LEARNING CULTURE. A Curriculum for this must be developed, transmitted (through training and experienced) and measured for adjustments. This program will be for TAMU as important as any academic course and program of study.

Marketing and Communications #1 - Centralized standard messages about TAMU, its TEXAS LAND GRANTED RURAL MILITARY culture must be expressed the same way each time. This message, like a mission, vision and value statement must be seen or least a version of it on all major correspondences. And then the way we picture TAMU, the way we operate with each other and visitor must convey the HOWDY, SERVICE, RESPECTING, WORKING and LEARNING Culture. The bottom line already mentioned at the top is the Aggie (HSRWL) Culture is founded rooted and established and need not be changed. It must impinge on each and every person within the Aggie Community. Representing this highly valuable culture is the challenge for us to convey as Aggie culturist. Organizational Development processes along with Training and Development curriculums must be envisioned and constantly refreshed

---

Recommendations sound logical.

---

Agree with assessment, as a Veteran, not enough programs for older students.

---

The proposed realignment appears reasonable. One note of caution. The consultants appear to give too little credence to student initiatives and student-led organizations. Having led one of the more significant student activities on campus, I can assure you that my experience in doing so as it relates to the business/government real world was invaluable. I would also suggest that encouraging student-led initiatives resulted in a red, white and blue stadium subsequent to 9/11 and also has resulted in Fish Camp and the Big Event both of which reinforce TAMU's corps values. In order to gain the balance that the consultants recommend, the administration should encourage the faculty and staff to become involved in providing guidance to such initiatives rather than assuming control.

---

The report does not provide a cost/benefit analysis of the effect of these changes. In some cases, the offices may need to be moved physically to be in one location. It can be a very expensive proposition with no clear returns provided. Texas A&M University has withered the challenges of the last two years very well. I am not sure why such drastic steps are being asked. What will be the benefit?

---

Agree with recommendations.

---

None!

---

Turning student organizations into "semi-professional" organizations would be counterproductive because of the harm it would do to turnout. A common piece of advice for students is to "treat academics like a job," and many students do. This workload is doubled for members of the Corps of Cadets, as well as for students who actually work a job while taking classes. Already shouldering these responsibilities, why would a student take on a second or third job in a student organization? The resume padding just isn't that valuable. Simply put, student organizations need to be enjoyable to thrive (and in many cases survive), and the more strictly the administration regulates and governs them, the more job-like and less enjoyable they will be.

---

The second recommendation under student affairs regarding the oversight of student organizations is concerning in that it is a little vague as to what types of organizations would receive what level of oversight. When the idea of value and mission alignment is applied to organizations like Fish Camp, this model makes sense as it primarily provides a service to A&M, and a large number of ideologically and culturally diverse students participate in its activities. If, however, the same oversight model were applied to a student political or religious organization it would run a very high risk of

interfering with such an organization's ideological autonomy and, potentially, could cause first amendment issues given that A&M is a public institution. Given these and other potential issues, the administration should err on the side of caution and avoid a one-size-fits-all model if it attempts this kind of oversight.

The students need to learn the history of this great school and how it was formed. Fish Camp needs some faculty and Former Student oversight.

These recommendations should be considered mandatory. Currently Student Affairs owns too many non-related areas.

This is a huge department and I agree that closer oversight in some areas is needed. Such as fist camp.

None

I agree with the recommendation to move CAPS and Student Health Services to the Health Services Center. I would like to see administration look at the lack of a collegiate recovery program at TAMU. A collegiate recovery program is "a college or university provided program that includes a supportive environment within the campus culture. CRPs reinforce the decision to engage in a lifestyle of recovery from addiction/ substance use disorder. It is designed to provide an educational opportunity alongside recovery supports to ensure that students do not have to sacrifice one for the other"- ARHE ( Association of Recovery in Higher Education). Although Health Promotion has offered recovery meetings once a week and has done a few sober events, it is not enough for the largest University in the nation. We are one of the few schools in the SEC that does NOT have a CRP. I met with the VP of Student Affairs in early 2016 about the need for collegiate recovery at TAMU. I had the support of the Aggie Network, Aggie Moms, other CRPs across the state ( no rivalry in Collegiate Recovery!) and students who were wanting recovery supports. I'm passionate about this as I feel it could have changed the trajectory of my son's life. My son's scholarship, Brandon Rogers Endowed Memorial Scholarship, went to the Aggie Recovery Community. In August 2016, the Aggie Recovery Community was formed. It was a student led organization and was thriving until the strong student leaders graduated. It is now no more, yet the funds for this group are still in their student activities fund. Almost one in five college students meet the criteria for having a substance use disorder. In 2019, I was honored to be selected to be a Fish Camp Namesake. In my camp, I had 7 freshman come up to me and tell me that they were in recovery, one of my counselors was in recovery and 2 students had lost brothers to overdose. Multiply those numbers by 40+ camps and you see the need. I would love to see administration investigate the need for a CRP at Texas A&M and a student led recovery community - resurrect the Aggie Recovery Community. I have communicated with Health Promotion the need for more recovery supports , especially a full fledged CRP- only need their own space and a full time staff member, much like what is offered to our veterans, students with disabilities, LGBTQ, etc. However, student affairs and health promotion have not embraced the idea as " they don't see the need." The need is there and you don't have to look very far to see it. Other campuses have thriving recovery programs and communities and these students are leaders on campus and promote a healthy lifestyle. One of those campuses, the University of Texas at Austin, told the Aggie Recovery Community about a grant that brought a leader in the collegiate recovery world to TAMU and she made recommendations. She came for 2 days and I was there for day one. I'm disappointed that we are way behind in this area, an area where we should be leading. I feel that instead of Health Promotion housing recovery supports since they "don't see the need", that it be moved to CAPS or to a department that has an interest in those students. The students in the original Aggie Recovery Community are engineers, business leaders, doctors, etc. These students deserve supports as much as other students. I would love the opportunity to speak to higher administration personnel about the issue. My phone number [REDACTED].

See my comments below about our exemplary Corps and traditions.

I strongly advise that Critical Race Theory NOT be considered for curriculum, nor sanctioned, in any form at Texas A&M University. There is also no place on any Texas A&M campus for anti-American political, social or counter-cultural organizations. I ask with gracious humility that all departments, all faculty and staff, at all levels, remember our country was founded as one nation under God.

Put 12 step recovery program aboard the TAMUG training ship

Construction science must remain with college of architecture. VIZA could move to new college of arts and sciences, but a program specifically for architectural visualization and rendering should be created in its place within the college of architecture.

More diversity needed in this area.

The reorganization of student affairs and expansion of HIP services is outstanding. Recommendation #3 to integrate student health and counseling and psychological services into Texas A&M Health is logical and a good use of resources. Please consider changing all references to "psychological" and "mental" health to the much more inclusive and current term of "behavioral health".

See general comments for more details, but I do not find a sufficient rationale to support any of the proposed changes based on this report.

Advise tweaks that could be made to existing operations and organization to improve productivity and effectiveness. Would be far less costly and disruptive than junking existing...

General Ramirez is a gift to the University. I would take his opinion seriously and follow his lead.

I love the idea of moving student health services under college of medicine. I am in strong favor of the changes in realignment in student affairs. Especially facility realignment of management of memorial student center. (However keeping programming part of MSC within student affairs)

The support and growth of Corps of Cadets must be strong and encouraged. The Fightin' Texas Aggie Band is the best ambassador this school has, keep it marching.

Very good - particularly the observation that student run organizations need adult supervision by their (hopefully competent) advisors under the VPSA! This is totally unbalanced now and the VPSA as mentioned is working on fixing it. Fish Camp is a good example! The recommended realignments seem worthy of consideration. The comment in the SWOT about the Texas Aggie Corps of Cadets being "an all male organization" which blocking necessary change to Texas A&M University is not true, obviously biased and agenda driven and should be cause to withhold payment to MGT! You just killed any credibility you ever think you had with me by that stupid remark, and you should publicly retract it and apologize for it and retract it...DO YOUR HOMEWORK!

The text and the SWOT analysis seem ambivalent at best about Texas A&M's historic traditions and culture, and seem to come down on the side of seeing the traditions and culture as a barrier to overcome. I submit that the traditions and culture are what separates A&M from the crowd of megauniversities that are increasingly impersonal and stamped from the same mold. With higher education awash with woke cancel-culture there ought to be room for one university with traditional values of loving America, celebrating unity, and the uniqueness of Texas' heritage. I expect that is why the report recommends that staff take over student organizations rather than continuing to let student organizations be run by students.

I expect TAMU leadership to demand students to carry the TAMU torch. No different than we were encouraged 55 years ago.

I agree with recommendations 1 and 2 as consolidation and transparency are key to student involvement.

As a former student who floundered and desperately needed academic advising, and as a parent who has watched her Aggie '23 suffer the same fate, PLEASE bring the academic advisors together! Very few 18 year olds know with certainty what they want to do with their lives, and even fewer know the path to take to get there. Changing majors should NOT be so difficult. I have heard of students forced to leave A&M and go to another school because they had too many hours to be allowed to change majors. That is insane. I understand we don't want life-long students, but until the academic advising is stronger, we cannot expect these kids to go it alone. Shouldn't they be able to take a semester or two to explore different academic avenues and determine the best fit? Locking them in to a scheduled set of classes does not help anyone. Let them explore higher education possibilities and offer true guidance along the way. The frustration for first-gen students must be overwhelming.

For the most part, Student Affairs should be re-focused on A&M's recognized strength: its traditional core values. If that is accomplished through this reshuffling of responsibilities it is useful. There is significant risk to this primary objective unless additional hires/replacements understand and promote this. Academic preparation of student affairs professionals does not prepare young graduates for this.

SA is especially important at TAMU and key to many student's success. CAPS provides many services in addition to long term counseling. A complete re-org to address one issue at the expense of other services sounds like a poor solution to the problem. It is evident that MGT does not understand the scope of services that CAPS provides.

Can we avoid touting fish camp as great in a report of this magnitude when it was barely addressed about the sexual harassment and misconduct news.

Your #1 issue is that female students are unsafe in and around Texas A&M. They are discouraged at every step when they have been sexually assaulted by the Rape Counselors, TAMU PD, College Station PD, and DA's office. My child fought through anyway, but as a school district superintendent I have never been more disappointed in the handling of an issue. Then, when we got to the grand jury after the PD never picked up video tapes held by my daughters work or the complex it happened, or investigated at all without threats of exposure, we were told by the DA that we should sue in civil court, a case for sexual assault will never go through in criminal court unless it is a stranger jumping out of the bushes in Brazos county. This is after an admission from the other party. Ridiculous. The bigger issue is that TAMU's officers, the counselors, etc. discourage victims. I know longer believe girls are safe and not because of the attacker, but because of the system that doesn't support the victim. And no my daughter was not drinking, dressed provocative or any of the other things you think, she was doing the right thing and was attacked by a peer with 3 prior arrest who was the same age because she said no, multiple times to his advances. She didn't even kiss the guy, and he physically and sexually assaulted her...I know things can happen, but the system you have in place is ridiculous. When my daughter recovers fully and I can speak out without harming her, I will and I will speak to masses and be heard. Fix it now.

---

Let General Joe Ramirez run things like he did the Corps of Cadets following our Core Values to the "letters of RELLIS.

---

I actually disagreed with the report's conclusions in the Student Affairs SWOT analysis. As someone who benefited greatly from the relaxed and restriction-free nature of student organizations, I would be loathe to impose restrictions. In fact, it wasn't until this report brought it up, but in hindsight I am very impressed that I had positive, inclusive experiences at ALL student organizations I was a part of and tried out. I only regret not investing more time into them, as my academic experience would not have been complete without the generation of soft skills that these organizations provide. I would certainly have Student Affairs continue to monitor and supervise such organizations regularly, but I would continue to allow them to grow organically and provide leadership opportunities without being manipulated to do so.

---

These ideas are great.

---

Further to my feedback on academic alignment, "mainstream" consultants/peers suggest centralization and "governance" of student-led programs like Fish Camp. The freedom for students to govern without Big Brother micro-management is key to A&M's second education and reputation as grooming leaders/CEOs of tomorrow.

---

Don't take good jobs and pensions from the citizens of College Station.

---

I think that the University is headed in the right direction here.

---

Student services have long been indecipherable to students at A&M. Any attempt at reorganization gets approval from me, as does proper overview of student organizations.

---

Do not allow student orgs to be rolled under academic side. The greatness of A&M has always been the passion students have to run and develop programs and groups. To lead. What makes us unique is our Aggie Culture. Our history is not always going to be on right side, but that does not mean we should erase it. Guidance is needed, but careful to not take over.

---

The biggest thing, regardless of what you do, visualization needs more funding and more independence from the college of architecture. The amount of times we have had to fight the college of architecture to get our needs met was ridiculous. Despite every single person in viz requesting and needing to have extended hours to Langford to complete our projects, we were repeatedly denied and rudely told to leave while we were in the midst of finals week and NEEDED the computers to complete our assignments. The render farm is a vital resource to almost every single viz student and faculty, yet we were denied access to this need after hours (when most of us have the free time to work on our projects). And the lack of funding has forced many amazing professors to resign or retire, while the college of architecture has continued to fund older and less competent professors, without giving us the resources and funding (all of my coding classes were terrible, I can honestly say, I don't know how to code, despite taking 3 coding classes). Until the department of visualization gets more independence and funding, Texas A&M shouldn't have the right to brag about those of us who made it to PIXAR, Dreamworks, etc. The amount of times we have had to fight the university to get the resources to complete our work, made it difficult to focus on the tasks at hand. If you do decide to put viz in the new "Visual and performing arts" college, please make sure that the technical and science parts of viz are kept. If anything viz needs less art and more technically minded people. And make sure there is a focus on helping us FIND A JOB afterwards. As a former student, I felt like I had absolutely no support when I came to finding a job.

---

Recommendation #1: Reorganize .... Agree with integration and removal recommendations. Recommendation #2: Align student .... Agree. Student organizations need very close oversight and accountability. No BLM or other radical programs should be allowed on campus. Recommendation #3: Integrate .... Disagree. Mental health issues should be handled outside of the university system. We do not need to be wholistic.

---

Please do not lower academic standards to ensure minority students pass. This serves no one. If anything, have support set up to try and close the gaps for those underperforming students. But never lower standards to pass them.

---

I fully appreciate the double edged sword that the Corps of Cadets represents to the advancement of TAMU's academic and social quality and national standing. Having been in the Corps and receiving an Army Commission there I know first hand the conservative heritage that is truly a source of pride and one of concern for contributing to the enhancement of current and future generations at TAMU. Gen Ramirez has done wonders with recruitment and retention of students of diverse backgrounds and much work is yet to be done. I would like to have seen a more in depth analysis and set of recommendations about how the Corps' culture could evolve, maintain it's role as Keepers of the Traditions and shed the perceived negative connotations that still exist particularly in the minority communities.

---

As a former student, my experience today is with Student Affairs. I work with the Big Event Committee every year. I was involved in starting The Big Event WAY back in 1982. I come to The Big Event every year and try to be an encourager. I just want to say that in working with this group, I witness truly remarkable leadership development. It is so impressive to see what these students do. The unique culture of student leader empowerment is what makes this possible. The students are really in charge. I have no worries that this re-org will take away from that. I just want to mention it because it is so rare and such a strength of Texas A&M.

---

These recommendations make sense. Student affairs should be about students and their advancement and transition from the university. Allowing Texas A&M Health to take over student health services and counseling and psychological services would allow students to benefit from the best professionals in the industry, allow faculty to also treat students (saving resources hopefully), and provide potential primary care residency programs for medical students. I support this. In addition, Texas A&M Health already has a model to follow with its newly established Health Hub in Bryan and could expand to provide dental services for students.

---

As indicate above, the focus should be on the Students. While outscoring parts of the University system may be economically advantages to the University, the unintended consequences, or collateral impacts should be corrected. Regrettably, the entire system seems to have commoditized everything, including the students which I believe will have longer term ramifications for A&M.

---

During COVID, my son was extremely frustrated only talking to student workers about getting his major changed so that he would be able to register for the classes he needed. I finally went online to his field of study and emailed everyone listed online in the department. He got a phone call the next day and helped him out.

---

Most of the reorganization sound like just changes to increase overall efficiency, but Student Organizations should be largely left alone as they allow for true freedom of development by students themselves.

---

Student affairs needs to focus on leadership and other core AGGIE values, stop with the divisive CRT, race, DEI, BLUE, nonsense and work to build effective teams, emphasizes everyone's individual strengths. Stop the division.

---

No comments

---

Good!

---

Student affairs must be overseen with the purpose of eliminating students and/or faculty working in opposition to traditional values.

---

I love the idea of prioritizing areas such as the veterans services, money education, and career services. I either used those services or wished they were readily available while I was at A&M. I also really like combining the student health resources to make it easier for students to get help and holding areas accountable.

---

I was concerned about a statement in the report regarding opportunities and obstacles. I am paraphrasing here. It referenced our traditions and culture as being both a strength and an obstacle to academic endeavors. It once was acceptable to be an outstanding academic institution within the confines of an agreed upon defined set of cultural norms. The greatest example is how many of America's initial institutions of higher learning were church based. Academic progress advanced pretty well within those confines while strengthening students moral fiber as well as societal progress. I see nothing wrong with students choosing an institution of higher learning based upon two criteria; academics and culture.

Do your best to 1) keep students safe/healthy, 2) make sure that they learn as much as possible, and 3) have fun - in that important order!

Focus on Academics and educating students in "How to Think logically" and "How to Learn". Do not waste our donations and tax dollars on the most recent politically popular movements. Student Affairs should be a reflection of the student body as a whole, represented by students from ALL the various colleges and degrees. Historically, this has not been true and the students from the Business, Teaching, Liberal Arts, and Political Science degree paths have dominated the elections to the Student Advisory positions. A system where all the different colleges are represented equally would be much more beneficial. This would allow for the voices of all the diversified student body to be heard, and not just the more vocal degree paths. Science and Engineering students are not typically represented in the Student Senate because of the time requirements that these more academically challenging degrees require.

Seeing the impact that the Money Education Center had on the many students since it's inception, I believe the Money Education center moving into Student affairs will allow the much needed practice of financial literacy to continue to grow and be better supported.

MGT is wrong to recommend centralized command. That's how the Feds operate and it fails miserably. The Marine Corps taught de-centralized command and things got done much better than the other services and the feds. DEI (Division, Exclusion, & Inequity) is marxist and should be abolished from TAMU. Just teach not to discriminate and provide equal opportunity.

I feel that TAMU provides great clubs and extracurricular opportunities to students. I agree of the importance to focus on the wholistic health of the student population. There are a lot of international students, out-of-state students, rural Texan students, and clashing of lots of emotions and while under the pressure of academic, personal, and sometimes physical stress. How do you make a campus that can aid these students? A rural Texan student might not be used to big campus culture or be under academic stress. An international student might be worrying about visas, family back at home, and complete isolation. Each population must be cared for and know what is available to them.

Most of these seem like good ideas. I would caution that moving some of these functions into other stovepipes will mean that the students receive lesser priority since other institutional needs will become more important. Need to ensure they don't lose focus on why they exist at all. No students=no institution.

I am a former student and academic excellence adviser to Kappa Kappa Gamma Sorority. This sorority has been under scrutiny in the past for various reasons, and still the fraternity continues to grow each year. Although, I respect the continued supervision of our sorority by the University, I would also like to experience the continued collaboration of the two entities for the benefit of students especially women students.

I know several students including my son that have benefitted greatly from the work of the Money Education Center. It is life changing when a young adult (or any adult) learns the power of money and its impact on one's life. I believe this helps the financial health of our students and university. If moving the Money Education Center helps this work to grow, I am all for it. I believe every student should take their class!

Agree

1) There is almost no reference in the executive summary about improving the experience and service to students. This is alarming. It is THE focus. If one of the recommendations doesn't improve student experience, then it should be shelved immediately. 2) The reference to the successful outsourcing initiatives for dining and student residences are uninformed. I interact with students very frequently. They do not like the food, period. They also feel that the dormitories are managed in a VERY impersonal way and they do not feel like they matter. Parents echo the impersonal approach to dormitory management. You have problems to solve with dining and dormitories. And please do not reduce opportunities for students to use a Work Study program to work in these jobs. That is not beneficial to anyone. 3) Note that one of the services that should be improved is the food that is provided in the dining halls. You have over optimized this and the food isn't as good as it should be. This is key to student and parent satisfaction. 4) Read the references to DEI and demographics of the Faculty Senate for information, but be very discerning about what you actually implement. There may be some tweaks, but merit should still be the deciding factor in most decisions. 5) Regarding DEI, move forward very carefully. Everyone deserves a chance. But admission and appointment decisions must be based on merit. A&M is an inclusive environment. You just have to work hard to earn your way in and work hard to earn your way out with a degree. Don't lose that. For instance, why does the proposed org chart for the Academic and Strategic Collaborations elevate the role of VP Diversity over the Sr. Associate/Associate VPs of the other areas? To depict the role in this way is merely ostentatious virtue signaling and is not pragmatic or wise at all.

Are the folks that did the MGT report aware of the football teams entrance song at Kyle Field. Laced with MF-Bombs and the N-word? TAMU...The Great Pretender?

Minority representation especially with funding of their clubs or centers is vital to student success. Restart funding of LGBTQ center and other similar ventures

As a former student, and (hopeful) parent of a future student, this is of great importance to me as I want my children to experience the family that I did at A&M. When I read through the report, my concern is that we are being pushed by a minority of the population to change the University's culture. When the campus' identity is viewed as it's strongest asset, how can it also be it's biggest threat. We do need a more diverse University, but we need to find a way to do that without destroying the things that make A&M what it is. I saw no recommendation on how to do that. What I saw was a push to make A&M more liberal, period. They recommended making A&M more like the university of Texas, which to me is just insane. My son, who is a senior in high school applied to Texas A&M because he felt that it was a match for him. He asked to leave the university of Texas, within the first 5 minutes of being there, because the type of energy on that campus just didn't feel right to him. So we talk about diversity, and getting everyone included, but apparently that doesn't mean the kids that have a more conservative view of the world. Those young minds are not seen as valuable, nor is the input that they may have on the future of our society. Where is the inclusivity in that?

TAMU is described as slow to change in this document regarding conservative values and diversity. This is not a bug, it's a feature. When universities around the nation are stooping to explicitly racist diversity quotas, segregation, and flavor of the month radicalism, TAMU should be a lighthouse. You don't mess with tradition, and you don't bend the trend.

As a former student who benefited from student affairs, I don't understand why students are choosing not to participate today?

N/A

Students could be huge champions of Sustainability and Environmental Protection for A&M Operations. They are not. Sustainability should be woven into ALL A&M planning and activities. Their future is being ruined along with the environment, why don't they show more interest in carbon emissions reduction?

Agree with the recommendations from the report

Like

A refocus on student programming is refreshing for this office to maintain and grow in the future.

Student Affairs needs to allow for human contact other than communicating by text messages - you can't call a number and reach a human. This is a recent change that makes it difficult to communicate with TAMU.

None

All three recommendations are great

133 page report on consolidation and operational efficiency improvements (more \$\$\$), nothing focused on improving student experience and time at TAMU. Product should be the best experience for students, maybe more focus should be paid to that instead of rearranging groups to save money.

Certainly, I have seen the struggles with academic advising (having sophomore and junior sons currently at Texas A&M). I have seen the advisor's schedules and how long it takes them to get to meet with them. And the struggle to migrate across majors/schools is incredibly difficult, as you pointed out. There is a huge opportunity for improvement here.

Centralizing advisors is completely out of touch. This is not a business looking for the most profit. Students need advisors that actually understand their major. How can this report mention diversity as the top three threats, but provide no recommendations to counter these threats at all? Was this section meant to be taken out of the final draft, but forgotten about?

No further comments. Not enough information to agree/disagree with recommendations made

Glad to have more training for these Ags.

Step one, get rid of the assistant Vice President job that was made. If reorganizations are going to cost students money, then don't do them. Doing that fails your students and detracts from TAMU. On a side note, the veterans affairs office has issues. I've tried to get information from them and the results have been less than hoped.

The decentralization of elements under Student Affairs may have benefit, but there is nothing in the recommendation about how the reorganization would impact student experience. There are advantages to centralized service providers and the impact/mitigation of those losses is not addressed in the report.

---

Leveraging student affairs for a holistic educational experience seems a fine idea on the surface, but it also seems highly subject to administrative oversight. Again, restructuring seems a fine way to target central values, and the idea for management of student organizations is primed to do much more good than harm, but I feel that some aspects of this approach need to be more firmly planted into the rationale of dynamic progression noted in the report. I would suggest something along the lines of a student interests board- of students, faculty, and other invested parties- that can help to define values and needs of the changing student body (long-term) and keep a sense of accountability for administrative services.

---

The primary goal in all student affairs is retaining and strengthening the Aggie Way. Controlling Fish Camp, for example, is not in the best interests of incoming students. Providing a frame work for Fish Camp would help with consistency but also allow diversity of thought and culture to continue to evolve. However, there must be a base from which everything is established and can be reestablished to that base when necessary. When I first entered A&M there were 26,000 students. I found it a very lonely experience at times. I can only imagine what that experience is like now. With that in mind, I have very little input to provide a solution but that is something that should be thought through and addressed. A more cohesive student affairs should be pursued. It was a mess when I was attending but everyone tried their best to make it work.

---

Please don't bend the knee and go woke. We don't need to rename things and rip down status. The history belongs to all of us both current and former students alike.

---

Student Aid & Counseling should be expanded to cope with the increased stress felt by students.

---

In 2019 I returned to campus for our 50th reunion and I was so impressed with the level of commitment of the student I met and their involvement not only in studies but in various activities on campus. The core values of TAMU have not been lost in the students I met. It made me even more proud to be an Aggies.

---

It is a "positive" to see improvement for diversity, equity, and inclusion. Would like to see an active reach or promotion for legacy enrollment, particularly of minorities. Though there have been legal challenges, there seems to be a work-around at other universities. I was disappointed that my three kids received no communication or "scoring" for possible admission.

---

Support for International students and international programs should be increased on and off campus.

---

Student Affairs should stress being helpful to the overall experience of young Aggies. The idea that always changing just for the sake of changing is not necessary. Subtle changes while keeping Aggie Values at the core should be impreative. Times like the current create a lot of confusion for these young folks.

---

The model suggested related to Student Health is very similar to the more centralized and VERY effective model we have at my jurisdiction in King County, WA. I think this will vastly improve the effectiveness of the work and centralize any research or metrics that the Texas A&M Health conducts.

---

Interesting that the "Money Education Center" prepares students by "expanding financial literacy ... to ensure students are prepared to face debt". Wouldn't it be better to ensure students can get out of student debt as fast as possible or better yet decide whether the degree program they have chosen has absolutely no cost/benefit what so ever? Now that would be a true money education center.

---

The student body of TAMU is not reflective of the demographics of Texas. There are many factors contributing to this. That we continue to have the statue of confederate general at the heart of our campus is not only an embarrassment it is also a detractor to black and other minority students such as those who have a sense of justice.

---
